EXECUTIVE SUMMARY ES-1
- ES.1 Caesars Resort at Suffolk Downs ES-1
- ES.2 Sustainability Elements ES-1
- ES.3 Summary of Environmental Impacts and Mitigation ES-4
  - ES.3.1 Transportation ES-4
  - ES.3.2 Wind ES-5
  - ES.3.3 Shadow ES-6
  - ES.3.4 Air Quality ES-6
  - ES.3.5 Noise ES-6
  - ES.3.6 Wetlands ES-6
  - ES.3.7 Hazardous Materials ES-7
- ES.4 Conclusion ES-7

1.0 CAESARS RESORT AT SUFFOLK DOWNS 1-1
- 1.1 Detailed Project Description 1-3
  - 1.1.1 Project Elements 1-4
    - 1.1.1.1 Casino Area I 1-6
    - 1.1.1.2 Casino Area II 1-6
    - 1.1.1.3 Hotels I and II 1-8
    - 1.1.1.4 Parking Structure 1-8
    - 1.1.1.5 Site Circulation 1-9
    - 1.1.1.6 Route 1A Infrastructure Improvements 1-10
    - 1.1.1.7 Host Community Agreements and Surrounding Community Agreements - Off-Site Improvements 1-10
- 1.2 Public Open Spaces 1-11
- 1.3 MBTA Shuttle and Blue Line Connections and Shuttle Bus Routes 1-12
- 1.4 Pedestrian and Bicycle Connections 1-13
- 1.5 Project Changes since Filing ENF 1-14
- 1.6 Public Benefits 1-15
- 1.7 Public Participation 1-21
- 1.8 Development Context 1-23
- 1.9 Project Alternatives 1-25
  - 1.9.1 Preferred Alternative 1-25
  - 1.9.2 Development Alternative 1 – Mixed Use/Office 1-27
  - 1.9.3 Development Alternative 2 – Primarily Retail 1-27
  - 1.9.4 No Build Alternative 1-28

Table of Contents (Continued)

1.10 Socioeconomics and Environmental Justice 1-29
1.10.1 Requirements of the EEA Environmental Justice Policy 1-30
1.10.2 Actions to Address EJ Populations 1-31
1.10.3 Enhanced Analysis of Impacts and Mitigation 1-32
1.10.4 Other Actions and Approaches to Enhance the Participation of EJ Populations 1-33
1.11 Project Schedule and Phasing 1-35
1.11.1 Phasing Plan 1-35
1.11.2 Construction Schedule 1-35

2.0 COMMITMENT TO GREEN 2-1
2.1 Site and Sustainable Design 2-3
2.2 LEED Credits and Certification 2-6
2.2.1 Sustainable Sites 2-6
2.2.2 Water Efficiency 2-9
2.2.3 Energy and Atmosphere 2-10
2.2.4 Materials and Resources 2-12
2.2.5 Indoor Environmental Quality 2-14
2.2.6 Innovation & Design Processes 2-16
2.2.7 Regional Priority Credits 2-17
2.3 Climate Change and Adaptation 2-18
2.3.1 Integrating Mitigation and Adaptation 2-18
2.3.2 Enhance Emergency Preparedness 2-18
2.3.3 Ecosystem-Based Adaptation 2-19
2.3.4 Climate Change Analysis and Proactive Site Design 2-19
2.3.5 Floodplain 2-21
2.3.6 Sea Level Rise 2-23
2.3.7 Increased Frequency of Storms 2-25
2.4 Energy Conservation 2-25

3.0 REGULATORY AND LEGAL INFORMATION 3-1
3.1 Project Identification and Project Team 3-1
3.2 Regulatory Controls and Permits 3-3
3.2.1 History of Boston Redevelopment Authority and Massachusetts Environmental Policy Act Reviews 3-3
3.2.1.1 City of Boston Article 80 Review 3-3
3.2.1.2 Massachusetts Environmental Policy Act Review 3-3
3.2.2 Anticipated Permits, Reviews, and Approvals 3-4

Table of Contents (Continued)

3.3 State Gaming Process 3-5
3.3.1 Expanded Gaming Act 3-5
3.3.2 Project Application Process 3-7
3.3.3 Host and Surrounding Community Agreements 3-8
3.4 Consistency with Planning 3-8
3.4.1 EO384, Sustainable Development Principles 3-8
3.4.1.1 Concentrate Development and Mix Uses 3-8
3.4.1.2 Advance Equity 3-8
3.4.1.3 Protect Land and Ecosystems 3-8
3.4.1.4 Use Natural Resources Wisely 3-8
3.4.1.5 Provide Transportation Choice 3-9
3.4.1.6 Increase Promote Clean Energy 3-9
3.4.1.7 Increase Job and Business Opportunities 3-9
3.4.1.8 Plan Regionally 3-9
3.4.2 East Boston Master Plan (April 2000) 3-9
3.4.3 City of Revere FY2010-2015 Strategic Plan 3-10
3.4.4 Boston Regional Metropolitan Planning Organization Journey to 2030 3-10
3.5 Zoning 3-11
3.5.1 Revere 3-11
3.5.2 Boston 3-11
3.6 Legal Information 3-12
3.6.1 Legal Judgments Adverse to the Proposed Project 3-12
3.6.2 History of Tax Arrears on Property Owned in Boston by Proponent 3-12
3.6.3 Site Control and Public Easements 3-12
3.7 Coordination with Massachusetts Port Authority, MassDOT and the Federal Aviation Administration on Aviation Issues 3-12

4.0 URBAN DESIGN 4-1
4.1 Existing Urban Context 4-1
4.1.1 East Boston 4-1
4.1.2 Revere 4-2
4.2 Defining the Urban Resort Casino 4-3
4.3 Building Design 4-3
4.3.1 Urban Design Principles 4-4
4.3.2 Massing, Form and Response to Urban Context 4-4
4.3.2.1 Hotel I and Hotel II 4-5
4.3.2.2 Casino Area I and Casino Area II 4-5
4.3.2.3 Parking Structure 4-6

4.3.3 Façade Design Fenestration and Building Materials 4-6
4.3.3.1 Hotel I 4-6
4.3.3.2 Casino Area I and Casino Area II 4-7
4.3.3.3 Parking Structure 4-8
4.4 Site Design and Open Space 4-9
4.4.1 Entry Landscape 4-10
4.4.2 Entry Court 4-11
4.4.3 South Plaza 4-11
4.4.4 North Plaza 4-11
4.4.5 Apron and Track Viewing Landscape 4-11
4.4.6 Racetrack Infield 4-12
4.4.7 Walkways and Pedestrian Connections 4-12
4.4.8 Winthrop Avenue Improvements 4-12
4.4.9 Existing Surface Parking Lots 4-13
4.5 Sustainability and Green Infrastructure 4-13
4.6 Plant Selection 4-13

5.0 TRANSPORTATION 3-1
5.1 Introduction 3-1
5.1.1 Project Overview 3-3
5.1.2 Study Scope 3-4
5.1.3 Key Findings and Project Benefits 3-4
5.1.3.1 Existing Transportation Conditions 3-5
5.1.3.2 Project Travel Characteristics and Trip Generation 3-5
5.1.3.3 Potential Traffic and Transit Impacts 3-6
5.1.3.4 Project Benefits Addressing Existing Local & Regional Transportation Issues 3-7
5.1.3.5 Parking and Transportation Demand Management (TDM) 3-9
5.1.3.6 Sustainable Design Principles 3-9
5.2 2012 Existing Conditions 3-9
5.2.1 Public Transit 3-9
5.2.1.1 Blue Line Rapid Transit Service 3-10
5.2.1.2 Bus Service 3-15
5.2.1.3 Shuttle Buses 3-18
5.2.2 Pedestrian Environment 3-18
5.2.3 Bicycle Accommodations 3-19
5.2.3.1 East Boston Greenway 3-19
5.2.3.2 Chelsea Street and Bennington Street Corridors 3-20
5.2.3.3 Planned Bicycle Infrastructure 3-20
5.2.4 Roadway Network 3-20

	5.2.5	Site Access	3-21
	5.2.6	Study Area	3-21
	5.2.7	Data Collection	3-23
	5.2.8	Existing Daily Traffic Volumes	3-25
	5.2.9	Peak Hour Traffic Volumes	3-27
	5.2.10	Harbor Tunnels Traffic Volumes	3-27
	5.2.11	Existing Project Site Traffic	3-29
	5.2.12	Crash Analysis	3-29
	5.2.13	Parking	3-32
5.3	2022 No-Build Traffic Projections		3-32
	5.3.1	Background Growth	3-32
	5.3.2	Planned Projects	3-33
	5.3.3	Use of Project Site	3-35
	5.3.4	Peak Hour No-Build Traffic Volumes	3-35
5.4	2022 Build Conditions		3-36
	5.4.1	Project Travel Demand	3-36
	5.4.2	Trip Generation Characteristics	3-36
	5.4.3	Trip Generation Methodology	3-38
	5.4.4	Projected Project Person Trips	3-41
	5.4.5	Mode Share and Vehicle Occupancy	3-41
		5.4.5.1 Patrons	3-42
		5.4.5.2 Employees	3-42
	5.4.6	Projected Project Trips	3-43
	5.4.7	Vehicular Trip Distribution & Assignment	3-45
	5.4.8	Build Condition Traffic Volumes	3-48
5.5	Route 1A and Site Access Alternatives Analysis		3-49
	5.5.1	Option 1 – At-Grade Solution, Standard Design	3-51
	5.5.2	Option 4 – Flyover Solution, East of Existing Route 1A Corridor	3-53
	5.5.3	Option 4B – Flyover Solution, East of Existing Route 1A Corridor	3-54
	5.5.4	Option 8 – Northbound Flyover Constructed within Existing NB Travel Way, C/D Fully to East (Southbound flyover later by others)	3-59
	5.5.5	Option 7 – Multiple Flyover Alternative at Boardman and Tomasello/Jughandle (Southbound flyovers later by others)	3-63
	5.5.6	Option 11 – Modified At-Grade Alternative	3-67
	5.5.7	Option 12 – Left Turn Flyovers at Various Locations, all Through-Movements At-Grade	3-73
	5.5.8	Option 13 – Boardman Street At-Grade, Reverse Jughandle and Relocation of Northbound Left Turns	3-81
	5.5.9	Alternatives Analysis Evaluation Criteria	3-84

Table of Contents (Continued)

5.6 Host Community Agreement Traffic and Safety Improvements 3-86
5.6.1 Revere Beach Parkway Corridor 3-87
5.6.1.1 Route 1 at Route 16 3-87
5.6.1.2 Route 1/Route 16 Long Range Plan 3-89
5.6.1.3 Route 16, Route 145, Harris Street 3-90
5.6.1.4 Winthrop Avenue/Revere Beach Parkway at North Shore Road and Tomasello Drive 3-90
5.6.2 Specific City of Revere Locations 3-91
5.6.2.1 Mahoney Circle (Bell Circle) 3-91
5.6.2.2 Brown Circle 3-91
5.6.2.3 Route 60 at Revere Street 3-92
5.6.2.4 Donnelly Square (Bennington Street at Winthrop Avenue), including Bennington Street at Crescent Avenue 3-92
5.6.3 Specific City of Boston Locations 3-93
5.6.3.1 Bennington Street at Saratoga Street 3-93
5.6.3.2 Boardman Street at Saratoga Street 3-93
5.6.3.3 Chelsea Street Corridor from Neptune Road to Frankfort Street 3-94
5.6.3.4 Route 1A SB at Curtis Street 3-94
5.6.3.5 Route 1A Planning Study 3-95
5.6.3.6 Bennington Street Corridor "Constitution Beach to Revere Beach" Bicycle Connection 3-95
5.7 Traffic Operations Analysis 3-96
5.7.1 Signalized and Unsignalized Intersections 3-96
5.7.2 Roundabout/Rotary Analysis 3-116
5.7.3 Merge/Weave Interchange Analysis 3-118
5.7.4 Harbor Tunnel Operations 3-122
5.7.5 Critical Operational Analysis with HCA Improvements 3-124
5.8 Alternative Modes of Transportation 3-127
5.8.1 Transit 3-127
5.8.1.1 MBTA Blue Line Ridership Build Analysis 3-128
5.8.1.2 MBTA Blue Line Capacity Analysis – Build Conditions 3-131
5.8.1.3 MBTA Bus Ridership, Build conditions 3-132
5.8.2 Pedestrian Access 3-133
5.8.3 Bicycle Access 3-134
5.8.3.1 Bennington Street Corridor connection to Revere Beach 3-134
5.8.3.2 Site Accommodations 3-135
5.8.4 High Occupancy Vehicle Shuttle Plan 3-135

Table of Contents (Continued)

5.9 Transportation Demand Management 3-136
5.9.1 Regulatory Context 3-137
5.9.2 Developmental Framework 3-138
5.9.3 TDM Measures – By Land Use 3-139
5.9.4 Supporting Site Design and Program Elements 3-139
5.9.5 Summary of TDM Elements 3-140
5.10 Parking 3-144
5.10.1 Project Parking Supply 3-144
5.10.2 Project Patron Parking Demand 3-145
5.10.3 Employee Parking 3-145

6.0 ENVIRONMENTAL PROTECTION COMPONENT 6-1
6.1 Wind 6-1
6.1.1 Overview 6-1
6.1.2 Methodology 6-2
6.1.3 Pedestrian Wind Comfort Criteria 6-3
6.1.4 Test Results 6-3
6.1.4.1 No Build Configuration 6-4
6.1.4.2 Build Configuration 6-4
6.1.5 Conclusion 6-5
6.2 Shadow 6-6
6.2.1 Vernal Equinox (March 21) 6-6
6.2.2 Summer Solstice (June 21) 6-7
6.2.3 Autumnal Equinox (September 21) 6-7
6.2.4 Winter Solstice (December 21) 6-8
6.2.5 Conclusions 6-9
6.3 Daylight Analysis 6-9
6.3.1 Methodology 6-9
6.3.2 Daylight Analysis Results 6-10
6.3.3 Conclusions 6-11
6.4 Solar Glare 6-12
6.5 Air Quality 6-12
6.5.1 Introduction 6-12
6.5.2 National Ambient Air Quality Standards 6-13
6.5.3 Existing Air Quality and Background Concentrations 6-14
6.5.3.1 Existing Local and Regional Air Quality 6-14
6.5.3.2 Background Concentrations 6-15
6.5.4 Methodology 6-17
6.5.4.1 Mesoscale/GHG Analysis 6-17
6.5.4.2 Microscale Analysis 6-18
6.5.4.3 Stationary Source Analysis 6-21

	6.5.5	Air Quality Analysis Results	6-26
		6.5.5.1 Mesoscale Analysis	6-26
		6.5.5.2 Microscale Analysis	6-27
		6.5.5.3 Stationary Source Analysis	6-32
	6.5.6	Conclusions	6-33
		6.5.6.1 Mesoscale Analysis	6-33
		6.5.6.2 Microscale Analysis	6-33
		6.5.6.3 Stationary Source Analysis	6-34
	6.5.7	Stationary Source Permitting	6-34
		6.5.7.1 Combined Heat and Power	6-34
		6.5.7.2 Boilers	6-34
		6.5.7.3 Emergency Generators	6-34
		6.5.7.4 Parking Garage Exhausts	6-35
	6.5.8	General Air Quality Mitigation Measures	6-35
	6.5.9	Construction Air Quality	6-35
6.6	Noise		6-35
	6.6.1	Noise Terminology	6-36
	6.6.2	Noise Regulations and Criteria	6-37
		6.6.2.1 City of Boston Zoning District Noise Standards	6-37
		6.6.2.2 MassDEP Noise Policy	6-39
		6.6.2.3 U.S. EPA Guidelines	6-39
		6.6.2.4 HUD Environmental Criteria and Standards	6-40
		6.6.2.5 U.S. DOT FHWA Noise Abatement Criteria	6-40
	6.6.3	Existing Conditions	6-41
		6.6.3.1 Baseline Noise Environment	6-41
		6.6.3.2 Noise Monitoring Locations	6-41
		6.6.3.3 Noise Monitoring Methodology	6-43
		6.6.3.4 Noise Monitoring Equipment	6-44
		6.6.3.5 Measured Background Noise Levels	6-44
	6.6.4	Future Conditions	6-46
		6.6.4.1 Stationary Sources	6-46
		6.6.4.2 Mobile Sources	6-52
		6.6.4.3 Construction	6-57
	6.6.5	Conclusions	6-61
6.7	Public Benefit Review and Determination		6-62
	6.7.1	Nature of Affected Tidelands	6-62
	6.7.2	Public Benefit of Project	6-62
		6.7.2.1 Purpose and Effect of the Development	6-63
		6.7.2.2 Impact on Abutters and Surrounding Community	6-63
		6.7.2.3 Enhancement to Property	6-64

6.7.2.4 Benefits to Public Trust Rights in Tidelands or Other Associated Rights 6-64
6.7.2.5 Community Activities on the Development Site 6-66
6.7.2.6 Environmental Protection and Preservation 6-67
6.7.2.7 Public Health and Safety, and General Welfare 6-67
6.8 Consistency with Policies of the Office of Coastal Zone Management 6-68
6.8.1 Jurisdiction for Federal Consistency Certification 6-68
6.8.2 Certification of Consistency with MCZM Program Policies 6-69
6.8.2.1 Water Quality 6-69
6.8.2.2 Habitat 6-70
6.8.2.3 Protected Areas 6-71
6.8.2.4 Coastal Hazards 6-72
6.8.2.5 Port and Harbor Infrastructure 6-73
6.8.2.6 Public Access 6-74
6.8.2.7 Energy 6-75
6.8.2.8 Ocean Resources 6-76
6.8.2.9 Growth Management 6-76
6.8.3 Conclusion 6-77
6.9 Wetlands 6-77
6.9.1 Description of On-Site Wetland Resource Areas 6-77
6.9.1.1 Significance of On-Site Wetland Resource Areas Under the Wetlands Protection Act 6-82
6.9.1.2 Activities Proposed in On-Site Wetland Resource Areas 6-82
6.9.1.3 Compliance with Wetlands Protection Act General Performance Standards for On-Site Activities 6-84
6.9.2 Off-Site Wetland Resource Areas 6-89
6.9.2.1 Roadway Improvements and Potential Wetland Impacts to OSW1 6-91
6.9.2.2 Roadway Improvements and Potential Wetland Impacts of OSW2 6-91
6.9.2.3 Roadway Improvements and Potential Wetland Impacts of OSW3 6-92
6.9.2.4 Roadway Improvements and Potential Wetland Impacts of OSW4 6-92
6.10 Geotechnical Impacts and Groundwater 6-92
6.10.1 Subsurface Conditions 6-93
6.10.2 Groundwater Conditions 6-93
6.10.3 Excavation and Building Foundation Construction 6-94
6.10.4 Project Plans and Specifications 6-95

6.11 Hazardous Materials and Solid Waste 6-95
6.11.1 Regulatory Status 6-96
6.11.2 Project Health & Safety Plans 6-96
6.11.3 Soil Management 6-97
6.11.4 Vapor Intrusion 6-97
6.11.5 Underground Storage Tanks 6-97
6.11.6 Summary 6-98
6.12 Detailed Construction Schedule 6-98

7.0 GREENHOUSE GAS ANALYSIS 7-1
7.1 Introduction 7-1
7.1.1 GHG Policy Summary 7-1
7.1.2 Mitigation Technologies 7-2
7.1.3 GHG Analysis Organization 7-3
7.2 Project Design 7-5
7.2.1 Overview 7-5
7.2.2 Building Envelope 7-6
7.2.2.1 Orientation 7-6
7.2.2.2 High Performance Shell 7-7
7.2.2.3 Reflective Roofs 7-7
7.2.2.4 Shading Devices 7-7
7.2.3 Energy Supply 7-8
7.2.3.1 Space Heating 7-8
7.2.3.2 CHP and Thermal Storage 7-8
7.2.3.3 Domestic Hot Water 7-8
7.2.3.4 Chilled Water 7-9
7.2.3.5 PV Electricity Generation 7-9
7.2.3.6 Uninterruptible Power Supply (UPS) 7-11
7.2.4 Ventilation 7-11
7.2.5 Lighting 7-12
7.2.5.1 Natural Lighting & Advanced Lighting Controls 7-12
7.2.5.2 Room Occupancy Sensors 7-12
7.2.5.3 High Performance Lighting 7-12
7.2.5.4 High Performance Lighting, Exterior and Signage 7-13
7.2.6 Other Process Loads 7-13
7.2.6.1 Energy-Star Appliances 7-13
7.2.6.2 Advanced Elevators 7-13
7.2.6.3 Gaming Machines 7-13
7.2.7 Water Use Reductions 7-14
7.2.7.1 Low Flow Fixtures 7-14
7.2.7.2 Condensate Recovery 7-14

7.2.7.3 Rainwater Harvesting 7-14
7.2.7.4 Drought Tolerant Landscaping 7-14
7.2.8 Other Related 7-15
7.2.8.1 Influence with Tenants 7-15
7.2.8.2 Recycling Areas 7-16
7.2.8.3 Organic Waste Separation 7-16
7.2.8.4 Energy Management System (EMS) 7-16
7.2.8.5 Enhanced Building Commissioning 7-17
7.2.8.6 Construction Waste Management 7-17
7.2.8.7 Recycled Content Materials 7-17
7.2.8.8 Regional Materials 7-17
7.3 Energy Modeling 7-17
7.3.1 Stationary Sources 7-17
7.3.2 Water and Wastewater-related Emissions Reductions 7-20
7.3.3 Other Stationary Source GHG Emissions Reductions 7-22
7.4 Technologies Not Currently in the Design 7-23
7.4.1 Building Envelope 7-23
7.4.1.1 Green Roof/Podium Areas 7-23
7.4.2 MEP Systems 7-23
7.4.2.1 Solar Hot Water 7-23
7.4.2.2 Ground Source Heat Pumps 7-23
7.4.2.3 CHP 7-24
7.4.2.4 Fuel Cells 7-30
7.4.2.5 District Heating/Cooling 7-30
7.4.2.6 Wind Turbines 7-30
7.4.2.7 Water Source Heat Pumps for the Hotels 7-31
7.4.2.8 Anaerobic Digestion and/or Composting of Organic Waste 7-32
7.4.2.9 Kinetic Energy Recovery from Vehicle Traffic 7-34
7.4.3 Other Related 7-35
7.4.3.1 Enhanced Refrigerant Management 7-35
7.5 Transportation 7-36
7.5.1 Fleet Vehicles 7-36
7.5.2 Traffic-related 7-38
7.5.3 Redirected Customers 7-41
7.6 Summary and Mitigation Commitments 7-41
7.6.1 Project GHG Summary 7-41
7.6.2 Proponent's Commitments to GHG Reduction 7-42

Executive Summary

EXECUTIVE SUMMARY

ES.1 Caesars Resort at Suffolk Downs

The Proponent is committed to setting the standard of excellence for gaming resorts in the Commonwealth of Massachusetts across a range of key areas. Central to achieving this new standard, the Project will be the most sustainably designed and built gaming development project in the world. The Proponent has developed a comprehensive program to ensure it is the leader in this area, beginning with the commitments it has made to its host communities of Boston and Revere.

The Resort will be energy-efficient, environmentally conscious, and healthy for employees and visitors. Achieving LEED Gold certification will make the Project only the second casino in the world to reach that designation, and the only one with an integrated hotel and other amenities. The operator of the proposed Resort operates more than 50 properties around the world and has a well-documented and recognized leadership role in sustainability across its footprint. Since 2008, Caesars Entertainment has been recognized with more than 60 awards and distinctions for its sustainability efforts from organizations including the U.S. Environmental Protection Agency, Audubon International, and the American Gaming Association.

In addition to the sustainable design, the Project will generate extraordinary public benefits, the foremost being the creation of 4,000 permanent jobs and 2,500 construction jobs with local hiring preferences. The Project will also preserve jobs at the property's racing facility in its current use. In addition, the Proponent has committed to significant local road and infrastructure improvements ($42 million to $50 million), $35 million in local capital projects in Boston and Revere as well as improvements to the Suffolk Downs MBTA Station, and the preservation and improvement of open space accessible to the public.

ES.2 Sustainability Elements

The Proponent is committed to creating the greenest, most sustainable casino development in the world. To achieve this, many innovative, creative, and sustainable features are included in the Project design and configuration. These features, which are discussed in detail within this filing, include the Project's energy demand, water use, and overall site design. This Project's environmental standards would be high for any development of its size, but are particularly so for the development of a casino resort, a 24-hour use that is typically a large consumer of energy and other resources.

Energy, Innovative Design Measures, and Greenhouse Gas Emissions Reduction

The Proponent is incorporating leading-edge technology and innovative design and materials to conserve energy and reduce potential greenhouse gas emissions. These measures are illustrated in Figure ES-1.

- Anaerobic Digestion: The Resort has signed on as an "anchor tenant" for Massachusetts-based Harvest Power enabling the recovery of approximately 3,100 tons of food waste from the Resort annually that will produce nearly 850,000 kWh of net energy. The Resort's central processing facility is being designed to separate all organic waste for the digester.

- A Central Utility Plant will include two combined heat and power units. These units will provide utility services for the entire Resort, including approximately 5% of the Resort's electricity, 100% of its domestic hot water, and 30% of its heating needs.

- Solar: The Project design includes a large approximately 2.7 MW photovoltaic system, of which approximately 1.45 MW will be building-mounted, one of the largest private building-mounted arrays in the northeast United States. The PV system will produce at least 10% of the Resort's electricity (see Figure ES-2). In addition, Renewable Energy Credits will be purchased so at least 35% of the buildings' electricity consumption will come from renewable sources.

- LED lighting: The Project will install these fixtures in both indoor and outdoor applications throughout the Resort to reduce overall energy consumption and thermal load.

- Heat Recovery Ventilation: Heat recovery will be used to pre-treat incoming make-up air by capturing latent heat in outgoing exhaust air. This "recycling" of heat energy that would otherwise be wasted allows for much greater system efficiency by reducing the amount of energy needed to heat or cool incoming air.

- Occupancy-based controls: These controls will allow the Resort to optimize system performance to reduce energy consumption, and will be included throughout the property, including in hotel guest-room, support offices, and large function rooms.

- Advanced lighting controls in conjunction with architectural daylighting strategies will take advantage of natural light to reduce the need for artificial lighting. These controls will have the ability to automatically decrease artificial lighting when natural light is detected in the space.

Water Conservation

The Proponent is incorporating several key tactics to reduce, recycle, and manage water consumption on the Project site. Water management tactics are illustrated in Figure ES-3.

- Rainwater harvesting: Every drop of water falling onto casino rooftops and about 50% of water falling onto the garage rooftop will be directed towards one of three rainwater harvesting tanks with a combined capacity of 270,000 gallons, reducing potable water demand by up to 4.5 million gallons annually (see Figure ES-4).

- Low-flow or waterless plumbing fixtures and other water conservation measures will reduce water use by approximately 30%, resulting in an annual water use reduction of approximately 4.0 million gallons.

- A high-efficiency irrigation system, together with plantings of native, drought-tolerant vegetation, will target a 50% reduction in potable water use when compared to a mid-summer baseline.

Open Space, Activation, and Site Design

The creation of public open space and the reduction of impervious surface were key design considerations for the Project. As a result of these efforts:

- Open space will increase by approximately 16 acres with a diversity of spaces ranging from active pedestrian plazas to passive ecological parks, offering a variety of amenities for public use.

- Impervious area will be reduced by approximately 14 acres.

- Improved Water Quality: Low-impact design and primary treatment Best Management Practices encompass a new stormwater management system that will improve the quality of discharges, thus benefitting Sales Creek, Belle Isle Marsh, and the Rumney Marshes Area of Critical Environmental Concern (see Figure ES-5).

- A network of pedestrian walkways will connect neighborhoods and visitors to the Resort, promoting circulation and access.

- The Project includes on-street bicycle accommodations to connect Constitution Beach, Belle Isle Marsh, and Revere Beach along the Bennington Street corridor, as well as connections to and through the Project site from the Suffolk Downs MBTA station and from Winthrop Avenue.

- Bicycle Amenities: The Project includes valet bicycle parking, two Hubway stations (when the City expands the Hubway network into East Boston), showers for employees, covered bicycle storage, and short-term bicycle parking.

- Innovative green infrastructure and sustainable systems will use the landscape to purify stormwater, improve soils, and provide educational opportunities.

- The roof of Casino Area II will feature a 5,600-square-foot greenhouse with a hydroponic planting system that will produce, year-round, most of the fresh produce for restaurants in the Resort, thereby reducing demand for delivery trucks.

Climate Change Adaptability and Resiliency

The Project is designed with the capability to function as a safe haven for the community should an extreme event occur. To achieve this, landscape design responds to the threat of sea level rise by elevating buildings, roadways, and access points in a manner that will maintain access and building operations during future coastal storms assuming sea level rise.

- A balanced cut-and-fill soil strategy across the site will increase the capacity of floodplain storage by approximately 60,000 cubic feet.
- A significant portion of Tomasello Drive will be raised above the potential future 100-year coastal storm flood elevation of 18.7 feet that may occur at high tide accounting for sea level rise.
- The Project will reduce stormwater runoff from the site by increasing pervious surfaces and harvesting rainwater from roof areas for reuse.
- First-floor elevations of proposed buildings will be significantly higher than anticipated flood elevations accounting for sea level rise and storm surge.
- Critical mechanical and electrical equipment will be located significantly higher than anticipated flood elevations accounting for sea level rise and storm surge.
- Upper-level windows in the hotel will be operable to provide ventilation in case of power outage.
- Small pumps will be located in lower levels of the parking garage and casino buildings to evacuate stormwater from these areas.
- Space will be reserved for future expansion of the major mechanical and electrical systems if needed to adapt to climate change, for example by adding emergency generators to increase the facility's capability of sheltering the public.

In addition to these sustainability measures, the Proponent is committed to a rigorous Transportation Demand Management (TDM) program, described in detail in Section 5.9.

ES.3 Summary of Environmental Impacts and Mitigation

ES.3.1 Transportation

The Project includes major off-site roadway, traffic, and safety improvements, many of which are expected to address pre-existing regional traffic problems independent of the proposed Project. The proposed Route 1A infrastructure improvements will go far beyond mitigating the potential impacts of Project trips, significantly improving safety and traffic

capacity in the vicinity of the Project site with reduced queuing and delays for both local and regional traffic. New ramp connections at the Route 1/Route 16 interchange and improvements at other strategic locations along the Revere Beach Parkway corridor are expected to address existing regional traffic and safety problems and relieve the Route 60 corridor through Revere. Traffic, roadway, and safety infrastructure improvements to address existing conditions will be provided at numerous other local intersections in Boston and Revere, some of which are expected to experience limited or minimal Project impacts.

The Proponent is also committed to implementing a robust Transportation Demand Management program to reduce single-occupancy vehicle travel, thereby reducing Project parking demand, traffic congestion, and associated environmental impacts. Supported by parking demand management and on- and off-site infrastructure improvements, the program will also promote walking, bicycling, ridesharing, and public transit use. Well-designed pedestrian and bicycle connections to and through the Project site will enhance accommodations for those modes and address pre-existing connectivity and safety issues.

Traffic operations analysis shows limited degradation in overall LOS grades at study area intersections during critical peak periods due to Project impacts. Capacity and operational improvements accrue as the result of proposed roadway improvements, generally providing positive impacts compared to No-Build conditions and, at many locations, Existing conditions.

The Project will generate significant new ridership on the MBTA system, largely on the Blue Line. Use of Suffolk Downs Station will increase substantially but will remain within the capacity of this extremely under-utilized station. Project-related ridership can be accommodated within the MBTA's service delivery policy, with the exception of limited times in the late evening on Thursdays and Fridays. Adverse impacts to MBTA bus capacity and operations are not expected.

With 5,100 proposed spaces, on-site parking will be less than under existing conditions, and will adequately accommodate the Project's peak parking demand. Employee parking will be accommodated as part of the Resort's extensive ground shuttle operation.

ES.3.2 Wind

The pedestrian wind analysis (see Section 6.1) demonstrates that shelter provided by the proposed Project is expected to significantly improve wind conditions over the Project site. As a result, many previously uncomfortable wind conditions are predicted to be comfortable for walking or better once the development is complete. Furthermore, the Project is not expected to have a significant negative effect in any of the surrounding areas. On the contrary, construction of the proposed Project is expected to reduce wind speeds in most surrounding areas, most significantly along Tomasello Drive southeast of the existing shopping plaza.

ES.3.3 Shadow

The shadow analysis (see Section 6.2) demonstrates that new shadow impacts from the Resort will be minimal, and will not affect any sensitive areas off-site. Likewise, the network of pathways throughout the entry landscape will be unaffected by new shadow, as will most of the open spaces on the Project site.

ES.3.4 Air Quality

Results of the microscale analysis show that all predicted carbon monoxide concentrations are well below one-hour and eight-hour National Ambient Air Quality Standards (NAAQS). Therefore, it can be concluded that there are no adverse air quality impacts resulting from increased traffic in the area. Results of the stationary source air quality dispersion modeling analysis show that all predicted concentrations are well below the NAAQS. Therefore, it can be concluded that the stationary sources associated with the Project will not cause or contribute to a violation of the NAAQS. Although results of the mesoscale analyses (see Section 6.5) show increases in nitrogen oxide and volatile organic compound emissions, the quantitative values (in tons per year) are relatively small (~3 tons per year) between No-Build and Build cases. With the Host Community Agreement improvements, reductions of NOx and VOC are expected from the Build case.

ES.3.5 Noise

Based on a detailed noise analysis (see Section 6.6), with appropriate mitigation, the Resort is expected to meet the City of Boston and Massachusetts Department of Environmental Protection noise limits as well as the recommended Environmental Protection Agency and Housing and Urban Development guidelines. In addition, a mobile source analysis of future traffic impacts indicates that sound levels due to increases in traffic volumes associated with the Resort will meet the applicable Federal Highway Administration noise criteria at each of the nearest residences and community receptors. Furthermore, an analysis of construction noise resulting from the operation of diesel-powered equipment indicates that the Resort is expected to meet the applicable City of Boston construction noise limits during daytime construction hours. In conclusion, results of these analyses indicate that predicted sound levels due to stationary mechanical equipment, increased traffic volumes, and temporary construction activities are not anticipated to cause a significant noise impact on the surrounding community, and, with appropriate mitigation, are expected to meet relevant noise limits at all noise-sensitive locations.

ES.3.6 Wetlands

The Project site does not contain any areas of Priority Habitat or Estimated Habitat for state-listed species. There are also no mapped certified or potentially certifiable vernal pools located on or near the Project site. A portion of on-site activities will occur within Bordering Land Subject to Flooding (BLSF) and the 25-foot Riverfront Area (RFA) associated with Sales Creek. No work is proposed in Bordering Vegetated Wetland (BVW), Inland

Bank, or Land Under Water (LUW). Although the Project will fill some areas of BLSF, the site design calls for more cutting than filling, and these activities will result in a net *increase* in approximately 60,000 cubic feet of floodplain storage. The additional flood storage areas will be designed to comply with Wetlands Protection Act (WPA) performance standards for BLSF. With regard to the Sales Creek RFA, activities in this location are limited to proposed stormwater management system improvements and upgrades and construction of a small floodplain compensatory storage area adjacent to Sales Creek at the north end of the site.

Off-site infrastructure improvements will occur in proximity to LUW, Inland Bank, BVW, RFA, Salt Marsh, and/or Coastal Bank (see Section 6.9.2). Impacts, if required, can be allowed under the limited project provision cited at 310 CMR 10.24(7)(c)(1) of the WPA Regulations, which allows for maintenance and improvement of existing public roadways (including widening less than a single lane and adding shoulders). As required by the limited project provision, the proposed work will not adversely impact habitat of rare vertebrate or invertebrate species.

ES.3.7 Hazardous Materials

Completion of a subsurface investigation, sampling, and testing program of soil and groundwater media and a Method 3 Risk Characterization found that a condition of No Significant Risk to human health or the environment exists at the release areas of the site, and No Significant Risk was identified both for current and future hypothetical residential uses. No Activity and Use Limitation has been placed on the property. Additional subsurface investigations with soil and groundwater sampling and testing were completed in 2007. Based on the findings, it was concluded that no new MCP reportable conditions exist with respect to soil or groundwater. Haley & Aldrich has been engaged by the property owner to provide environmental consulting services during Project design and construction. If contamination is identified in pre-construction sampling or during construction, a Licensed Site Professional (LSP) will provide services consistent with the MCP as required for regulatory compliance and close-out.

ES.4 Conclusion

The Proponent's commitment to developing a world-class, environmentally-conscious Resort is manifested in the myriad of sustainable elements incorporated into its design. Together with the numerous extraordinary public benefits promised by the Project, the Resort will be a good neighbor locally and an important asset regionally. A detailed Project description, various environmental analyses, and proposed mitigation measures are all described in detail in the Draft Environmental Impact Report/Expanded Project Notification Form.

Section 1.0

Caesars Resort at Suffolk Downs

1.0 CAESARS RESORT AT SUFFOLK DOWNS

Caesars Resort at Suffolk Downs is a redevelopment proposed on approximately 161 acres of land in East Boston and Revere (see Figures 1-1 and 1-2 [note that all figures are included in Volume II, Project Figures]). Of the 161 acres comprising the site, approximately 116 are located in Boston and approximately 45 are located in Revere. To the west, the property is bordered by a retail shopping plaza, properties containing fuel storage tanks owned by Irving Oil Terminals Inc. and Global Petroleum, and McClellan Highway (Route 1A). Winthrop Avenue is located to the north of the Project site. The neighborhood north of Winthrop Avenue is Crescent Beach, which in turn borders Revere Beach and the Atlantic Ocean; the Project site is located less than one mile from the beach. The MBTA Blue Line and Bennington Street lie east of the Project site, and Waldemar Avenue is at the southern boundary. Orient Heights is the residential neighborhood located immediately south of the Project site.

The portion of the Project site located within Boston is within the East Boston Neighborhood District and is zoned as the Suffolk Downs Economic Development Area (EDA), the purpose of which is to "encourage sound development and growth that will expand the City's economic base and afford broad employment opportunities." The site is also included in a Special Study Overlay Area that overlays the EDA.

The main access points to the site are from Route 1A to the west and Tomasello Drive as well as from Winthrop Avenue at the north end of the property. Two mass transit stops on the MBTA Blue Line (Suffolk Downs and Beachmont stations) currently serve the Project site. Parallel to the train tracks is Bennington Street, which connects East Boston to the City of Revere and is a key route for access to the Town of Winthrop (via Saratoga Street, Route 145). Beyond Bennington Street lies the Belle Isle Reservation where the Massachusetts Department of Conservation and Recreation (DCR) manages a 28-acre park with pathways, benches, and an observation tower; the reservation is part of the 241-acre Belle Isle Marsh, the last remaining salt marsh in Boston.

Sales Creek is associated with the Belle Isle Inlet and Rumney Marshes Area of Critical Environmental Concern (ACEC) and extends through the Project site, primarily as a manmade drainage channel, from approximately the northwest corner of the site, passing between the proposed construction and the existing horse barns, through the northern portion of the racing track infield, and continuing east of the Project site (see Figure 1-3). Areas north of Sales Creek house stables for the ongoing racing program.

The property is currently home to Suffolk Downs, which opened in 1935 and remains New England's only operating thoroughbred racetrack. Historically, the Project site has hosted as many as 40,000 patrons and contained as many as 12,000 parking spaces (see Figure 1-4). Racetrack operations require approximately 63 acres for a one-mile oval racing surface and related open space, all of which exist in an urban environment. The maintenance of this open space and related view corridor is an important community amenity. Existing conditions are shown in Figure 1-5.

This Draft Environmental Impact Report (DEIR)/Expanded Project Notification Form (EPNF) has been prepared in response to comment letters received on the Environmental Notification Form (ENF) submitted to the Massachusetts Environmental Policy Act (MEPA) Office on January 31, 2013 as well as discussions with MEPA, the cities of Boston (including the Boston Redevelopment Authority [BRA]) and Revere, and other state and local agencies. The Secretary of the Executive Office of Energy and Environmental Affairs' (EEA) Certificate on the ENF is provided in Section 11.0 along with each of the comment letters received on the Project.

Caesars Resort at Suffolk Downs provides a unique opportunity for the cities of Boston and Revere to create a world class entertainment complex located minutes from the heart of downtown Boston and Logan International Airport. Caesars Entertainment's commitment to sustainably developing the expansive 161-acre site in partnership with the cities of Boston and Revere and surrounding communities is the foundation for many of the unique elements of this Project. While some of the Project's concepts are well known, its sheer size and scope set it apart from many other world class urban casino developments.

In terms of distinguishing this Project from others, first and foremost is its restorative approach to the landscape. By embracing the history and natural ecology of the existing site, the proposed 1.8 million square feet of development will be achieved while also creating 16 additional acres of open space for public use and enjoyment as well as converting 14 acres of impervious area into pervious surfaces. Pedestrian and bike paths will be infused through the landscape, transforming the existing site and better connecting it with other open space areas. The Project will also preserve the long-term viability of the horse racing industry in Massachusetts, an industry that provides a substantial number of jobs in the Commonwealth, farms and open space. Preserving this industry is a stated goal of the Massachusetts Gaming Commission, as it fulfills its mandate to expand gaming opportunities in Massachusetts.

The Proponent believes the most compelling destination resort casinos (i.e., those that provide the maximum value to host and surrounding communities as well as their own patrons) are integrated into a destination's existing infrastructure and its restaurant, entertainment, hospitality, and recreational offerings. As such, the Project is being designed to emphasize linkages with existing local and regional attractions and services, and these community assets will benefit from the Resort's ability to attract tourists and local visitors. Another component unique to this development is the inclusion of engaging ground-floor program spaces along the perimeter street edges of the two casino areas. Program elements such as restaurants, retail, and hotel lobbies have been consciously designed and placed along the new street grid. Three plazas with universal access to the major entry points will provide opportunities for terraces and outdoor seating to engage at a pedestrian scale. The apron along the racetrack will also be redesigned to create a pedestrian connection from the grandstand to the clubhouse. An elegant terraced green space will provide amphitheater-style seating for viewing races and other special events held at the track.

Conservation is the cornerstone of responsible sustainable development, and the Proponent is committed to an integrated design approach that incorporates state-of-the-art technologies to preserve natural resources. The proposed design is estimated to consume up to a third less energy

than a standard development of similar size. In addition to conservation and efficiency measures, an approximately 2.7 MW solar array system will be deployed to generate on-site electricity. Approximately 1.45 MW of this system will be building-mounted, one of the largest private building-mounted systems in the northeast United States. Solar panels and supporting structures will be integrated into the building and landscape design to provide both shade and covered pedestrian walkways. These prominent elements will serve as visual reminders of the Proponent's commitment to responsible stewardship and sustainable design.

This section contains a detailed description of the proposed Project in terms of the development program, public open spaces, public benefits, and sustainable design. Also included are descriptions of the development context for the Project, Project alternatives, and the development schedule.

1.1 Detailed Project Description

Caesars Resort at Suffolk Downs presents a unique opportunity to re-energize the Project area with a mixed-use urban resort casino development. The Resort (see Figure 1-6) will bring extraordinary new investment to the cities of Boston and Revere, will increase government revenue, and will provide new permanent employment opportunities for residents of the host cities and other local communities. Furthermore, pursuant to M.G.L. chapter 23K, a portion of the taxes on the Resort's gross gaming revenue will be allocated to a community mitigation fund, from which the Massachusetts Gaming Commission will allocate funds to the cities of Boston and Revere and others to address potential Project impacts. In addition to new jobs, public funding, and direct investment at Suffolk Downs, the proposed Resort will promote small business and the tourism industry and have positive economic effects on the host cities and the Commonwealth of Massachusetts. Locating a Category I gaming establishment at the Project site will enable patrons to enjoy both the gaming establishment and the unique cultural, historical, environmental, and social resources of Boston and Revere, and will result in additional enjoyment of and support for those resources.

As more particularly described below, the Project program includes two distinct casino gaming areas (referred to herein as Casino Area I and Casino Area II), approximately 450 guestrooms in two hotels, multi-purpose meeting/entertainment space, dedicated structured parking as well as some surface parking, fine dining, retail space, and sports bars (see Figure 1-7, Proposed Site Plan). The Proponent proposes to construct substantial infrastructure improvements on Route 1A in the vicinity of the Project site as an integral part of the Project, and the Project also includes a number of other transportation-related improvements at key locations in the general area. These improvements are described in detail in the transportation section, Section 5.0. Project elements are described in more detail below.

1.1.1 Project Elements

Proposed Project elements consist of the following:

- Two hotels: an approximately 300-room hotel (Hotel I) and an approximately 150-room hotel (Hotel II);
- Multi-purpose meeting/entertainment space;
- Dining: approximately 15 restaurants, including six fine dining concepts, casual outlets, a Streets of Boston restaurant pavilion, and sports bars;
- Gaming Space: approximately 220,000 square feet of gaming space containing 4,000-5,000 slot machines, 200 table games, and a World Series of Poker™ room;
- Retail: approximately 30,000 square feet;
- Central Utility Plant (CUP);
- Parking: an approximately 2,550-space, six-story parking garage, approximately 2,090 surface parking spaces, and approximately 460 below-grade spaces for valet parking (total parking 5,100); and
- Maintenance building.

The Project also involves continued operations at the Suffolk Downs racetrack as well as ongoing maintenance in the existing horse barn area, which will include replacing or improving horse barns as necessary due to deteriorated conditions. As shown in Table 1-1, the Project involves both renovation and new construction. Figure 1-8 shows a view of the proposed development from the Orient Heights neighborhood, while Figures 1-9 through 1-12 illustrate the Entry Drive, North Plaza, Route 1A, and Winthrop Avenue arrivals, respectively. Floor plans are provided as Figures 1-13 through 1-17; a roof plan is shown as Figure 1-18.

The Proponent is committed to developing a Resort that is sustainably designed, energy efficient, environmentally conscious, and healthy for its employees and visitors. Pursuant to Article 37 of the Boston Zoning Code and the Expanded Gaming Act, the Proponent is committed to achieving Gold certification in the U.S. Green Building Council's (USGBC'S) Leadership in Energy and Environmental Design (LEED) program for this Project (see Section 2.2).

Table 1-1 Proposed Project Program

Proposed	*Gross Square Footage (approx.)*
Renovation	
Casino Area I (Existing Grandstand)	114,177
Restaurants (3) and Bars (3)	39,840
Support and Back-of-House	54,688
Racing & Racing Support (Clubhouse and Link)	119,313
Loading	3,200
Unrenovated Space	6,730
subtotal	*337,948*
New Construction	
Casino Area II	104,840
Hotel I (300 keys)	223,140
Restaurants (5) and Bars (4)	34,600
Entertainment Space	38,110
Greenhouse	5,656
Retail (within parking structure)	30,000
Spa and Gym	10,000
Support and Back-of-House	55,957
Loading	2,920
Parking Structure	840,880
subtotal Casino Area II (also called the principle casino area)	*1,346,103*
Hotel II (150 keys)	130,000
Maintenance Building	12,000
subtotal new construction	*1,620,603*
GRAND TOTAL	**1,826,051**

*Square footages do not include mechanical spaces per City of Boston zoning.

Proposed parking is identified in Table 1-2 and shown in Figure 1-19.

Table 1-2 Project parking

Area	*Spaces*
Parking garage	2,550
North Lot	1,468
South Lot	413
Valet	460
Barn Area/Horsemen's Lot	209
total	*5,100*

1.1.1.1 Casino Area I

Casino Area I will be housed on the first floor of the existing, re-purposed grandstand, link, and clubhouse buildings on the Project site. In its current design, the first floor will be a gaming floor (i.e., slot machines and table games) that will include a restaurant, sports bar, dedicated poker room, and high-limit gaming area. Figures 1-20 and 1-21 show west elevations of Casino Area I.

The second floor of the grandstand building will be re-purposed to house a Streets of Boston restaurant pavilion and back-of-house support spaces with connections to the grandstand area for racing patrons. The second floor of the adjacent link building will be re-purposed to house gaming offices and additional back-of-house support spaces. A double-bay loading dock and employee service entrance will be located on the north side of the building. Just to the north, a CUP will provide utility services for the entire Resort.

The existing clubhouse, attached to the grandstand building via the link building, will undergo renovations and will continue to house the horse racing program on the second and third levels (see Figure 1-22). Gaming and racing components will be operated jointly and will be fully accessible to patrons. Section 8.0 provides a more detailed description of renovations to the grandstand and clubhouse buildings.

1.1.1.2 Casino Area II

The main entrance of Casino Area II will be centered on the crescent-shaped luxury hotel (i.e., Hotel I), with a lower-story façade that will provide a clear visual connection to the interior of the building; terrace dining will support an urban, pedestrian-friendly environment along the access drive (see Figure 1-23, View of Casino Area II and Hotel I). A glass canopy and porte-cochere (i.e., covered entrance) will accommodate drop-off and valet services for up to 460 guest vehicles and 100 bicycles below-grade.

The main entrance leading directly to the gaming floor of Casino Area II will be flanked by two fine dining restaurants and the Hotel I lobby (see Figure 1-24, Lobby View of Winter Garden). A two-level feature bar and table gaming area will command the center of Casino Area II and will be the main focal point. The feature bar will have a direct visual connection from the main entrance lobby to the south, and from the north escalators leading to the parking garage.

Access to a 25,000-square-foot multi-purpose conference and entertainment space will be provided off the main entry lobby with a grand open stair and escalators. The two-story pre-function lobby will spatially connect function areas with the retail and gaming floor below. In addition, outdoor terraces at the second level will lead to a 5,500-square-foot greenhouse which will provide fresh produce for year-round use in the restaurants. Equipped with a chef's table, the greenhouse will also provide opportunities for culinary and educational demonstrations to showcase for the public what will be one of the many

sustainable features integrated into daily Resort operations. Service access to Casino Area II will be provided through a double-bay loading dock and mechanical area northwest of the gaming floor.

A northern entrance to Casino Area II will provide pedestrian access from a detached seven-story, approximately 2,550-space parking garage. In addition to the on-grade access, an enclosed pedestrian bridge from the garage will lead to a mezzanine level connecting to the gaming level of Casino Area II with open stair and escalators (see Figures 1-25 through 1-28 for Building Elevations and Views). At ground level adjacent to the north entrance of Casino Area II, a glass pavilion ("winter garden") will connect with Casino Area I, creating a primary gathering area; this will be the drop-off point for dedicated charter buses and shuttles from Logan Airport, nearby business districts, and other major tourist, cultural, and travel venues in Boston, Revere, and the surrounding region as well as from the Massachusetts Bay Transportation Authority (MBTA) Suffolk Downs Station. The shuttle program and primary gathering area is a key strategy to Caesars' philosophy of the importance of integrating the surrounding communities into the fabric and essence of the Resort.

The Proponent expects at least 11 percent of visitors and 30 percent of Resort employees to access the site via public transportation, and has endeavored to treat the nearby Suffolk Downs MBTA Station as another "front entrance" to the site. Accordingly, a tree-lined walkway will greet pedestrians arriving from the station on the MBTA Blue Line, and an enhanced shuttle service will provide a direct connection from the station via Blue Line Road to the winter garden and employee entrances. Pedestrian and bicycle access will also be enhanced as important modes of transportation for both patrons and employees.

Consistent with the objectives of the Transportation Demand Management (TDM) plan described in Section 5.9, to discourage employees from commuting by private cars and encourage use of alternative modes such as transit, no employee parking will be provided on the Project site, with the exception of a limited number of spaces for senior management, handicapped employees, and essential staff. The parking plan for staff is based on the use of multiple geographically-dispersed locations remote from the Project site, with employee shuttle service to and from the Resort. This strategy is designed to discourage private auto travel and will result in maximum dispersion of employee auto trips, and will minimize employee vehicle miles travelled (VMT), as employees will choose to park at locations that are most convenient for their commute. Further, it will minimize employee vehicle trips in the vicinity of the Project site, as the majority of employee trips will be intercepted on the roadway network before they reach the Project site area, and therefore will not use the roadway network local to the Project site.

The Proponent proposes to engage a contractor to manage and operate the employee shuttle system, which will run continuously 24 hours per day, seven days a week to serve the continuous turnover of multiple shift changes throughout the day. As discussed in Section 5.4, this will also provide a way for employees whose shifts start or end during the period when the MBTA is not operating (roughly 12:30 to 5:30 a.m.) to commute to work.

A shuttle contractor will be responsible for identifying available parking locations and developing the shuttle plan, and it is anticipated that locations could include strategic regional parking facilities such as the Logan Express park-and-ride lots or other existing public commuter parking facilities, key transit and commuter rail hubs, or available private parking facilities.

1.1.1.3 Hotels I and II

The approximately 300-room, nine-story (seven stories of hotel rooms and a two-story podium) luxury hotel (Hotel I) will feature breathtaking views of Boston and the Massachusetts Bay seacoast. On the second floor, guestrooms are being designed to complement the spa interior and provide a unique experience for hotel guests. On the all-suite penthouse level, two large villas will anchor each end of the plan (see Figure 1-17). Each villa will have generous outdoor terraces with panoramic views of the Boston skyline. The current design for Hotel I consists of approximately 253 guestrooms, 45 suites, and 2 villas, although the final room configuration is still in development.

The 12-story Hotel II, which may be developed by a third-party hotel operator, will have approximately 150 guestrooms and a prominent porte-cochere entrance located south of the North Plaza. South-facing guestrooms will have views towards Boston, while and north-facing rooms will overlook the plaza and the Atlantic Ocean. A second-level concourse will connect to the covered bridge providing access to the parking garage.

1.1.1.4 Parking Structure

The proposed parking structure is a six-story standalone structure, approximately 60 feet tall, with one level of below-grade parking and six levels of above-grade parking. The open-air parking structure is sited away from the adjacent neighborhood and will provide approximately 2,550 self-park parking spaces with elevated solar panels above the top parking level (see Figures 1-29 and 1-30 for parking garage elevation views). The top of the garage will be highlighted with a PV canopy that will be part of the approximately 2.7-MW solar array system deployed on-site. The PV canopy will be supported by a thin steel structure integrated into the design of the building. Figure 1-31 shows the site plan including solar panel arrays.

1.1.1.5 Site Circulation

Vehicular access to the Resort will primarily be from two locations: from Winthrop Avenue in Revere, and from Route 1A in Boston. Tomasello Drive will be enhanced and is envisioned as the primary drive providing access to the Resort from entrances in Revere and Boston.

The new Tomasello Drive is envisioned to transform the arrival experience of visitors from the existing deteriorating asphalt pavement to a unique experience along a meandering drive through a restorative marsh-like ecological landscape. From Tomasello Drive, the secondary streets leading visitors to entry plazas of Casino Areas I and II will be lined with street trees and pedestrian sidewalks, creating a ceremonial entry sequence. The network of streets is intended to establish connectivity between the Resort and adjacent neighborhoods and the site's surroundings, and to create a unique arrival sequence and visitor experience that embraces the site's natural setting and outwardly-focused landscape.

Within the site, secondary streets from Tomasello Drive will connect to the hotel and casino drop-off areas as well as the parking garage, creating a framework of streets that will cater to the overall vehicular circulation and seamlessly integrate shuttle buses, potential MBTA bus routes, and service-related traffic (see Figure 1-32, Vehicular Circulation).

The site plan proposes to reduce a considerable amount of existing impervious pavement used for parking. The proposed exterior parking court will be defined with trees to reduce the heat island effect along with shaded walkways to the public spaces and buildings (see Figure 1-19, Site Parking). See Section 4.4.9 for additional information pertaining to surface parking.

The Project site is well served by MBTA Blue Line rapid transit service, as Suffolk Downs Station abuts the site, providing direct access for transit riders and pedestrians alike. A new Blue Line Road is proposed to extend shuttle bus service between the station and racetrack and provide direct connections for patrons and employees. A shared pedestrian and bicycle path is proposed from Suffolk Downs Station to the racetrack and grandstand (see Section 1.4 for a detailed description).

A potential MBTA bus stop may be located along Tomasello Drive to cater to visitors and employees for direct access to the Resort (see Figure 1-33, Potential Bus Circulation).

On-site shuttle bus circulation is proposed for visitors and employees, with pick-up and drop-off locations at key locations. The shuttle bus will pick-up and drop-off from the Suffolk Downs Station to Casino Areas I and II and the racetrack grandstand (see Figure 1-34, Shuttle Bus Routes).

Pedestrian access to the site will be provided through a hierarchy of walkways that are shown on Figure 1-35 (Pedestrian Circulation) and are described in greater detail in Sections 1.4 and 4.4.7.

In conjunction with the future deployment of the East Boston Hubway network, the Proponent is committed to installing two Hubway stations, one at the Suffolk Downs MBTA station and the second near the entrance to Casino Area II, to promote bike access to the site and its surroundings. Proposed bike circulation is shown on Figure 1-36.

The Project will also enhance the landscape and pedestrian experience along Winthrop Avenue, another front door to the Project site. Pedestrian accommodations at the Tomasello Drive intersection will be significantly improved by the introduction of concurrent pedestrian phasing and the provision of a new "missing" crosswalk on Winthrop Avenue east of Tomasello Drive. Also, as described in Section 5.6.2, traffic and pedestrian safety improvements will be implemented in Donnelly Square, which will incorporate streetscape improvements east of Beachmont Station. In addition, the Project will provide plantings for shade and visual interest at the edge of the neighborhood as well as an attractive new fence along the Resort edge. Figure 1-37 depicts a street section along Winthrop Avenue. Section 4.0 contains more detail about the landscape and pedestrian experience on the Project site.

1.1.1.6 Route 1A Infrastructure Improvements

A flyover at the entrance of Route 1A and Boardman Street has been proposed and presented to the community and was included in the ENF as the Proponent's preferred alternative. This proposed option and the other alternatives, which have been developed at the specific request of MassDOT for the purpose of completing an alternatives analysis of the options, are discussed in detail in Section 5.0 and will be referred to throughout this document as Route 1A infrastructure improvements. Section 6.9.2 provides detail on potential wetlands impacts.

1.1.1.7 Host Community Agreements and Surrounding Community Agreements - Off-Site Improvements

Unlike for any other project, the Proponent is required by chapter 23K to have agreements with Host Communities. These Host Community Agreements (HCAs) require the Proponent to undertake certain public improvements that may or may not be required to directly mitigate Project impacts. Because the Proponent has agreed within the East Boston and Revere HCAs to permit, design, and construct some of these improvements, in addition to describing the Route 1A infrastructure improvements and other proposal detailed in Section 5.0, this filing describes potential environmental impacts for the three off-site transportation projects bulleted below.

The analysis of off-site wetlands (see Section 6.9.2) and historic resources (see Section 8.0) includes potential impacts from these off-site projects. The transportation section (see Section 5.0) includes additional detail on transportation and an alternatives analysis. Concept plans for the off-site transportation improvements are provided in Attachment A. Necessary permits for the three off-site transportation projects are included in the permit analysis in Section 3.2. For a complete list of HCA improvements related to transportation, see Section 5.6 and Attachment B.

The Project includes conceptual improvements at various locations along Revere Beach Parkway to address traffic issues and improve traffic flow. The locations include:

- Route 1/Revere Beach Parkway (Route 16);
- Revere Beach Parkway (Route 16)/Winthrop Avenue (Route 145)/Harris Street; and
- Revere Beach Parkway (Route 145)/Tomasello Drive/North Shore Road.

Revere Beach Parkway is under DCR jurisdiction. Route 1, Route 16 northeast of Revere Beach Parkway (Route 145), and North Shore Road are under jurisdiction of the Massachusetts Department of Transportation – Highway Division (MassDOT). Harris Street is within City of Revere jurisdiction, as are other local roads, and Tomasello Drive is a private way.

1.2 Public Open Spaces

The Project design contains a number of public open spaces to activate exterior portions of the site and to offer unique programming opportunities and outdoor leisure. These spaces are described in greater detail in Section 4.4, and are briefly described below:

- A 20-acre Entry Landscape will set the tone for visitors entering the site from Route 1A, and will be comprised of meandering pathways, wetlands, and beautiful landscaping;
- An elegant Entry Court will create a memorable arrival experience and focal point for the Resort;
- At the entry to Casino Areas I and II, the South Plaza will contain native plantings and outdoor café seating to create an active and vibrant space;
- The tree-lined North Plaza will contain some hardscape and permeable pavers as well as a large green area at its center to create a cool oasis for informal gatherings and planned events; and

- An approximately four-acre apron and racetrack viewing landscape will lead from Casino Area I and the grandstand to the edge of the racetrack, and a continuous pedestrian path will allow controlled access along the track and paddock (see Figure 1-38, Program and Land Use Diagram).

1.3 MBTA Shuttle and Blue Line Connections and Shuttle Bus Routes

The Project site is well served by MBTA Blue Line rapid transit service as well as several MBTA bus routes with stops proximate to the site. Suffolk Downs Station abuts the site, providing direct access for transit riders and pedestrians alike. The existing shuttle bus service currently provided between the station and racetrack will be enhanced to provide direct connections for both patrons and employees. Figures 1-39 and 1-40 show planned improvements along Blue Line Road from Suffolk Downs Station.

Although located further from the racetrack, Blue Line service is also accessible at the MBTA's Beachmont Station, and bus stops for MBTA bus routes are located close to the site entrances. The site layout allows for the routing of MBTA bus service through the site and provision of an on-site MBTA bus stop, should the MBTA wish to do so (see Figure 1-33, Potential MBTA Bus Circulation). Public transit services are described in detail in Section 5.2.1. The Proponent will substantially expand the use of alternative modes of transportation through the implementation of an off-site HOV Shuttle Plan operated by a suitably qualified contractor with extensive experience in the Boston region. These shuttle operations will be in addition to the on-site shuttle service connecting the Suffolk Downs MBTA station with the Resort building entrances.

The off-site shuttle plan will be tailored to the distinct needs of employees and patrons. The off-site shuttle plan to accommodate employee commuting needs is described in Section 5.10.3. The shuttle plan for patrons will comprise a diverse range of services to provide alternative transportation for patrons to and from multiple locations. The purpose of the shuttle service goes beyond catering to the needs of patrons and minimizing vehicle trips; it is also intended to stimulate business and tourism in the region by enabling convenient transportation connections to the Resort for tourists, visitors, and business entities, and is a key component of the Proponent's strategy to connect the Resort to its host communities.

A major advantage of an off-site shuttle service is the flexibility with which it can be planned and operated. In essence, it is in the Proponent's interest to provide shuttle service wherever there is demand, and the routing and scheduling of shuttles can be tailored to satisfy such demand. Further, the shuttle plan can be implemented dynamically, responding to changes in need as and when they occur.

Plans for the Resort include the establishment of a ground shuttle service to bring patrons and employees to and from the MBTA, nearby business districts, cultural and tourist attractions, area hotels, and parking locations. The plan advances the goal of minimizing the impact of resort traffic on local roads. In furtherance of the City's long-standing

commitment to improving air quality through the promotion of public transit and the utilization of clean fuel technologies, the Proponent plans to use a fleet of compressed natural gas (CNG), liquefied natural gas (LNG), or other alternative fuel buses in the provision of this service. Use of fuel-efficient and alternative fuel vehicles in this shuttle service can lead to significant greenhouse gas (GHG) emissions savings as well as reductions in other pollutant emissions. The precise types and number of buses to be used is dependent on negotiations with the ground shuttle operator, which are ongoing. Routes and schedules will be developed over time to meet actual demand for these services.

1.4 Pedestrian and Bicycle Connections

Pedestrian access to the Resort will be provided through a hierarchy of walkways that are shown on Figure 1-35 (Pedestrian Circulation). The Project site design includes a network of public pedestrian walkways and bikeways to establish connectivity between the Resort and adjacent neighborhoods and the site's surroundings. These pathways will create a unique arrival sequence and visitor experience that embraces the site's natural setting and outwardly-focused landscape. The site's proximity to the East Boston Greenway and trails of the Belle Isle Marsh offers the opportunity to connect into the greater East Boston network of public open spaces; see Section 4.0 for a more detailed discussion of the Project site context.

All pedestrian areas and pathways are designed to support universal access and to comply with Americans with Disabilities Act (ADA) requirements, and are sized to appropriately accommodate the anticipated volume of users. Site furnishings along pathways will support pedestrian comfort, and pedestrian areas will be well-lit with high-quality lighting fixtures chosen to ensure safety, be energy-efficient, and reduce light pollution (i.e., full-cutoff). Streetscapes on the site are designed in compliance with Boston and MassDOT Complete Streets standards, while sidewalks and bikeways along roadways are designed in smooth materials to comply with ADA regulations.

Attractive, shaded multi-use pathways for bikes and pedestrians will extend along Tomasello Drive and Blue Line Road, providing connections between the Resort, surrounding neighborhoods, and the MBTA Suffolk Downs Station. At the southern edge of the site, a pedestrian path will provide direct access from the Orient Heights neighborhood to the Resort and Tomasello Drive, maintaining a key pedestrian link that has long been important to the community.

Streetscapes on the site are designed in compliance with the Boston and MassDOT Complete Streets standards, which puts pedestrians, bicyclists, and transit users on equal footing with motor-vehicle drivers. The initiative aims to improve the quality of life in Boston by creating streets that are both great public spaces and sustainable transportation networks.

A shared 16-foot-wide pedestrian and bicycle path will be constructed from the MBTA Suffolk Downs Station to the South Plaza at the casino entrance. The remaining approximately 5,800-foot-long 14-foot-wide shared path will be constructed from the entrance of Hotel I and extending eastward along Tomasello Drive to Winthrop Street (see Figure 1-41); a separate 14-foot-wide shared path will extend from Tomasello Drive to the Resort's employee entrance, where there will be secure, covered storage for approximately 60 bicycles. At the entrance to Casino Area II, valet bicycle service will be available in addition to a bicycle rack (see Figure 1-36, Bicycle Circulation).

In conjunction with the future deployment of the East Boston Hubway network, the Proponent is committed to installing two Hubway stations, one at Suffolk Downs Station and the second near the entrance to Casino Area II.

In addition to on-site bicycle amenities, the Proponent will provide on-street bicycle accommodations along the Bennington Street corridor from Saratoga Street in East Boston to Winthrop Street in Revere (see Section 5.8 for additional details).

1.5 Project Changes since Filing ENF

As a result of design advancements and ongoing coordination with agencies, host communities, surrounding communities, and interested parties, there have been several Project changes since the filing of the ENF. These changes are identified below, and are described in further detail in various sections of this document:

- The proposed site plan design now includes approximately 16 more acres of open space relative to existing conditions;
- The proposed site plan design will decrease impervious area by approximately 14 acres relative to existing conditions, compared with a decrease of only 9 acres in the ENF;
- The Project now includes an approximately 2.7 MW photovoltaic (PV) system, the building-mounted portion of which (approximately 1.45 MW) will represent one of the largest private building-mounted solar arrays in the northeast United States;
- The Project now includes several bicycle-related amenities:
    - The Proponent is committed to installing two Hubway bike stations in conjunction with the future deployment of the East Boston Hubway network: one will be at the Suffolk Downs MBTA Station, and one will be near the entrance to Casino Area II;
    - Covered bike storage with valet parking will be provided with a capacity for 160 bicycles (100 visitor bikes and 60 employee bikes) in accordance with Boston Transportation Department (BTD) guidelines;

- Short-term bicycle parking will be located at the entrance to Casino Area II;
- Employees will have access to six showers (3 women's, 3 men's) near the casino area as well as two showers in the jockey area;
- Covered bicycle parking will be provided at the employee entrance;

- The proposed pedestrian way leading from the intersection of Tomasello Drive and Route 1A into the main entrance of Project has been reconfigured to keep it separate from the roadway, moving it through the entry landscape to provide a more enjoyable pedestrian experience;
- A maintenance building is now included in the Project program;
- The size of Hotel II has increased to approximately 130,000 square feet;
- Valet parking has been added under Casino Area II;
- The overall square footage for the Project program has increased slightly, from approximately 1.8 million square feet to approximately 1.83 million square feet, resulting mainly from the addition of the maintenance building and an increase in the size of Hotel II;
- The "roof garden" that was first presented in the ENF has grown into an approximately 5,600-square-foot greenhouse that will provide fresh produce to restaurants at the Resort;
- Various sustainability elements such as rainwater harvesting and construction of a cogeneration facility are now part of the Project design as well as incorporating food composting in response to the Commonwealth's recent announcement (see Section 2.0); and
- Public bus shelters have been added to the proposed site plan.

1.6 Public Benefits

In addition to the design changes identified above, various public benefits have been added or enhanced since the ENF. Many of the various public benefits proposed as part of the Project are memorialized within the HCAs established with the cities of Boston and Revere (see Attachment B for copies of the Revere and Boston HCAs). The Proponent will also enter into agreements with its Surrounding Communities, as required by the Expanded Gaming Act, which will specify additional benefits to be provided. The Project will provide numerous significant public benefits, included but not limited to the following:

Capital Investments

- Subject to further discussions with the MBTA, approximately **$3.0 million in improvements are proposed for the Suffolk Downs MBTA Station**, including significant maintenance improvements, installation of new ADA-compliant elevators, new turnstiles, and site improvements such as new sidewalks, ramps, railings, lighting, wayfinding, landscaping, and a pedestrian shelter at the entrance to the Project site.

- **$33.4 million in Capital Improvements** to be used for East Boston Capital Commitments including park improvements at Lopresti Park (33 Summer Street in East Boston) and Noyes Playground (Boardman Street, East Boston), school improvements at the Mario Umana Middle School Academy (312 Border Street, East Boston), construction of a new combined youth and senior citizens center in the East Boston community, and creation of an East Boston Business Improvement District.

- **Water Transportation Contribution:** The Proponent supports Mayor Menino's vision to enhance water transportation options to East Boston by instituting regular water shuttle service between the South Boston and East Boston waterfronts. As such, the Boston HCA includes a contribution that will assist the City in establishing this service.

- **$42-50 million in Roadway Improvements:** Significant transportation improvements to the surrounding roadway network in East Boston and Revere that would improve existing conditions and accommodate the additional Project-generated trips, including: (1) Route 1A at Boardman Street, Waldemar Avenue, and Tomasello Drive – infrastructure improvements, widening, and signalization; (2) Bennington Street at Saratoga – intersection improvement, improve pedestrian condition; (3) Boardman Street at Saratoga Street – upgrade traffic circle; (4) Neptune Road – various improvements at multiple intersections; (5) Route 1A southbound at Curtis Street – create exit from 1A southbound; (6) Route 1 at Route 16 (Revere Beach Parkway) – intersection improvements; (7) Route 1 at Route 16 – commitment to fund planning and design for additional work; (8) Route 16, Route 145, Harris Street – widening and lane enhancements; (9) Site Bicycle Improvements – 14-foot bicycle and pedestrian pathway; and (10) Hubway Stations – two dedicated Hubway stations in conjunction with the future deployment of the East Boston Hubway network.

- **Strengthened MBTA Connection:** Improved access to the MBTA Suffolk Downs Station, including upgraded pedestrian, bicycle and shuttle connections to the Resort. The Proponent has also agreed to Suffolk Downs Station improvements:

- Maintenance improvements including concrete restoration and repair of the existing structure, ramps, stairs, overpass, and platform as well as repainting;
- Installation of two new ADA-compliant elevators, along with associated foundations, structure, and improvements;
- Three new turnstiles; and
- Various site improvements including new sidewalks, ramps, railings, lighting, way-finding, and landscaping, along with a pedestrian shelter located at the entrance to the Project site.

- **Boston Housing Authority:** Funding of up to $20 million over the term of the Boston HCA for the revitalization of Boston Housing Authority's Orient Heights housing development that abuts the Project site.

Economic Benefits

- **New Real Property and Personal Property Tax Revenue:** Enhanced annual property tax revenues.
- **Tax Revenues:** The Resort will generate significant new tax revenue at the state and local levels in the form of income tax, sales taxes, hotel taxes, food and beverage taxes, as well as taxes on gross gaming revenues.
- **Support for Local Businesses:** The Proponent expects to spend approximately $150 million annually for goods and services at local and regional businesses in connection with the ongoing operation of the Resort and also intends to partner with Boston, Revere, Chelsea, and Winthrop area hotels, restaurants, entertainment venues and tourism organizations to attract visitors and boost the local economy.
- **Support for Local Restaurants:** A "Streets of Boston" restaurant pavilion will bring six locally-owned restaurants to the resort.
- **Boston and Revere HCAs:** Payment to the cities of Boston and Revere of Community Impact Fees pursuant to the respective HCA for each city.
- **Publicity for Tourism Attractions:** The Resort will include interactive digital visitor display kiosks inside the resort casino that will promote attractions throughout Greater Boston.
- **Expansion of Caesars Total Rewards Program:** Caesars will seek to enlist several area hotels and restaurants in this program which allows its 45 million members in the United States and around the world to use rewards credits for meals and lodging, both inside and outside of the casino.

- **Partnership with Citi-Center:** The Performing Arts Center (including the Wang, Shubert, and Emerson Colonial theaters), a 77 year old non-profit, has partnered with the Proponent to collaborate on the entertainment and cultural activities at a future resort casino.

- **Additional Community Benefits:** In collaboration with the cities of Boston and Revere, the establishment of Community Advisory Boards to provide additional community benefits (e.g., inclusion of local vendors) relevant to Project impacts and to generally benefit the communities and their residents.

- **Mayor's Office of Arts, Tourism, and Special Events:** Funding to foster growth of cultural community, promote public participation in the arts and public celebrations, especially in East Boston, and advance cultural tourism in the City due to increased tourism and special events expected as a result of the Project.

- **Securing the future of Massachusetts' Racing Industry:** Construction of the Resort will secure the future of the Commonwealth's horse racing industry which directly and indirectly supports a significant number of jobs in the state.

- **Ground Shuttle Connection Program**. In an effort to tie the Project to the communities in which it is located, the Proponent will operate a 24 hour shuttle service connecting the Resort to East Boston and Revere business districts, other nearby tourist and cultural attractions, area hotels, and regional transportation hubs. It will operate as a connector with the planned water shuttle to the Maverick Square area once that service is running.

Extensive Employment Benefits

- **New Jobs:** Approximately 2,500 construction jobs and approximately 4,000 permanent resort jobs, the latter of which will encompass more than 39 job categories such as hotel/resort personnel, facility employees, food and beverage, gaming, racing, and management and operation and will include full job training, benefits and opportunities for career advancement.

- The Proponent will host and maintain a **central job bank website** (in English and Spanish) as a micro-site within the larger Project website.

- The Proponent will utilize best efforts to use the **existing labor force** in the Commonwealth, and in particular the existing labor force in the host communities, when hiring for new construction jobs, as required by Section 18(17) of the Expanded Gaming Act.

- The Proponent will hold **job fairs** at the Project site to make host community residents aware of job opportunities.

- The Proponent will establish, fund and maintain **human resource hiring and training practices** that promote the development of a skilled and diverse workforce and access to promotion opportunities through a workforce training program that: (i) establishes transparent career paths with measurable criteria within the gaming establishment that lead to increased responsibility and higher pay grades that are designed to allow employees to pursue career advancement and promotion; (ii) provides employee access to additional resources, such as tuition reimbursement or stipend policies, to enable employees to acquire the education or job training needed to advance career paths based on increased responsibility and pay grades; and (iii) establishes a program or partnership to provide off-site child day-care, all as required by Section 18(9) of the Expanded Gaming Act.

- The Proponent will provide host community residents with **advance notice of hiring activities** by publishing announcements in local newspapers approximately four to eight consecutive weeks prior to initial hirings.

- Host and surrounding community residents will be given **first priority to apply for jobs** during a specified "advance period," and written flyers in English and Spanish will be distributed to publicize this period.

- The Proponent will donate at least 25 **computers** to be placed in strategic areas in East Boston (e.g., libraries or community centers) as well as install and maintain at least two computers on-site to ensure that residents without computers can research and apply for jobs at the Project site online.

- The Proponent will use best efforts to work with the Public Schools Department to establish **school-to-work programs** for hospitality jobs at vocational or public high schools in the host communities.

- The Proponent will support the efforts of and actively engage with the Massachusetts Gaming Commission and community colleges to develop the **Massachusetts Community College Workforce Training Institute and Massachusetts Casino Careers Training Institute** at community colleges in the Commonwealth, particularly those within the City of Boston.

- The Proponent will provide opportunities for team members to pursue **personal and professional growth**, to enjoy satisfying **careers**, to participate in **training** and development programs and to celebrate success including rewards and recognition for superior performance against measurable goals.

- The Proponent will provide new employees with **learning programs** such as the "Empire Series," Caesars' best-in-class and award-winning learning program for all new employees. This program offers a lively and engaging environment that uses cutting-edge technology. In addition to such a learning program, the Proponent will provide **specialized training courses** customized to meet employee learning needs.

- The Proponent will provide an **educational assistance program** that reimburses employees 90% of tuition costs up to a maximum of $3,000 per year for pre-approved undergraduate classes or up to a maximum of $4,000 per year for pre-approved graduate study at an accredited college or university.

- The Proponent will provide **regulatory and compliance training** such as Skillsoft, which is Caesars' online learning platform, used to deliver all regulatory and compliance training in addition to numerous **professional development courses**.

Green Design and Environmental Benefits

- **Sustainable Design/Green Building:** The Proponent will set a new standard of excellence in sustainable design for gaming development projects. With a commitment to achieve LEED NC v2009 Gold Certification, the Resort will be sustainably designed, energy efficient, environmentally conscious, and healthy for its employees and visitors. Innovative technologies are currently being explored to determine what works best with the Project as well as what might set a visible example for those visiting the site.

- **Open Space:** The Project will increase open space by approximately 16 acres over existing conditions, and will increase pervious surfaces by at least 14 acres.

- **Water Quality Improvements:** Improved stormwater management on the Project site, which will lead to enhanced water quality reaching Sales Creek, the Belle Isle Inlet, and Rumney Marshes ACEC.

- **New Bicycle and Pedestrian Connections:** To enhance local and regional connectivity, the Project will improve bike and pedestrian circulation and access. The Project includes provision of on-street bicycle accommodations to connect Constitution Beach, Belle Isle Marsh, and Revere Beach along the Bennington Street corridor, along with connections to and through the Project site from the Suffolk Downs MBTA station and from Winthrop Avenue. On-site pedestrian paths and aesthetically-pleasing open spaces will encourage pedestrian activity and access, including at the site entries. The pedestrian connection from Orient Heights will be maintained.

- **Bicycle Amenities:** The Project includes valet bicycle parking, two future Hubway stations, showers for employees, covered bicycle storage, and short-term bicycle parking.

- **Agricultural Support:** The Project, unlike conventional mixed-use development alternatives which would typically involve higher-density build-out, will maintain open space and support continued agricultural and open space practices in Massachusetts.

In addition to the specific Project benefits listed above, the Proponent has committed as part of a consent decree with the U.S. Environmental Protection Agency (EPA) to fund over the next four years three important regional supplemental environmental projects valued at approximately $742,000. This includes construction of a boardwalk that will improve public access through Belle Isle Marsh and protect natural resources within the Marsh from degradation through pedestrian contact.

1.7 Public Participation

The Proponent has engaged in extensive public outreach by holding a series of meetings with specific interest groups and the public at large. Community meetings have been held in East Boston, Revere, Chelsea, and Winthrop and the Proponent has met with staff and elected officials in these communities as well. Below is a partial list of community groups the Proponent has met with as well as community meetings that have been held thus far:

Community Groups

- Greater Boston Visitors and Convention Bureau;
- Greater Boston Labor Council;
- East Boston Chamber of Commerce;
- East Boston Latino business leaders;
- Revere Chamber of Commerce;
- Revere Patriot Club;
- Orient Heights Neighborhood Association;
- Orient Heights Yacht Club;
- Kiwanis;
- Chelsea Casino Forum – Chelsea Chamber of Commerce;
- Chelsea Chamber of Commerce;
- Chelsea Chamber of Commerce – Latino Division;
- International Brotherhood of Electrical Workers;

- Union members in East Boston and Revere;
- Eagle Hill Civic Association;
- Winthrop Chamber of Commerce;
- Greater Lynn Area Chamber of Commerce;
- North Shore Alliance for Economic Development;
- Beachmont Improvement Committee;
- Air Cargo Club of New England;
- The Boston Harbor Association;
- Spanish-speaking employees of Suffolk Downs;
- Salem Rotary Club;
- Charlestown Waterfront Coalition;
- Friends of the Belle Isle Marsh;
- Maverick Landing Association of Residents;
- Suffolk University Casino Forum;
- St. George Apartments; and
- Barnes School Apartments.

Community Meetings

- East Boston (June 12, 2012);
- Revere (June 13, 2012);
- Winthrop (June 26, 2012, November 15, 2012;
- Chelsea (July 12, 2012);
- Revere (transportation focused) (August 21, 2012);
- Beverly Rotary Club;
- Revere Economic Development Summit (October 26, 2012);
- East Boston (transportation focused) (August 23, 2012);
- Latino Community (East Boston) (March 5, 2013);
- Public Transportation Presentation for Spanish Speakers (March 27, 2013); and
- Waldemar Avenue Neighbors Meeting (April 2, 2013);
- East Boston Model Viewing (April 9, 2013);
- Revere Model Viewing (April 11, 2013);

- General Public Model Viewing (April 13, 2013);
- Beachmont Improvement Committee Model Viewing (May 13, 2013);
- East Boston and Revere Open House Model Viewing (May 13, 2013);
- Local Union Member Model Viewing (May 22, 2013);
- East Boston YMCA Model Viewing (May 28, 2013);
- Orient Heights Yacht Club Model Viewing (May 29, 2013);
- East Boston Social Center Model Viewing (May 30, 2013);
- Vendor Forum Open House (June 5, 2013);
- Victory Gardens Apartments Presentation (June 11, 2013); and
- Urban League of Eastern Massachusetts Casino Forum (June 17, 2013).

1.8 Development Context

The list below identifies each of the development projects in the study area of the proposed Caesars Resort at Suffolk Downs that have been included as background to help assess the cumulative impacts from the Project. As such, these various projects are included in the No Build transportation analysis in one of the following ways: (1) estimated traffic impacts from available studies or environmental documents; (2) performance of trip generation analyses, trip distribution and assignment; (3) already included in background regional traffic growth; (4) already included in existing traffic counts; or (5) too small or remote from the Project study area to have any meaningful effect.

Revere Projects:

- Market Basket, consisting of approximately 83,000 square feet of retail;
- Verizon, an approximately 4,000-square foot retail store;
- Tedeschi Food Mart, approximately 4,700 square feet;
- Wonderland Market Place, consisting of approximately 62,000 square feet of retail;
- Harley Davison, a 40,000-square-foot specialty retail store;
- A Mobil gas station with approximately 10 pumps and 4,500 square feet of retail;
- A Prime gas station with approximately 10 pumps and 2,200 square feet of retail;
- Ward Street Residential, consisting of approximately 261 units;
- 526-646 Revere Beach Boulevard, an approximately 145-unit residential development;

- 525 Beach Street, an approximately 35-unit residential development;
- Thayer Avenue, an approximately 45-unit residential development;
- 55 Revere Beach Boulevard, consisting of approximately 55 residential units;
- Waterfront Square (Parcel I), consisting of approximately 194 residential units;
- Waterfront Square (North Lot), consisting of approximately 500 residential units;
- Wonderland Greyhound Track, a mixed-use development;
- Waterfront Square (Parcel H), a project involving approximately 400 hotel rooms, 149 residential units, and 50,000 square feet of retail;
- 197 Broadway, consisting of approximately 40 residential units and 4,000 square feet of retail;
- Wonderland Ballroom site, consisting of approximately 200 hotel rooms;
- Shaw's site, which is in the planning stage for an approximately 300-room hotel;
- For Kids, an academic facility for approximately 120 students;
- An elementary school for approximately 690 students; and
- Della Russo stadium, which will seat approximately 2,000.

East Boston Projects:

- Clippership Wharf, consisting of approximately 400 residential units;
- Portside at Pier 1, consisting of approximately 178 residential units;
- Boston East, with approximately 191 residential units;
- Hodge Boiler Works, consisting of approximately 95 residential units;
- New Street Development, with approximately 224 residential units and a 235,000-square-foot hotel;
- 415 McClellan Highway, an approximately 117,060-square-foot hotel and retail project; and
- An approximately 42,800-square-foot Charter School.

1.9 Project Alternatives

As required by the Secretary's Certificate on the ENF, this section discusses the preferred alternative (i.e., the proposed Project), a No-Build alternative, and two other development alternatives. The first development alternative is an approximately 3.8 million-square-foot mixed-use development. The second development alternative is an approximately 2.8 million-square-foot primarily retail-based development containing residential as well as office uses. Table 1-3 defines the programs of the two development alternatives.

Table 1-3 Comparison of two development alternatives for the Project site.

	Alternative 1 ("Office")	*Alternative 2 ("Retail")*
Retail, square feet (sf)	1,286,500	1,642,000
Office, sf	1,496,000	147,000
Residential, sf	1,001,500 (1,030 units)	940,200 (900 units)
Total square footage	*3,784,000*	*2,737,200*
Parking (including garages)	11,978 spaces	8,077 spaces

Table 1-4 compares potential impacts associated with the No-Build alternative, preferred alternative, and two development alternatives. Each alternative is also discussed in greater detail below. After evaluating the environmental impacts, costs, and benefits of the various alternatives, the Proponent identified the proposed Project as the preferred alternative.

Table 1-4 Impact Comparison of Various Alternatives Considered

	No-Build	*Preferred*	*Office Alternative*	*Retail Alternative*
New Land Alteration (acres)	0	0	0	0
Impervious Area (acres)	70.34	53.74	98.56	85.24
Open Space (acres)	80.75	99.26	28*	34.7*
Water Use (gpd)	40,200	354,017	381,123	265,788
Wastewater Generation (gpd)	166,020	321,834	346,475	241,625
Wetlands (sf of alteration)	0	0	0	0
Traffic Generation (net new average daily vehicle trips)	0	21,434 (weekday) 33,038 (Sat.)	34,128 (weekday) 36,294 (Sat.)	33,360 (weekday) 40,740 (Sat.)
Parking Spaces	6,000	5,100	11,978	8,077

* Open space calculations for the two development alternatives assume that 50% of the areas not paved, buildings, or wetlands are open space.

1.9.1 Preferred Alternative

The preferred alternative is described in detail in Sections 1.1 and 1.2. The Expanded Gaming Act sets certain minimum criteria that the preferred alternative has been designed and planned to meet. For example, Sections 9 and 15 of chapter 23K set certain minimum requirements that applicants must meet in order to apply for a gaming license in the

Commonwealth. M.G.L. c.23K, §15(2) requires applicants to "invest not less than the required capital under this chapter into the gaming establishment," which minimum capital investment for a Category 1 facility is $500,000,000 pursuant to G.L. c.23K, §10(a). The Proponent will therefore be required to meet this level of capital investment through construction of the Project, infrastructure, off-site improvements, and other public benefits.

In addition to these minimum requirements, the Expanded Gaming Act includes a number of factors that the Massachusetts Gaming Commission is required to consider in evaluating each application for a gaming license. These include, for example, how the applicant proposes to maximize revenues to the Commonwealth, how the applicant realizes maximum capital investment exclusive of land acquisition and infrastructure improvements, the caliber of the gaming establishment and whether it has a variety of quality amenities, and whether the Project will utilize sustainable building development principles. The application and evaluation criteria set forth in the Expanded Gaming Act have guided the Proponent in its design of the Project. The list below identifies some of the ways in which the Project has been designed to meet and exceed these various criteria. For a complete list of the factors the Commission must consider in evaluating a license application, please consult G.L. c.23K, §§15 and 18 and 205 CMR 119.00.

- The Proponent will invest not less than $500,000,000 in the Project. See G.L. c.23K, §10(a) and §15(2).

- The Project has been designed to be the greenest casino in the country and to set the standard in sustainable design for gaming development projects around the world with an emphasis on energy efficiency, alternative modes of transportation, water conservation, and stormwater management. See G.L. c.23K, §18(8).

- The Proponent expects to achieve a LEED Gold certification for the Project. See G.L. c.23K, §18(8)(i).

- The Project has been designed not only to meet or exceed requirements of the existing stretch code, but to meet or exceed the anticipated requirements of the new stretch code that is anticipated to be proposed sometime in 2013. See G.L. c.23K, §18(8)(ii).

- The Proponent is committed to a rigorous TDM program designed to mitigate vehicle trips and encourage alternative modes of transportation among employees and guests. See G.L. c.23K, §18(8)(iii).

- At least 10% of the annual electricity consumption for the Resort will be generated on-site using a renewable energy source (solar power), and the Proponent will also purchase Renewable Energy Certificates to provide a minimum of 35% of the buildings' electricity from renewable sources as described in further detail in Section 2.0. See G.L. c.23K, §18(8)(vi).

- The transportation improvements proposed in connection with the Project are designed to both address existing long-term regional traffic and transportation issues and to mitigate the potential impacts on host and surrounding communities of the Project. See G.L. c.23K, §18(14).

1.9.2 Development Alternative 1 – Mixed Use/Office

Alternative 1 consists of developing the site into approximately 3.8 million square feet of retail, office, and residential space located in 15 new buildings (see Figure 1-42). The Alternative 1 buildings range in height from 1 to 17 stories, and the taller buildings (a 17-story and two 10-story buildings) are residential towers containing 1,030 residential units (approximately 50% one-bedroom and 50% two-bedroom units). The three residential towers, at just over one million square feet, encompass approximately one-third of the Alternative 1 development program. The remaining buildings consist of a mix of retail and office uses, with retail primarily on the first floors and office spaces on the floors above. Three parking garages would be required near the residential towers, and in total Alternative 1 would require approximately 12,000 parking spaces in both surface and garage parking. No wetlands would be altered, although site work would occur on the vast majority of the site.

Alternative 1 would have a potable water demand of approximately 381,000 gallons per day (gpd), and would generate approximately 346,000 gpd in wastewater flows.

Alternative 1 would contain drastically less open space than the preferred alternative (i.e., the proposed Project), and would significantly increase impervious surface area relative to existing conditions.

Alternative 1 would also generate significantly more traffic than the preferred alternative, with approximately 34,128 new average daily weekday trips and approximately 36,294 new average daily Saturday trips. Moreover, the nature of the trips would be such that, unlike the preferred alternative, many of them would conflict with peak traffic periods, thereby further exacerbating traffic conditions.

Alternative 1 would be subject to state and local permitting review and would be subject to the zoning of Boston and Revere, and would not typically be proposed to include the substantial economic benefits or comprehensive infrastructure improvements associated with the proposed Project which are memorialized in the HCAs with the cities of Boston and Revere.

1.9.3 Development Alternative 2 – Primarily Retail

Alternative 2 consists of a developing the site into approximately 2.8 million square feet of mixed uses but with a particular emphasis on retail space (see Figure 1-43). This alternative includes 16 buildings and contemplates the development of two "big box" retail stores along with four buildings containing residential uses. A total of 900 residential units (50%

one-bedroom and 50% two-bedroom units) occupying just under one million square feet are included in Alternative 2. A modest amount of office development (approximately 147,000 square feet) would be provided in four buildings. With retail uses occupying the remaining Alternative 2 buildings, the total retail area would exceed 1.6 million square feet. Alternative 2 would also include the construction of three parking garages, and total parking on-site would be approximately 8,077 spaces including surface parking and garage parking.

Alternative 2 would demand almost 266,000 gpd in potable water use and would generate approximately 242,000 gpd in wastewater flows, both less than the preferred alternative. However, Alternative 2 would generate approximately 33,360 new average daily weekday trips and approximately 40,740 new average daily Saturday trips, significantly more than the preferred alternative. Moreover, the nature of the trips would be such that, unlike the preferred alternative, many of them would conflict with peak traffic periods, thereby further exacerbating traffic conditions. Due to the fact Alternative 2 consists of one- and two-story retail buildings, the density would be lower than the density of Alternative 1; however, site disturbance would still cover much of the site, and impervious area would still increase over existing conditions. Open space, while more than for Alternative 1, would remain far below the preferred alternative.

Alternative 2 would be subject to state and local permitting review and would be subject to the zoning of Boston and Revere, and would not typically include the substantial economic benefits or comprehensive infrastructure improvements associated with the proposed Project which are memorialized in the HCAs with the cities of Boston and Revere.

1.9.4 No Build Alternative

The No Build alternative would not include the substantial economic benefits or comprehensive infrastructure improvements associated with the proposed Project which are memorialized in the HCAs with the cities of Boston and Revere.

The Project site would remain underutilized and, given the overall decline in the stand alone racing industry, would likely suffer the loss of the horse racing component, the retention of which has been a stated goal of the Massachusetts Gaming Commission. Since Suffolk Downs is New England's last remaining thoroughbred racing venue, the loss of horse racing would have a significant impact on the Massachusetts economy. Horse racing provides an array of jobs, both on and off the track, from minimum wage through more highly paid technical and management positions. During the racing season at Suffolk Downs there are approximately 900 workers on-site. The track and its major vendors (security, concessions, janitorial, video production, wagering service provider) employ 300 workers, while there are an additional 600 workers who make their living working with the horses (e.g., trainers, assistant trainers, jockeys, exercise riders).

The racing industry in turn fosters many other industries, all needed to support and sustain a healthy horse racing structure. Veterinarians and blacksmiths, local feed and supply enterprises, and tack shops that make and provide saddles, harnesses, and other related equine equipment are needed to ensure the health and longevity of these four-footed athletes. For example, the leading hay supplier for Suffolk Downs provides 458 tons of hay (approximately 18,000 bales) throughout the racing season. There are approximately 36 tack stores throughout Massachusetts offering equine feed products and supplies.

According to the Massachusetts Thoroughbred Breeders Association, there are more than 20 Thoroughbred breeding farms in the Commonwealth. A continued presence of racing in Massachusetts is expected to increase the number of mares brought to Massachusetts to foal. There would be little, if any, market for these farms if horse racing becomes defunct in Massachusetts.

In addition, the links between horse racing and Massachusetts open space and the agricultural industry must not be discounted. Many acres of agricultural land are currently needed to care for, train, and groom racehorses, which in turn lead to additional jobs. According to the most recent agricultural census conducted by the United States Department of Agriculture, there are nearly 7,700 farms in Massachusetts providing more than 16,000 acres of open land. While the majority of these are active in crop production, the 24 horse breeding farms comprise more than 5,000 acres of open space. These could potentially be lost to development without an active horse racing industry in Massachusetts.

1.10 Socioeconomics and Environmental Justice

Environmental Justice (EJ) is based on the principle that all people have a right to be protected from environmental pollution and to live in and enjoy a clean and healthful environment. This requires equal protection and meaningful involvement of the community with regard to the development and enforcement of environmental laws and regulations to ensure that lower income communities and communities of color do not share a disproportionate share of the environmental burdens associated with growth and development.

In 2002, the EEA adopted an Environmental Justice Policy to ensure that EJ Populations are engaged in environmental decision-making through expanded and inclusive outreach, with the goal of improving the environmental quality of life in those, and all, communities.

EEA's Policy defines EJ Populations as neighborhoods that meet one or more of the following criteria:

- Median annual household income is at or below 65% of the statewide median income;
- 25% or more of the residents are minorities;

- 25% or more of the residents are foreign born; or
- 25% or more of the residents lack English language proficiency.

Both host communities qualify as EJ Populations. According to 2010 U.S. Census Block data (in information provided by EEA), 109 of the communities in Massachusetts have an EJ Population.[1] According to that same data, the host community of Revere is an EJ Population community, meeting each of the EJ criteria defined in the EEA policy. Additional demographic information that looks at Boston neighborhoods confirms that East Boston also meets at least one of the criteria to be considered an EJ Population.[2] The nearby communities of Chelsea and Winthrop also meet one or more of the required criteria.

1.10.1 Requirements of the EEA Environmental Justice Policy

In adopting its EJ Policy, EEA directed state agencies to take EJ Populations into account in their policies, regulations, and financial decision-making. Agencies were also directed to work with EJ Populations to take direct action to restore degraded resources, increase access to open space and parks, and address environmental and health risks associated with existing and potential new sources of pollution by:

- Enhancing opportunities for residents to participate in environmental decision-making;
- Enhancing environmental review of new or expanding large sources of air emissions and regional waste facilities in those neighborhoods;
- Ensuring that all existing facilities in these neighborhoods comply with all environmental rules and regulations; and
- Encouraging investment in economic growth in these neighborhoods where there is existing infrastructure.

---

1 MA Executive Office of Energy and Environmental Affairs, 2010 Environmental Justice Populations

2 According to 2010 Census Data, the total population of East Boston was 40,508. Of that population, 35.2% was identified as non-white and 52.9% was identified as Hispanic or Latino. The 2010 median household income in Massachusetts was $63,967 [US Census Bureau 2010 and 2011 American Community Surveys]. Sixty-five percent (65%) of that 2010 median is approximately $41,579. The median household income for East Boston is $42,747 (American Community Survey, BRA Research Division Analysis). Some sources have reported median household income for East Boston to be as low as $40,960.

Projects that require MEPA review and are in close proximity to EJ Populations are given very specific mandates in the EJ Policy with regard to residents of those neighborhoods who were historically unaware of or unable to participate in environmental decision-making. Such projects require enhanced public participation as well as enhanced analysis of impacts and mitigation.

Enhanced public participation may include using alternative media outlets such as community or ethnic newspapers, use of alternative information repositories, and translation of materials or interpretation services at public meetings. Enhanced analysis of impacts and mitigation may include analysis of multiple air impacts, data on baseline public health conditions within affected EJ Population(s), analysis of technological, site planning, and operational alternatives to reduce impacts, and proposed on-site and off-site mitigation measures to reduce multiple impacts and increase environmental benefits for the affected EJ Population(s).

1.10.2 Actions to Address EJ Populations

The Proponent has paid close attention to the potential Project impacts on EJ Populations that surround the Project site. The Proponent has acted in both the spirit and letter of the EEA EJ Policy to ensure that EJ Populations of Revere and East Boston have had and continue to have the opportunity for inclusive, robust participation. This is consistent with Caesars' corporate "Code of Commitment," which reflects a steadfast commitment to integrity and communication with the communities in which its facilities are located and environmental stewardship. This Code of Commitment can be found at http://www.caesars.com/corporate/about-us-code-of-commitment.html.

In connection with the operation of the Suffolk Downs racetrack, the Proponent has been an integral part of the community for many years. Unlike many developers who come to a site having no direct history or involvement with an area or its residents, Suffolk Downs knows and has been a part of the fabric of the area for over 75 years. As such, it has witnessed changes in surrounding populations and has adapted to those changes. The approach to educating and informing residents about the proposed Project is consistent with the intent behind EEA's EJ Policy. In keeping with this commitment, Suffolk Downs has maintained active memberships with the following local Chambers of Commerce: East Boston, Revere, Chelsea, Winthrop, North Shore, Greater Boston, Hispanic American Chamber of Commerce as well as the Greater Boston Convention and Visitors Bureau. Over the last year, Project update presentations have been given to each one of these groups in an open forum.

Suffolk Down's local employment record demonstrates its deep commitment to community, with many of the permanent, year-round employees residing in East Boston and Revere. The Proponent has employed traditional outreach and notification efforts to ensure that Revere, East Boston, Chelsea, Winthrop, and other nearby communities have been regularly and thoroughly informed about progress on the Project design. In keeping with its

commitment to ensure that information about the Project is meaningful to all those who may be impacted, the Proponent has also been aggressive in its use of alternative media to reach out to the Spanish-speaking populations of Revere and East Boston.

Since February 2013, the Proponent has convened public meetings with the Latino Division of the Chelsea Chamber of Commerce, East Boston Latino business leaders, and Spanish-speaking employees of Suffolk Downs, in addition to holding a Latino Community Public Meeting and hosting a public transportation presentation for Spanish-speakers. Public meetings have included interpreters. Public notices announcing these meetings appeared in traditional print media as well as in the following community and ethnic newspapers: East Boston Times, Revere Journal, Revere Advocate, El Mundo, El Planeta, La Semana, Siglo 21. All materials disseminated at public meetings are available in English and in Spanish at www.friendsofsuffolkdowns.com.

Recognizing that it is important for meetings to be held at convenient times for interested residents, the Proponent has scheduled meetings for various times during the day. Eleven meetings have been held between 9 am and 5 pm; 27 meetings have been held in the evenings after 5:30 pm and one meeting was held on a Saturday between 11:00 am-1:00 pm.

The Project website (www.suffolkdowns.com) and www.friendsofsuffolkdowns.com are available in both English and Spanish, providing information on Project progress and ongoing activities at the Suffolk Downs racetrack. The website includes facts about the proposed Project and information about potential jobs as well as vendor and supplier opportunities.

As with the ENF, copies of this DEIR/EPNF have been provided to the East Boston branch of the Boston Public Library, the Revere Public Library as well as the Boston Public Library to increase opportunities for public review and comment.

1.10.3 Enhanced Analysis of Impacts and Mitigation

EEA's EJ Policy requires enhanced EIR analysis of impacts and mitigation for a project undergoing MEPA review if that proposed project meets two criteria:

- the project exceeds a mandatory EIR threshold for air, solid and hazardous waste, or wastewater and sewage sludge treatment disposal; and
- the project is located within one mile of an EJ Population (or five miles if the project exceeds a mandatory EIR threshold for air).

The proposed Project meets the criteria for such enhanced analysis of impacts and mitigation under MEPA. First, the Project exceeds the following mandatory thresholds for an EIR:

- 301 CMR 11.03(1)(a)(1): direct alteration of 50 or more acres of land, unless the Project is consistent with an approved conservation farm plan or forest cutting plan or other similar generally accepted agricultural or forestry practices; and

- 301 CMR 11:03(6)(a)(6): Generation of 3,000 or more new adt on roadways providing access to a single location.

Second, the Project is located within one mile of two EJ Populations, East Boston and Revere, and is within five miles of two additional EJ Populations, Chelsea and Winthrop.

Section 1.6 describes the Project's numerous public benefits, and mitigation measures intended to avoid and minimize potential Project-related impacts are summarized in Section 10.0 and described in greater detail throughout this DEIR/EPNF.

1.10.4 Other Actions and Approaches to Enhance the Participation of EJ Populations

As described above, the Proponent has worked diligently not only to meet EEA EJ Policy but also to ensure that the quality of life for the Resort's neighbors is enhanced through the proposed development. Some examples of these efforts to support residents of Revere and East Boston and to ensure they enjoy a clean and healthful environment are identified below; many of these efforts are also described in other parts of the DEIR/EPNF:

1. Promoting Economic Partnerships: Commitment to hiring Revere and East Boston residents

The Resort will bring approximately 4,000 permanent jobs and approximately 2,500 construction jobs to the area, and the Proponent recognizes that hiring local residents will be a priority. The Proponent proposes a local hiring program that will include the following components:

- Host and maintain for a given period a central job bank website as a micro-site within the larger Project website;

- The Proponent will provide residents of Revere and East Boston with advance notice of hiring activities by publishing announcements prior to initial hirings;

- Residents of the host communities will be given priority to apply for jobs during a specified "advance" period;

- Written flyers in English and Spanish will be distributed to local community-based organizations to inform people about local advance hiring;

- The Proponent will partner with local community college and community centers to provide an open computer lab for applicants who may not have a computer or internet access to submit an online application; and

- The Proponent will develop a job training program in accordance with Section 3, questions 8 and 9 of the Massachusetts Gaming Commission's proposed Request for Application (RFA) 2 application.

2. Promoting Economic Partnerships: Providing economic opportunities for local vendors and suppliers

The Proponent expects to spend $150 million annually on local and regional goods and services, and is committed to procuring local and regional goods from a diversified pool of vendors, contractors, and profession service providers. The Proponent will operate a shuttle to run regular service between the Project site and nearby business areas, and will work closely to cultivate local vendors, including certified minority-owned, women-owned, disabled, and disadvantaged business enterprises.

3. Promotion of Green Space: Grounds around the Resort

As described in Section 4.0, the Proponent has taken great efforts in landscape design to ensure that the Resort grounds will be welcoming to neighbors and that pedestrian and bicycle pathways will promote accessibility to and through the site. Landscaping and open spaces are being designed to encourage use by the neighbors.

4. Promotion of Green Space: Improvements to and around Revere Beach

To enhance local and regional connectivity, the Project will improve bike and pedestrian circulation and access. The Project includes provision of on-street bicycle accommodations to connect Constitution Beach, Belle Isle March and Revere Beach along the Bennington Street corridor, along with connections to the Project site from the Suffolk Downs MBTA station and from Winthrop Avenue. On-site pedestrian paths and aesthetically-pleasing open spaces will encourage pedestrian activity and access, including at the site entry.

5. Transportation

The Project will provide substantial investment in local and regional transportation infrastructure, and will enhance multi-modal access to the Project site and within the neighborhoods.

6. Alternatives

Section 1.9 contains an alternatives analysis that includes two alternative development scenarios for the Project site. Both alternatives have been designed to be reasonable and feasible, with one being a mixed-use development and one being primarily retail-based. Given the proximity of the site to public transportation, it is expected that any alternative development scenario would involve significant density and the elimination of the view

corridor and open space that will be preserved by the continued operation of the racetrack. As demonstrated in the alternatives analysis, these alternative development scenarios would have more significant impacts and fewer public benefits than the proposed Project.

1.11 Project Schedule and Phasing

This section describes the Project's construction schedule, planned stages of construction, and schedule for delivery of public benefits.

1.11.1 Phasing Plan

The Project will be constructed in one continuous phase, although certain portions of the Resort will open to the public before others are completed. Staging is described in greater detail in the Draft Construction Management Plan (CMP) in Attachment L, and plans are provided illustrating the anticipated progress of construction throughout the Project site and showing how site access will be provided throughout construction. Casino Area I and the clubhouse will be completed and are planned to open to the public during months 14 to 17, as will patron parking areas and the major on-site roadway infrastructure. The parking garage will be complete and in operation during months 17 to 20, and reconstruction of Tomasello Drive, including landscaping, will also be complete during this period. Casino Area II and Hotel I will be completed by month 26 of construction, when the Resort will be fully turned over for public use. The proposed widening of Route 1A will be completed prior to the opening of any element of the Resort and the remaining proposed improvements to Route 1A will be completed prior to the opening of Casino Area II and Hotel I. As described in Section 1.1.1.7, other off-site infrastructure improvements proposed as part of the HCAs and surrounding community agreements will be completed in accordance with the terms of those agreements (see also Section 5.6 for a discussion of phasing off-site improvements).

1.11.2 Construction Schedule

Project construction is expected to take approximately 26 months, with construction beginning in spring 2014 (assuming issuance of a gaming license) and continuing through spring of 2016. Typical construction hours will be from 6:00 a.m. to 7:00 p.m., Monday through Saturday. Weekend and/or 2nd/3rd shift activities will be performed in a manner that will minimize impacts as may be necessary to meet permitting restrictions. The construction manager will also need to perform some activities, such as materials unloading, during off hours; deliveries of large construction equipment (e.g., cranes, excavation equipment) will be scheduled to avoid and/or minimize impacts to vehicular and pedestrian traffic.

No truck idling, construction activity, or staging outside of the construction site fencing on the Project site will be allowed between the hours of 7:00 p.m. and 6:00 a.m. It is expected that material staging and hoisting will be undertaken within the fenced enclosure during 2nd/3rd shifts. Off-site improvements will be constructed at a time and using

techniques designed to minimize nearby noise and impacts on traffic. Every two weeks, the contractor will publish an updated schedule of upcoming work and will disseminate the schedule to affected parties in local neighborhoods. In addition, the construction manager will publish monthly schedule updates describing progress as well as projected activity for the next month. This information will be available on a Project website which will allow neighbors real-time access to the most up-to-date construction information. Construction-period activities are discussed in greater detail in the Draft CMP in Attachment L.

Section 2.0

Commitment to Green

2.0 COMMITMENT TO GREEN

This section describes the Proponent's commitment to creating the greenest, most sustainable casino development in the United States. The Project's various sustainable design elements are described below along with discussions of LEED credits and climate change adaptation.

Caesars Entertainment is committed to developing projects that are sustainably designed, energy-efficient, environmentally conscious, and healthy for employees and visitors. At all of its casino resorts, Caesars Entertainment implements an Environmental-Social-Governance sustainability strategy. This strategy, CodeGreen, addresses critical issues of energy, waste, water, and carbon emissions and seeks to engage Caesars employees in efforts to reduce natural resource use, conserve energy, and promote reuse and recycling. In the past nine years, Caesars has invested nearly $70 million on energy conservation projects alone and has invested in more than 162 retrofits involving, among others items, energy-efficient lighting, improved air-handling systems, upgraded thermostats, advanced energy-saving sensors, and low-flow water controls and fixtures. Annual savings from these retrofits include in excess of 208 million kilowatt-hours in energy, over 3.3 million therms in natural gas, more than $24 million in annual resources, and 298 million pounds of carbon dioxide emissions.

Two of the challenges in sustainable design for this Project are the high-demand energy use inherent in the round-the-clock operations of casinos and the Project site context. The Project team carefully considered the site location, adjacency to wetlands, and native plant life when designing the Project. In an effort to build upon Caesars Entertainment's knowledge of and commitment to sustainability, the design team gathered energy use data from existing Caesars casino properties and identified several energy efficiency measures that were subsequently tested in various iterations of the building energy model. Measures that demonstrated the most significant energy savings were incorporated into the building systems design.

The Proponent engaged the Project design team early in the design phase by tasking a sub-group of the team, nicknamed the "Green Team", to focus on sustainable design and energy efficiency approaches. Using an integrative approach, the Green Team was able to incorporate several sustainable design measures into the Project. This group is comprised of architects, mechanical, electrical, and plumbing (MEP) engineers, civil engineers, landscape architects, sustainable design consultants, the Owner's project manager, and representative members of the Owner's project management team; this team meets bi-weekly and has held numerous meetings to date. The Green Team reviews research and discusses the viability of implementing potential sustainable design elements and energy efficiency building systems components into the Project design.

Throughout the design phases, the Green Team has researched and collectively reviewed a myriad of sustainable design approaches and related technologies, including but not limited to:

- extensive planting of native and adaptive plant species and natural landscaping design to improve the on-site absorption of rainwater and reduce runoff;

- rainwater harvesting for irrigation uses;
- installation of a geothermal system;
- construction of a cogeneration facility;
- use of sustainable technologies and strategies in the design and construction of off-site transportation improvements, in a manner consistent with MassDOT's GreenDOT policy initiative;
- sourcing an anaerobic digester plant to accept bio-waste generated on site; and
- installation of a PV array for on-site renewable power generation.

Several of the potential sustainable design solutions are now integrated into the Project's proposed design, and are discussed in further detail below, while others were considered but rejected as infeasible for this particular Project.

The Proponent also performed detailed research into the feasibility of using water transportation in its suite of strategies for bringing visitors to the Resort. A Water Transportation White Paper is provided as Attachment C. This analysis demonstrates some significant challenges to establishing efficient water transportation to this particular Project site. However, the Proponent acknowledges the importance of water transportation in the City of Boston and supports Mayor Menino's vision to enhance water transportation options to East Boston by instituting regular water shuttle service between the South Boston and East Boston waterfronts. As such, the Boston HCA includes a contribution that will assist the City in establishing this service.

Many of the sustainable design elements considered by the Green Team are innovative, creative, and atypical for projects of this type and scale. Such elements currently included in the Project design and configuration include:

- Cogeneration: the core system equipment, from Massachusetts company Tecogen, is based on relatively new and advanced technology and is being combined with thermal energy storage to greatly improve system operation and economics, and includes:
    - Emissions Reduction Technology (nitrogen oxides, carbon monoxide, volatile organic compounds) for small/medium-scale rich-burn cogeneration engines that significantly exceeds current standards (on track to become BACT Standard for California Air Resources Board);
    - Variable-speed, water-cooled, permanent-magnet generator and water-cooled inverter based cogeneration system that improves part-load performance, eliminates issues with uneven cooling of generator and power electronics, and enhances the cogeneration system's ability to follow the thermal loads for the building;

- Organics to energy: the Proponent is working with an off-site anaerobic digester facility, Massachusetts-based Harvest Power, and will be a key supplier for this facility;

- Smart-Grid: the backup generation equipment (and, to a small extent, the cogeneration equipment) will be configured to support smart-grid applications for Emergency Demand-Response and Economic Demand-Response needs;

- Solar: the Project design includes an approximately 2.7 MW PV system, of which approximately 1.45 MW will be building mounted, one of the largest private building-mounted PV arrays in the northeast United States;

- LED lighting: these fixtures will be used throughout the Resort to reduce overall energy consumption, with some of the applications including areas in the hotel, casino, garage, and exterior path lighting;

- Electric and Energy-Efficient Vehicles: the Proponent will purchase electric and energy-efficient vehicles where economically feasible, including vehicles proposed to make up the fleet of the extensive ground shuttle program;

- Heat Recovery Ventilation: heat recovery will be used to "recycle" heat in airstreams leaving the building, helping prevent it from escaping in winter and from entering in summer;

- Outside Air Pre-Conditioning (decoupling latent and sensible loads): this will allow the use of heating to be reduced while enabling good air distribution and indoor air quality;

- Occupancy-based controls: these will be included in guest-room thermostats in the proposed hotels;

- Hotel room automation;

- Daylighting control;

- Occupancy-based (carbon dioxide) ventilation control; and

- Hydronic economizer.

The Proponent and Green Team have also considered a number of sustainable design measures and technologies that have not been included in the Project design for various reasons. These are described in further detail in Section 7.4.

2.1 Site and Sustainable Design

The Proponent is committed to setting a new standard of excellence in sustainable design for gaming development projects around the world. The Proponent will achieve LEED Gold certification for the Project, which will be sustainably designed, energy efficient,

environmentally conscious, and healthy for its employees and visitors. Caesars has implemented an integrated design approach to review and analyze the following sustainable strategies and to achieve these sustainable goals and commitment to the City and the surrounding communities. Regular interdisciplinary meetings have been held since Project inception to ensure a fully integrated interdisciplinary approach to sustainability.

The approach to the proposed landscape design embraces the history of the Project site, its unique location between the waterfronts of Boston, Revere, and Chelsea, and its evolution over the last 100 years into an active racetrack and clubhouse. In fostering a regenerative approach to the site and landscape design, the Project will connect nature, people and place. Numerous goals for the Project and site design are tied to sustainability:

- *Understand the land and its history, and embrace the unique location:* Embrace the site's unique location, nestled between two of the historic waterfronts in Boston Harbor. Acknowledge the history of its marshes, creeks, and islands as well as the site's transformation over the last 100 years into the racetrack.

- *Restore landscape ecology:* Reduce impervious pavement on site and restore an ecological landscape that serves as green infrastructure, creates diverse public spaces, and provides an educational amenity to the neighborhood and visitors.

    - The proposed design will reduce impervious pavement by approximately 14 acres and add approximately 16 acres of open space.

    - The design promotes a diversity in the style of open spaces that ranges from active pedestrian plazas to passive ecological parks, offering a variety of amenities for public use.

- *Connect neighborhoods and ecosystems:* Connect the neighborhood and visitors to the Resort and its surroundings through a network of pedestrian walkways and bikeways. The design aims to promote pedestrian circulation and create a unique arrival sequence and visitor experience that embraces the setting of the site near the last remaining salt march in the City of Boston, and a landscape for the resort which is outwardly focused.

- *Develop innovative green infrastructure and pursue sustainable systems:* Use the landscape design to purify stormwater, improve soils, provide opportunities for environmental education, and create a cherished and elegant landscape.

- *Be innovative and sustainable:* Develop a landscape which embraces the beauty of native vegetation and is also low-maintenance and has low irrigation demand.

- *Make parking beautiful and functional:* Design parking lots to improve the visitor experience.
    - A series of planted bioswales along the parking bays will collect stormwater.
    - Shaded walkways, in many cases also supporting solar panels, will provide connections to public spaces and buildings.
- *Be creative:* The roof of Casino Area II will feature a 5,600-square-foot greenhouse with a hydroponic planting system that will produce fresh vegetables and fruits year-round for restaurants in the facility, thereby reducing the demand for delivery trucks.
- *Establish a framework for the future:* Use a balanced cut-and-fill soil strategy across the site. Connect the Resort landscape with the greater East Boston network of public open spaces.
- *Be resilient in response to climate change:* Use site and building design measures that are intended to make the Resort adaptive to climate change and its effects, including sea level rise:
    - The Project will increase the capacity of floodplain storage capacity by approximately 60,000 cubic feet;
    - A significant portion of Tomasello Drive will be raised above the potential future 100-year coastal storm flood elevation of 18.7 feet that may occur at high tide accounting for sea level rise;
    - The Project will reduce stormwater runoff from the site by increasing pervious surfaces and harvesting rainwater from roof areas for reuse;
    - First-floor elevations of proposed buildings will be at elevation 28 feet, significantly higher than anticipated flood elevations accounting for sea level rise and storm surge;
    - Critical mechanical and electrical equipment will be located between elevations 24 and 28 feet, significantly higher than anticipated flood elevations accounting for sea level rise and storm surge;
    - Small pumps will be located in lower levels of the parking garage and casino buildings to evacuate stormwater from these areas; and
    - Space will be reserved for future expansion of the major mechanical and electrical systems if needed to adapt to climate change, for example by adding emergency generators to increase the facility's capability of sheltering the public or by adding heating and cooling capacity.

2.2 LEED Credits and Certification

As required under Article 80, sub-Article 37 'Green Buildings' of the Boston Zoning Code, projects that are subject to Article 80B, Large Project Review, shall be LEED certifiable. There are seven categories in the LEED certification guidelines: Sustainable Sites, Water Efficiency, Energy and Atmosphere, Materials and Resources, Indoor Environmental Quality, Innovation in Design Process, and the additional Regional Priority Credits. The Proponent is targeting several credits which span the seven categories and enable the Project to meet the Zoning requirement, as described below.

The Proponent is committed to achieving the LEED NC v2009 Gold Certification level with 63 credit points.

The following subsections contain a detailed credit-by-credit analysis of how the sustainable design measures incorporated into the Project translate to the LEED NC v2009 rating system. Please refer to the LEED NC v2009 Project Scorecard provided in Attachment E for a summary of the prerequisites and credits targeted for the Project.

Please note that credits listed in *italics* below are either still under consideration for inclusion in the Project or are not being attempted.

2.2.1 Sustainable Sites

The Project site is a previously-developed site in a dense urban neighborhood adjacent to the MBTA Blue Line. MBTA bus routes also pass by, and could pass through the Project site should the MBTA decide to do so. The overall site design and integrated landscaping will address the capture and treatment of stormwater, and the Project design will increase the pervious area on the site by approximately 14 acres relative to existing conditions. The proposed landscape design takes a natural approach, and planting design will extensively use native and adaptive species, reducing the need for potable water for irrigation.

Site stormwater will be re-charged and captured to the extent possible. Rainwater from roofs will be captured and stored to reduce potable water use demand for irrigation and for cooling tower make-up water. Stormwater discharged from the site will be treated to remove at least 80% of TSS.

Parking will be accommodated in multiple surface parking lots complimented by pedestrian walkways and landscaping as well as a new multi-level parking structure that will accommodate approximately 2,550 cars.

The design process of the off-site roadway improvements will seek to incorporate sustainability principles wherever possible. With MassDOT's GreenDOT Policy Directive as a guide, the Proponent will work with appropriate public and private stakeholders to consider, incorporate, and implement planning and design criteria and guidance from such sources as the Greenroads Foundation's Greenroads Rating System and the Institute for

Sustainable Infrastructure's Envision Sustainable Infrastructure Rating System. These programs are designed to encourage technically superior design outcomes with long-term metrics for environmental performance.

Designated bikeways will extend to and through the site and link major roadways, the East Boston Greenway, Revere Beach, and Belle Isle Marsh to Resort buildings and the MBTA Blue Line stations.

Prerequisite 1 Construction Activity Pollution Prevention

The Construction Manager will submit and implement an Erosion and Sedimentation Control Plan for construction activities related to demolition of existing and construction of new buildings specific to this Project. The Plan will conform to erosion and sedimentation requirements of the 2003 EPA Construction General Permit and specific municipal requirements for the Cities of Boston and Everett. In addition, the Project is required to submit a NPDES-compliant SWPPP, a draft of which is included in Attachment F.

During construction, the Construction Manager will implement appropriate measures to control dust and particulate matter on site, as well as measures to protect area waterways from silt run-off.

SSc1 Site Selection

This credit is NOT being pursued due to the proximity of the existing grandstand building and racetrack to natural wetlands areas.

Credit 2 Development Density and Community Connectivity

The Project site contains the existing Suffolk Downs racetrack, grandstand, and associated elements. The surrounding community includes low-rise housing, restaurants, shops, grocery stores, educational and religious institutions, and other community amenities. There is access to multiple modes of public transportation, including several bus lines and the MBTA Blue Line subway.

Credit 3 Brownfield Redevelopment

The existing building areas to be renovated include asbestos-containing materials (ACMs). The Construction Manager will implement a compliant ACM abatement and removal plan. Local, state, and federal regulations shall be followed regarding the safe removal and disposal of ACMs.

Credit 4.1 Alternative Transportation, Public Transportation Access

The MBTA's Suffolk Downs Station is located approximately a quarter mile from the Project site. In addition, bus routes pass directly adjacent to or in close proximity to the Project site, and if deemed desirable by the MBTA may be re-routed to travel through the site as part of the standard route once stage 1 construction is complete.

Credit 4.2 Alternative Transportation, Bicycle Storage

Bike storage locations and changing rooms for full time employees will be included in the Project. Bikes for visitors will be valet parked, and the bikes will be stored in a designated secure portion of the underground parking structure. An appropriate quantity of bike storage locations and showers/changing rooms will be incorporated into the Project design, though it may not meet the total amount required to achieve this LEED credit point.

Credit 4.3 Alternative Transportation, Low-Emitting & Fuel-Efficient Vehicles

The new surface parking lots and multi-level parking garage will have designated preferred parking spaces for Low-Emitting and Fuel-Efficient Vehicles. In addition, electric vehicle charging stations will be provided at select locations disbursed throughout the parking areas.

Credit 4.4 Alternative Transportation Parking Capacity

The quantity of available parking spaces in the new parking garage and surface parking will target a level that will not exceed the quantity allowed by local zoning requirements. Preferred parking spaces will be designated for vanpool and carpool vehicles. Preferred parking spaces for carpools and vanpools will equal not less than 5% of the total number of spaces available.

Credit 5.1 Site Development, Protect or Restore Habitat

The proposed landscape design for the Project includes significant use of natural and adaptive species throughout the site; however, it may not be possible for the Project to meet the specific criteria of the LEED credit. In addition, an approximately 5,600-square-foot greenhouse will be installed with the intent that fruits and vegetables grown within will be used by the restaurants and bars on site.

Credit 5.2 Site Development, Maximize Open Space

The amount of open space on the Project site will exceed the amount of open space on the existing site by approximately 20%. Some landscaped open areas will be accessible for public use, and pedestrian-oriented hardscape will improve the urban open space.

Credit 6.1 Stormwater Design, Quantity Control

Stormwater will be captured from roofs and hardscape areas and will be collected for re-use within the irrigation system and for cooling tower make-up. In addition, the site design will increase pervious area by approximately 14 acres relative to existing conditions, and stormwater management will include infiltration and recharge into the groundwater system through improved absorptive landscaped areas designed with native and adaptive plantings.

Credit 6.2 Stormwater Design, Quality Control

The proposed landscape design incorporates natural features to encourage recharge and mitigate stormwater runoff. Stormwater will be treated to remove a minimum of 80% of the TSS prior to discharge.

Credit 7.1 Heat Island Effect, Non-Roof

This Project will increase pervious surfaces on-site by creating landscaped open areas; in addition, the Project will use light-colored hardscape surfacing materials that meet or exceed Solar Reflectivity Index (SRI) value limits. A minimum of 50% of the parking will be located in a new parking structure.

Credit 7.2 Heat Island Effect, Roof

The roofing material will be light colored high-albedo TPO roof membrane with a minimum SRI of 78. High-albedo roof will cover at least 75% of the Project roof area.

2.2.2 Water Efficiency

The Project design will specify low-flow, high-efficiency, and/or waterless plumbing fixtures, high-efficiency irrigation systems, and will capture rainwater for reuse to reduce potable water use within the Resort. Restaurant tenants will be encouraged to specify low-water-use commercial kitchen equipment.

Prerequisite 1 Water Use Reduction, 20% Reduction

Through the use of low-flow, high-efficiency plumbing fixtures and waterless urinals, the Project will implement potable water use reduction strategies that use more than 20% less potable water than the baseline calculated for the building (not including irrigation) after meeting Energy Policy Act of 1992 fixture performance requirements.

Credit 1.1 Water Efficient Landscaping, Reduce by 50%

The Project will include a permanent irrigation system. Landscape design will incorporate native and adaptive plant materials, and a high-efficiency irrigation system will target a 50% reduction in potable water use when compared to a mid-summer baseline. Rainwater will be captured and stored on site, and a portion of that harvested rainwater will be available for use in the irrigation system to reduce on-site potable water use (see Section 9.2.3).

Credit 1.2 Water Efficient Landscaping, No potable water use or irrigation

This credit is not being attempted as it is not possible to provide 100% of the irrigation water demand through rainwater capture. Due to requirements, some irrigation will be required to maintain the racetrack infield and some ornamental landscaped areas. As indicated above, rain and stormwater will be captured and a portion will be re-used to mitigate the potable water demand for irrigation.

Credit 2 Innovative Wastewater Technologies

This credit is not being attempted. The Proponent considered using captured stormwater for sewage conveyance; however, due to the high cost of piping for both grey and potable water, it was determined be infeasible for this Project.

Credit 3 Water Use Reduction

Specified fixtures will include high-efficiency toilets, waterless urinals, low-flow lavatory faucets, and low-flow shower heads. The Proponent will target an overall potable water use savings of at least 30% above the calculated baseline.

2.2.3 Energy and Atmosphere

The Project will have a high-performance building envelope and high-efficiency building systems. An extensive PV array will be installed with a goal to generate approximately 10% of the Project's electricity use on-site. A combined heat and power (CHP) system will be constructed for use in supporting the domestic hot water demand. In addition, organic waste materials will be collected and supplied to a Massachusetts anaerobic digester facility.

The building heating, ventilation, and air conditioning (HVAC) and commercial refrigeration systems will be selected to reduce harm to the ozone layer and potential GHG emissions. The Proponent will engage a Commissioning Agent to confirm that building systems are installed and function as intended and designed.

Prerequisite 1 Fundamental Commissioning of the Building Energy Systems

A third party Commissioning Agent (CxA) will be engaged by the Proponent for purposes of providing basic and enhanced commissioning services for the building energy related systems including HVAC & R, lighting, and domestic hot water. The CxA shall verify that building systems are installed, calibrated, and perform to meet the requirements of the building owners' Project requirements.

Prerequisite 2 Minimum Energy Performance

The estimated building energy use will demonstrate a minimum of a 10% improvement when compared to the baseline building performance when calculated using the rating method in Appendix G of ANSI/ASHREA/IESNA Standard 90.1-2007. A whole building energy simulation will demonstrate the projected energy savings for the Project.

Prerequisite 3 Fundamental Refrigerant Management

Specifications for refrigerants used in the building HVAC and the commercial refrigeration systems will NOT permit the use of CFC based refrigerants.

Credit 1 Optimize Energy Performance

The proposed building systems will target a performance level which is at least a 15% improvement over a baseline building performance rating. The team will develop a whole building energy model to demonstrate the expected performance rating of the designed building systems. The Project will incorporate a central heating and cooling plant and target lighting power densities below code minimums.

Credit 2 On-Site Renewable Energy

The Project includes an extensive on-site PV array that will provide approximately 10% of the Project's estimated electricity use.

Credit 3 Enhanced Commissioning

The CxA will be engaged early in the design process to review Project requirements, create, distribute, and implement a commissioning plan, and to perform a design review of the design development and construction documents.

Credit 4 Enhanced Refrigerant Management

Long life high-efficiency mechanical equipment will be specified for the HVAC systems, and refrigerants specified for the systems will have low ozone-depletion and global warming potentials. Commercial walk-in coolers must be included in the calculations for credit compliance. Credit achievement is based on the final calculated amount of refrigerant in the system.

Credit 5 Measurement and Verification

Caesars Entertainment will develop and implement a measurement and verification plan for the Project. In addition, Caesars Entertainment will establish an Energy Star Portfolio Manager account to enable the USGBC to review whole building energy and water use for five years after occupancy.

Credit 6 Green Power

Caesars Entertainment will purchase Renewable Energy Certificates via a two-year renewable energy contract to provide a minimum of 35% of the building's electricity from renewable sources. In addition, the proposed solar array, at approximately 2.7 MW, will account for approximately 10% of the Resort's electricity consumption.

2.2.4 Materials and Resources

Throughout Project construction, the Construction Management team will endeavor to divert construction and demolition waste from landfills. To the extent possible, products and materials will have recycled content and will be procured from regional sources.

Prerequisite 1 Storage and Collection of Recyclables

Collection of recyclables including paper, cardboard, glass, plastic, and metal will be accommodated throughout the Resort buildings. Collection stations will be located in highly visible locations throughout the Resort, and on a regular basis collected materials will be transported to a central storage location. Food and organic waste will be collected and transported to a Massachusetts-based anaerobic digester plant for conversion to energy and compost. The Proponent will contract with Harvest Power, North America's largest organics management company, and Harvest will provide the Proponent with a Complete Organics Recycling program for all organic waste generated from the facility. Management of the estimated 3,100 tons of source-separated organics (SSO) generated annually will include hauling, disposal, processing, and all equipment and systems both inside and outside the property. In addition, Harvest Power will provide the management software and a sustainable reporting system to manage and report waste generation data. Through the Complete Organics Recycling program, Harvest Power will provide a customized

education and training program for the staff, including management personnel and hourly employees, which will be conducted in English, Spanish, and French as necessary. The SSO will be transported to an anaerobic digestion facility to be constructed in Massachusetts.

Credit 1.1 and 1.2 Building Reuse

These credits are not being pursued. The Project will reuse the entire existing grandstand building, with extensive renovations planned for the lower levels. However, due to the size of the new development, the Project does not meet the specific credit requirements.

Credits 2.1 and 2.2 Construction Waste Management

Prior to the start of construction, the Construction Management team will prepare a Construction Waste Management plan for implementation on site. The plan will include directions for handling demolition debris as well as for waste generated during construction. The goal is to divert at least 75% (by weight) of the demolition debris and construction waste from landfills.

Credits 3.1 and 3.2 Materials Reuse

The Project is not attempting these credits. If applicable, the Proponent may consider materials reuse; however, due to the high-end nature of the interior finishes for the proposed casino spaces, hotel, and restaurant, the Project will not attempt to meet the credit requirements.

Credits 4.1 and 4.2 Recycled Content 10%/20% (post-consumer & ½ pre-consumer)

Project specifications will require materials to include pre- or post-consumer recycled content. The Project will utilize at least 10% recycled materials (measured by cost), with a goal to achieve the 20% threshold. The Construction Manager will track the recycled content of each material with a Project goal to achieve 10% recycled-content materials based on overall Project materials costs.

Credit 5.1 and 5.2 Regional Materials, 10%/20% Extracted, Processed and Manufactured Regionally

Project specifications will indicate materials to be extracted, harvested, recovered, and manufactured within a 500-mile radius of the site. The Project has a goal to provide a minimum of 10% regionally sourced materials based on overall Project materials costs. The Project will endeavor to achieve the 20% threshold.

Credit 6 Rapidly Renewable Materials

The Project is not attempting these credits. If applicable, the Proponent may consider the use of Rapidly Renewable Materials; however, due to the high-end nature of the interior finishes for the casino spaces, hotel, and restaurants, the Project will not attempt to meet the credit requirements.

Credit 7 Certified Wood

The Project will use FSC and sustainably harvested wood to the extent possible and may achieve the credit requirement to provide a minimum of 50% FSC certified wood for wood permanently installed inside the building envelope.

2.2.5 Indoor Environmental Quality

Air quality will be monitored during Project construction and will be tested prior to occupancy. Low-emitting materials will be used throughout the Resort to maintain and improve air quality for construction personnel on site as well as future occupants. Building occupants will be able to maintain a comfortable environment through access to thermal and lighting controls.

Prerequisite 1 Minimum IAQ Performance

Building mechanical systems are designed to meet or exceed the requirements of ASHRAE Standard 62.1-2007 sections 4 through 7 and/or applicable building codes. Naturally ventilated spaces such as the hotel rooms shall comply with the applicable portions of ASHRAE 62.1.

Prerequisite 2 Environmental Tobacco Smoke Control

The entire resort shall be a non-smoking environment.

Credit 1 Outdoor Air Delivery Monitoring

The Project will incorporate permanent carbon dioxide sensors and outside airflow measuring stations and devices to provide feedback on the performance of the HVAC system. Devices shall be programmed to generate an alarm when conditions vary by 10% from a set point.

Credit 2 Increased Ventilation

This credit is not being pursued. The Project will improve the breathing zone outdoor air ventilation rates in regularly occupied spaces; however, the Project is unlikely to achieve the credit requirement to achieve a level of 30% above the required minimums of ASHRAE 62.1-2007.

Credit 3.1 Construction IAQ Management Plan (during construction)

The Construction Manager will develop an Indoor Air Quality Management Plan for construction and pre-occupancy phases of the Project to meet or exceed the recommended Control Measures of the SMACNA IAQ Guidelines for Occupied Buildings Under Construction 2nd Edition 2007, ANSI/SMACNA 008-2008 (Chapter 3). Absorptive materials stored on site will be protected from moisture damage.

Credit 3.2 Construction IAQ Management Plan (before occupancy)

After the completion of construction and prior to occupancy, Caesars Entertainment may decide to conduct baseline IAQ testing to demonstrate contaminant maximum concentrations are not exceeded.

Credits 4.1 Low-Emitting Materials, Adhesives & Sealants

Specifications include requirements for adhesives and sealants to meet low Volatile Organic Compound (VOC) limits for adhesives and sealants installed within the building envelope.

Credits 4.2 Low-Emitting Materials, Paints and Coatings

Specifications include requirements for paints and coatings to meet low VOC limits for paints and coatings installed within the building envelope.

Credits 4.3 Low-Emitting Materials, Flooring Systems

Specifications will include requirements for hard surface flooring materials to be Floor Score certified, and carpet systems will endeavor to comply with the Carpet Institute Green Label program. Several carpets may be custom fabricated and may not be able to demonstrate compliance with CRI programs as required.

Credit 4.4 Low Emitting Materials, Composite Wood and Agrifiber Products

The Project will specify and install composite wood and agrifiber products that contain no added urea-formaldehyde.

Credit 5 Indoor Chemical and Pollutant Source Control

The Project team will design buildings to minimize and control the entry of pollutants and to contain chemical use areas. Entryway systems will be installed at all regularly used building entrances.

Credit 6.1 Controllability of Systems, Lighting

This credit is not being pursued. The Project will include applicable lighting controls in all back of house offices and support spaces and within the hotel guest rooms; however, due to the need for specific lighting applications in the gaming and dining areas, the Project cannot achieve the requirements of this credit.

Credit 6.2 Controllability of Systems, Thermal Comfort

This credit is not being pursued. The Project will include applicable thermal controls in all back of house offices and support spaces and within the hotel guest rooms; however, due to the need for specific controls in the gaming and other assembly areas, the Project cannot meet the requirements of this credit.

Credit 7.1 Thermal Comfort, Design

The Project's HVAC design will comply with ASHRAE 55 for all applicable mechanically ventilated regularly occupied spaces.

Credit 7.2 Thermal Comfort, Verification

The Proponent may choose to conduct an annual anonymous survey to determine if employees are comfortable in their work environment.

2.2.6 Innovation & Design Processes

The team has identified several possible ID credits, limited to five ID credits total. ID credits under consideration are identified below.

Exemplary Performance for SSc4.1

The Project site is located on several bus and transit routes with a frequency of service that may include over 200 transit rides per day.

Exemplary Performance for MRc2.2 Construction Waste Management

The goal is to divert at least 75% (by weight) of the demolition debris and construction waste from landfills. Due to the inclusion of recyclable demolition debris, however, it is likely the Construction Manager could divert 95% of the demolition and construction waste by weight from landfills.

Building as an Educational Tool

The Proponent will implement two public outreach programs to inform the public about the sustainable design features incorporated into the Project.

Reduced Process Water Use

The Project will target a reduced process water load for the building cooling systems.

Green Housekeeping

Caesars Entertainment will implement a cleaning program that uses "green" cleaning products.

Credit 2 LEED Accredited Professional (required ID credit for LEED certification)

A LEED AP will provide administrative services to oversee the LEED credit documentation process.

2.2.7 Regional Priority Credits

Regional Priority Credits (RPC) are established LEED credits designated by the USGBC to have priority for a particular area of the country. When a project team achieves one of the designated RPCs, an additional credit is awarded to the project. RPCs applicable to the Boston area include: SSc3, SSc6.1, SScC7.1, EAc2, and MRc1.1. The Proponent expects to achieve three RPCs: (1) SSc6.1 Stormwater Design, Quantity Control; (2) SSc7.1 Heat Island Effect, Non-Roof; and (3) SSc7.2 Heat Island Effect, Roof.

The Proponent will explore parameters of the following rating systems and metrics, and will endeavor to incorporate applicable elements into the Project, where feasible:

- International Dark Sky Association: The Proponent will explore the possibility of establishing some park areas within the Master Site that meet requirements of International Dark Sky Parks.

- International Living Future Institute: Living Building Challenge is a rigorous green building certification program. To be certified under the Challenge, projects must meet a series of ambitious performance requirements including net zero energy, waste, and water over a minimum of 12 months of continuous occupancy. Due to the 24/7 operations inherent in this type of project, the Project would have an extremely difficult time meeting criteria for this performance standard.

- Zero Net Energy (ZNET) buildings and projects: The Proponent is exploring the possibility of making the proposed maintenance building a zero net energy building.

- 2030 Architectural Challenge: The Project design contains numerous measures that will significantly reduce GHG emissions. These measures are described in the GHG emissions analysis in Section 7.2.

2.3 Climate Change and Adaptation

Climate change, climate change adaptation, and climate change resiliency are increasingly becoming a part of the daily vernacular, and these subjects are the topics of much study and debate. With increasingly warmer average temperatures and more frequent and intense storm events, the scientific consensus is that climate change is a reality and that it requires preparation and adaptation. All 50 states experienced a warmer than average year in 2012, and effects from Superstorm Sandy made the potential scale of threats and impacts from climate change more tangible.

As part of the preparation of the site and building design processes for this Project, the Proponent and its development team gave climate change and its ramifications significant consideration. This section describes the Project team's research into climate change and measures that have been incorporated into the Project's design to ensure it will have a significant measure of climate change resiliency.

Most of the mechanical and electrical systems, including all major equipment and critical life safety equipment (e.g., generators, associated switchgear, and distribution) will be located above elevation 24 feet (Boston City Base, BCB) to help ensure they will not be taken down by a climate change-related event.

Space is being reserved for future expansion of the major mechanical and electrical systems if needed to adapt to climate change, for example by adding emergency generators to increase the facility's capability of sheltering the public or by adding heating and cooling capacity.

2.3.1 Integrating Mitigation and Adaptation

First and foremost, the Project design goal is to reduce its ecological footprint and mitigate potential GHG emissions that contribute to climate change and its effects, including sea level rise. Using an integrated design approach, the Proponent's design team has developed conservation and efficiency strategies that will reduce energy consumption, and the Project also includes a significant amount of on-site renewable energy generation from an extensive PV array. Other energy-related design measures, including CHP and daylighting, are discussed in Sections 9.4 and 9.5. The balance of this section also describes "Smart Growth" low-impact development (LID) and LEED strategies incorporated into the Project.

2.3.2 Enhance Emergency Preparedness

Hazard mitigation, evacuation, and emergency response plans for the Resort will reflect the needs of the new development to respond to current risks as well as future effects from climate change. The Proponent will develop partnerships with local and state agencies to coordinate efficient responses to climate change events. Caesars is accustomed to assembling detailed response plans for each of its facilities that are tailored to the specific

features and risks of each geographic location. Although the response plan for the Resort is still under development, a sample response plan is provided in Attachment G. In addition, the site has been designed proactively to make it resilient to climate change issues such as sea level rise (see Section 2.3).

2.3.3 Ecosystem-Based Adaptation

The Project will restore and protect natural ecosystems to increase their viability and strengthen their functions and values. Natural ecosystems provide resilience and reduce the vulnerability of natural and built environments to hazards. The natural habitats on the Project site will serve as ecological infrastructure to reduce risk posed by some climate change impacts, including increased storm frequency. Project design measures, including increasing pervious surfaces by 14 acres and managing stormwater, will promote infiltration and reduce stormwater discharge from the site.

2.3.4 Climate Change Analysis and Proactive Site Design

The Project team has developed a landscape design that responds to the threat of sea level rise by elevating buildings, critical mechanical and electrical equipment, roadways, and access points in a manner that will maintain site access and building safety and operations during future coastal storms assuming sea level rise; this will enable the Project site to function as a safe haven for the community should an extreme event occur. In such an event, access for emergency vehicles would be available at the Bennington Street gate to the property.

The Project team reviewed a number of published reports while studying climate change and its implications for the Project. While no report can definitely estimate the impacts of climate change, perhaps the most quantifiable measure of climate change is sea level rise. Scientific literature contains reports with a wide range of sea level rise predictions, usually carrying those predictions through the middle and end of the century. Despite the variability in predictions, one noticeable trend in the literature over the past decade or more is that estimated sea level rise appears to be trending higher as more studies and analyses are performed. Reports reviewed and consulted during ongoing Project design include:

- Intergovernmental Panel on Climate Change (IPCC). 2007. *Climate Change 2007: The Physical Science Basis.* Contribution of Working Group I to the Fourth Assessment Report of the Intergovernmental Panel on Climate Change.

- Pfeffer, et al. 2008. *Kinematic Constraints on Glacier Contributions to 21st–Century Sea Level Rise.* Science. Vol. 321, no. 5894. pp. 1340-1343.

- Massachusetts Executive Office of Energy and Environmental Affairs and the Adaptation Advisory Committee. 2011. *Massachusetts Climate Change Adaptation Report, September 2011.*

- Douglas, Ellen M.; Kirshen, Paul H.; Paolisso, Michael; Watson, Chris; Wiggin, Jack; Enrici, Ashley; and Ruth, Mathias. 2011. *Coastal flooding, climate change and environmental Justice: Identifying obstacles and incentives for adaptation in two Boston Metropolitan communities.* Published in "Mitigation and Adaptation Strategies for Global Change," October 21.

- Douglas, Ellen; Kirshen, Paul; Li, Vivian, Watson, Chris; and Wormser, Julie. 2013. *Preparing for the Rising Tide.* Published by The Boston Harbor Association, February.

As mentioned above, there is no consensus on the rate or magnitude of future sea level rise. For example, the IPCC report estimates that global average sea level will rise 7.2 to 23.6 inches by the year 2100, and acknowledges there may be substantial variability in sea level rise depending on geographic location. The Pfeffer report, on the other hand, concludes that the most likely range of sea level rise by 2100 is 2.5 to 6.6 feet, but also acknowledges that "substantial uncertainties" exist regarding this estimate. The most current thinking is that sea level will rise between 6 and 16 inches by 2050, and between two and six feet by the year 2100.

The most recent report, published by The Boston Harbor Association (TBHA) in 2013 ("Preparing for the Rising Tide") assesses impacts of sea level rise with storm surge throughout the City of Boston in three scenarios:

1. The first scenario estimates flooding impacts by adding 2.5 feet to the elevation of Mean Higher High Water (MHHW), essentially mimicking the flooding that was experienced in the City of Boston at high tide five hours before Superstorm Sandy's maximum storm surge hit.

2. The second scenario adds 5 feet to MHHW, thus estimating the impact that Superstorm Sandy would have had if the storm surge had hit during high tide.

3. The third scenario approximates the 100-year coastal storm surge at high tide when sea levels are approximately 2.5 feet higher than current levels, effectively adding 7.5 feet to existing MHHW to estimate flooding impacts that could occur at projected mid-century sea levels during a 100-year coastal storm surge at high tide.

The third scenario in the TBHA report has the most profound flooding impacts throughout the City of Boston, and it is the scenario that the Project team considered when proceeding through site and building design for the Project. Adding 7.5 feet to the existing MHHW elevation on the Project site yields a potential 100-year coastal storm flood elevation of 18.7 feet that may occur at high tide accounting for sea level rise. This elevation provides an important design benchmark for the Project's site design with regard to providing resiliency for sea level rise and storm surge.

When considering climate change and sea level rise, there are no standard accepted practices or regulatory standards associated with site and building design. Absent any standards or regulations regarding climate change preparation and adaptation, the Project team primarily relied on recent scientific literature as well as solid engineering judgment and common sense. The result is a site plan and building design that is resilient to climate change.

2.3.5 Floodplain

The existing 100-year floodplain elevation on the Project site is 15.46 feet BCB, and MHHW is 11.2 feet BCB. The 100-year floodplain is mapped throughout the Project site and is depicted by those areas below elevation 15.46 feet (see Figure 6-32 in Section 6.9, which shows the 100-year floodplain). In general, areas of the Project site within the existing 100-year floodplain include the stable areas at the northern end of the site, the parking lot located north of the existing building adjacent to Sales Creek, areas adjacent to the western property boundary near the wetlands, areas adjacent to Sales Creek, and portions of the racetrack infield. Floodplain elevations are based on Federal Emergency Management Agency (FEMA) Flood Insurance Rate Map (FIRM) Numbers 25025C0019G and 25025C0038G, effective September 25, 2009; floodplain areas on the Project site are described as Zone AE.

The Project design includes cutting and filling activities over approximately 600,000 square feet of the existing 100-year floodplain area on the Project site, including a part of the existing stable area north of Sales Creek in Revere, the parking lot south of Sales Creek and north of the proposed building, and areas located along Tomasello Drive to accommodate construction of the new roadway. Within the parking areas, the site has been designed to include both cut and fill areas, with a net gain in floodplain storage of approximately 52,200 cubic feet. A proposed parking area is located near the Resort entrance off Winthrop Avenue in the current location of stable buildings and in the existing 100-year floodplain. The stable buildings in this particular location are proposed to be demolished, and the grade in this area will be lowered to provide additional floodplain storage. Along Tomasello Drive from Route 1A and past the proposed parking garage, there will be fill associated with road construction to raise the proposed Tomasello Drive above elevation 18.7 feet (the projected 100-year floodplain elevation at high tide accounting for sea level rise). A large floodplain compensation area is proposed north of Tomasello Drive along the site entrance from Route 1A that will provide floodplain compensation for filling associated with construction of the new roadway. This proposed floodplain compensation area is sized to provide greater than required floodplain compensation volume on the magnitude of 8,000 cubic feet, contributing to the overall net new floodplain compensation volume of over 60,000 cubic feet.

As currently designed, the Project's cut and fill impacts within existing floodplain on the site are quantified in Table 2-1 and shown in Figure 2-1. These calculations document the proposed compensatory flood storage that has been incorporated into the Project design.

Table 2-1 Cut and fill impacts in existing 100-year floodplain along Tomasello Drive.

Elevation (feet)	*Fill (cubic feet)*	*Cut (cubic feet)*	*Net (cubic feet)*
Along Tomasello Drive			
14-15	3000	-9000	-6000
15-15.5	10000	-12000	-2000
total	*13000*	*-21000*	*-8000 (compensatory storage)*
North Parking Lot/CAFO Parking Lot			
11-12	800	-1000	-200
12-13	7000	-10000	-3000
13-14	20000	-27000	-7000
14-15	33000	-58000	-25000
15-15.5	19000	-36000	-17000
total	*79800*	*-132000*	*-52200 (compensatory storage)*
Total Site			
11-12	800	-1000	-200
12-13	7000	-10000	-3000
13-14	20000	-27000	-7000
14-15	36000	-67000	-31000
15-15.5	29000	-48000	-19000
total	*92800*	*-156000*	*-60200 (compensatory storage)*

As shown with the cut and fill numbers in Table 2-1, the Project site design will provide approximately 60,200 cubic feet of net additional floodplain storage. This new floodplain storage will serve two purposes: first, additional floodplain storage will help reduce off-site stormwater impacts (see Section 9.3 for a description of how off-site stormwater impacts will be reduced by less impervious surface, increased infiltration, increased water quality treatment, and rainwater harvesting); second, greater floodplain storage will accommodate additional water that may enter the site due to combined sea level rise and storm surge.

All floodplain areas on site are adjacent to wetlands and/or Sales Creek, and these areas represent the lowest elevation points on the property. The 100-year floodplain elevations on site are reached when water levels in both Sales Creek and the wetlands rise due to extreme storm events and essentially flood adjacent areas. The proposed site design will maintain these connections between floodplain, wetlands, and Sales Creek. The parking area located on the northern portion of the site will continue to experience flooding during extreme storm events due to rising water levels in Sales Creek. Along the Tomasello Drive entrance, the new floodplain compensation area will effectively accept water from adjacent wetlands displaced by construction and raising of the roadway.

The Proponent does not anticipate the need for large-scale pumping to evacuate storm or flood waters; however, some small pumps will be located in lower levels of the parking garage and casino buildings to evacuate stormwater that will drain into these areas. As described in Section 9.3, the Project design demonstrates resiliency to climate change since it will discharge less stormwater and will store significantly more water than under existing conditions. Therefore, the Project will reduce off-site impacts.

Resort buildings will be located outside of the floodplain, with the ground floor elevations of Casino Areas I and II well above the 100-year floodplain. Even the below-grade parking slab elevation will be located above the floodplain.

2.3.6 Sea Level Rise

The Project site has been designed to prepare for projected sea level rise as well as increased storm surges that may be caused by global climate change. The site has a natural advantage in terms of rising sea levels and storm surge due to its existing topography as well as its location between Chelsea Creek and the Belle Isle Marsh. Current upland elevations on site range between approximately 12.5 feet BCB (adjacent to Sales Creek) to approximately 28.5 feet (adjacent to the existing grandstand and clubhouse). Although some of the site is within the 100-year floodplain, the approximately 16-foot elevation change between low and high points provides a great amount of flexibility in creating a site design that is resilient to sea level rise (see Figure 2-2).

When designing the site, the Project team evaluated future sea level rise and storm surge conditions using a methodology similar to the approach used in TBHA's 2013 report, "Preparing for the Rising Tide." The Project team applied the same adjustments for projected sea level rise and storm surge that are described in the report to MHHW elevations on the site. As defined above, MHHW on the Project site is at elevation 11.2 feet. Applying the Scenario 3 elevation adjustment described in the TBHA report results in a storm surge elevation of 18.7 feet on the Project site, which includes an assumed sea level rise of 2.5 feet. This 18.7-foot elevation was used as a design elevation for locating and designing the proposed buildings, access, and critical infrastructure.

The Project entrance along Tomasello Drive via Route 1A is currently at approximately elevation 30 feet, but the roadway descends into the property and is mostly below elevation 18.7 feet throughout the site. Near the entrance from Winthrop Avenue, the elevation of Tomasello Drive is at approximately 15 feet. To mitigate the impacts of sea level rise and storm surge, the Project design includes substantially raising the elevation of a section of Tomasello Drive from Route 1A to a point just north of the proposed parking garage to bring it above elevation 18.7 feet. This will provide access to the site and proposed buildings from Route 1A even during severe storm events; including taking into account the effects of sea level rise (see Figures 2-2 and 2-3).

All proposed buildings will be located in the vicinity of the existing grandstand and clubhouse. First floor elevations of the proposed buildings will be at elevation 28 feet, which is significantly higher than current MHHW, 100-year floodplain, and the anticipated flood elevations accounting for both sea level rise and storm surge. All critical mechanical and electrical equipment needed to operate the buildings, including the heating plant, cooling plant, emergency generators, fire pump, gas service entrance, and ventilation equipment, will be located near the CUP that will be connected to Casino Area I. This equipment will be located adjacent to the CUP between elevations 24 and 28 feet (see Figure 2-3).

Underground parking below Casino Area II will have a floor elevation of 16.5 feet; this area will be used exclusively for vehicle parking, and vehicles will not be parked on this level during severe storm events. Pumps will be used to evacuate any water that accumulates in this parking level during extreme storm events. With regard to the proposed parking garage, the first-floor elevation will be at elevation 27.25 feet, while the below-grade floor elevation will be at elevation 16.25 feet. During severe storm events, these areas will not be occupied by people or vehicles. Pumps will be used to evacuate any water that accumulates in the garage during extreme storm events.

A number of factors generally protect the Project site from storm surge. Storm surge is typically evaluated through complex engineering models that take into account factors such as proximity to the shoreline, prevalent wind direction, amount of uninterrupted ocean that approaches the shoreline, topography of the site and surroundings, and topography below the ocean surface approaching the shoreline. Although Sales Creek experiences tidal influences, in general the site is well protected from open ocean or tidal bodies of water. Existing buildings on-site are located over one-half of a mile from Chelsea Creek and are separated from Chelsea Creek by the adjacent tank farm, Route 1A, and a variety of businesses located west of Route 1A. The tank farm is surrounded by containment berms that restrict the movement of fuel off the property in the event that one of the tanks ruptures. These berms are located just west of the Project property line adjacent to existing wetlands which are situated between the existing parking lots and the containment berms. The upper elevations of the berms vary but are generally between elevations 23 and 25 feet. Therefore, these berms have been constructed to an elevation that is four to six feet higher than the expected flood elevation described under Scenario 3 of the TBHA report. These berms will provide the Project site with significant protection from storm surge and will also ensure that any tank leaks will be contained off the Project site, even during an extreme storm event coupled with sea level rise.

The eastern portion of the Project site is approximately three-quarters of a mile from the coastline, and is separated from the coast by the Beachmont neighborhood, which is located on a drumlin with elevations that rise above 100 feet. Therefore, the site is not subject to direct coastal influences. During extreme storm events at high tides, water will rise in Belle Isle Marsh from the Boston Harbor, thus influencing Sales Creek since the

creek is connected to the Belle Isle Marsh through a tide gate at Bennington Street. The gate closes during high tide and storm events, providing the site with substantial protection from rising tidal waters in the Belle Isle Marsh. During extreme storm events at high tide, it is conceivable that water could pond along the eastern side of Bennington Street. The approximate road elevation along Bennington Street at the tide gate is 14 feet BCB, and elevations along Bennington Street directly east of the site range from 13 to 15 feet. Therefore, it is conceivable that floodwaters could overtop Bennington Street and flow into the Project site; however, it is unlikely that such floodwater would impact access to the site from Route 1A or the proposed buildings.

The proposed site design limits impacts from projected sea level rise and storm surge to areas on the northern portion of the property near the parking lot and existing horse stables. Even in those areas, however, the Project design will improve site resiliency by converting approximately 2.3 acres of the existing 23-acre stable area and lowering the elevation in this area to provide additional floodplain capacity. An additional benefit of this conversion is that it will also effectively reduce the spatial extent of the Concentrated Animal Feeding Operation by 2.3 acres, thus reducing CAFO waste discharged to the recently-installed sanitary system by approximately 10%.

2.3.7 Increased Frequency of Storms

One of the anticipated impacts from climate change is an increase in the frequency and intensity of storm events. In a July 2011 report entitled "Forging the Link – Linking the Economic Benefit of Low Impact Development and Community Decision," the University of New Hampshire's Stormwater Center evaluated climate change as part of a benefits analysis of LID stormwater infrastructure. This report suggested that design depths for specific storms will increase over time as climate changes and storms intensify.

As described in Section 9.3, the proposed Project uses LID stormwater design to promote infiltration and effectively reduce the potential impact from increased storm frequency and intensity. LID stormwater strategies have a number of benefits, including providing greater resiliency to climate change. The Project design uses water quality swales, bioretention basins, biofiltration swales, rainwater harvesting tanks, and pervious pavers to promote infiltration. Through careful site design, the Project will increase pervious surface on-site by approximately 14 acres relative to existing conditions.

2.4 Energy Conservation

The Proponent is committed to a sustainably designed and energy-efficient facility. Caesars' CodeGreen initiative focuses on building operations, its employees, guests, and suppliers to ensure a leadership position in environmental stewardship. Along with conservation and efficiency measures, on-site renewable strategies will be deployed to maximize energy savings. By incorporating numerous energy conservation measures into the Project design, the Proponent will reduce annual energy consumption by approximately 25% through

conservation strategies, efficiency measures, and on-site renewable production. Energy-consuming systems will be monitored and tracked using an advanced building management system and metering. This system will allow the Proponent to analyze and reduce energy consumption over time by identifying areas of high energy consumption for targeted reductions.

Multiple energy conservation strategies will reduce Resort energy consumption, including PV arrays which will generate approximately 2.7 MW of "carbon free" onsite renewable energy per year. The building-mounted portion of the PV system (approximately 1.45 MW) will be one of the largest private building-mounted PV deployments in the northeastern United States. The entire PV system will account for approximately 10% of the Resort's electricity consumption.

Heating and cooling will be generated through the use of high-efficiency systems that perform substantially better than what the building code requires, and high-performance low-e glazing paired with enhanced thermal performance wall and roof assemblies will reduce energy consumption and thermal loss. A CHP installation will provide heat and power to the Resort while producing fewer GHG than the equivalent utility-fed system. Engine(s) will be used to generate electrical power, and the heat produced by these engines will be used to heat water for use in the facility. This approach is far more sustainable (i.e., reduces carbon dioxide emissions) than using electricity and natural gas from "the grid". High-efficiency mechanical equipment will be used to provide heating and cooling.

Advanced lighting controls and architectural daylighting strategies will take advantage of natural light and reduce artificial lighting. Natural lighting will be used throughout the facility, including in gaming spaces, allowing the lighting control system (which will use photocells, occupancy sensors, and other systems) to dim and shut off artificial lights when they are not needed. Interior and exterior lighting systems of the Resort buildings will employ high-efficiency fixtures, reducing energy consumption. Guest rooms will be equipped with smart controllers that shut off lighting and reduce heating and air conditioning when guests are not present, saving electricity and natural gas.

A high-performance air system design will reduce the energy required to move heating and cooling energy around the facility. Space heating, cooling and ventilation will be accomplished efficiently with less restrictive ventilation ducts, and high-efficiency fans, a design which will reduce energy consumption without compromising air quality or guest comfort. Heat recovery devices will reduce the amount of waste heat (including moisture) that leaves the facility.

High-efficiency plumbing fixtures (e.g., low-flow and waterless fixtures) will reduce the consumption of domestic hot water, thus reducing heating energy consumption. Economizer cycles (using air and water) will use outside, untreated air to cool the space when possible. A high-performance envelope will reduce envelope heat gain and loss. Metering provisions will allow the owner to monitor and improve building operations to reduce energy consumption.

Section 3.0

Regulatory and Legal Information

3.0 REGULATORY AND LEGAL INFORMATION

3.1 Project Identification and Project Team

Project Name:	Caesars Resort at Suffolk Downs
Address/Location:	Suffolk Downs Racecourse East Boston and Revere, Massachusetts
Developer	Sterling Suffolk Racecourse, LLC 525 William F. McClellan Highway P.O. Box 581 East Boston, MA 02128
Architects	Elkus/Manfredi Architects Ltd. 300 A Street Boston, MA 02110 (617) 426-1300 David Manfredi Kevin Lennon
Landscape Architect	Sasaki Associates, Inc. 64 Pleasant Street Watertown, MA 02472 (617) 923-7167 Gautam Sundaram Isabel Zempel
Permitting Consultants	Epsilon Associates, Inc. 3 Clock Tower Place, Suite 250 Maynard, MA 01754 (978) 897-7100 Elizabeth Grob Holly Carlson
Transportation and Parking Consultants	Vanasse Hangen Brustlin, Inc. 99 High Street Boston, MA 02110-2354 (617) 728-7777 David Black, Erica Guidoboni, John Kennedy, Douglas Landry

Legal Counsel	DLA Piper LLP (US) 33 Arch Street Boston, MA 02110-1447 (617) 406-6000 Charles A. Baker III Bryan Connolly Emma Rothfeld Yashar
Transportation Counsel	Foley Hoag LLP 155 Seaport Boulevard Boston MA Boston, MA US 02210-2600 617.832.1000 Jeffrey Mullan
Geotechnical Engineer	Haley & Aldrich 465 Medford Street, Suite 2200 Boston, MA 02129-1426 (617) 886-7304 Mark Balfe
Structural Engineer	McNamara/Salvia, Inc. 160 Federal Street Boston, MA 02110 (617) 737-0040 John Matuszewski
Civil Engineer	Nitsch Engineering, Inc. 186 Lincoln Street, Suite 200 Boston, MA 02111 (617) 338-0063 Scott Turner Gary Pease
Mechanical Engineer	Vanderweil Associates 274 Summer Street Boston, MA 02210 (617) 574-8132 Alex Vanderweil Joe Manfredi
Sustainable Design	The Green Engineer 50 Beharrel Street, Concord MA 978-844-1464 Christopher Schaffner Sarah Michelman

Estimated Commencement:	To be determined by the Gaming Commission (see Section 3.3.2)
Estimated Completion:	Approximately 24 months following commencement of construction (see Section 1.11.2)
Approximate Development Cost:	$1 billion
Status of Project Design:	25%

3.2 Regulatory Controls and Permits

3.2.1 History of Boston Redevelopment Authority and Massachusetts Environmental Policy Act Reviews

This section describes the current status of Project review under Article 80 of the City of Boston Zoning Code as well as MEPA.

3.2.1.1 City of Boston Article 80 Review

The Project is subject to Large Project Review pursuant to Article 80 of the Boston Zoning Code ("Article 80"). Consistent with Mayor Thomas M. Menino's Executive Order dated October 10, 2000 relative to the provision of mitigation by development projects in Boston, the Proponent has filed a Letter of Intent with the BRA prior the submission of a Project Notification Form for the Project and will seek a pre-review planning meeting with BRA as encouraged pursuant to Section 80B-5 of the Boston Zoning Code. To continue to facilitate review by the City of Boston, the Proponent has included in this DEIR/EPNF information required to be included in a typical Project Notification Form pursuant to Section 80B-5 of the Boston Zoning Code, as well as additional information responsive to comment letters that it received from City of Boston agencies on the EENF. To maximize coordination between the MEPA and Article 80 review processes the Proponent has filed a combined DEIR/EPNF.

3.2.1.2 Massachusetts Environmental Policy Act Review

The content of this DEIR/EPNF responds to the scope of analysis defined in the EEA Secretary's Certificate on the ENF issued April 5, 2013. A copy of the Certificate is included in Section 11.0, Response to Comments. While the Project does not involve financial assistance from the Commonwealth, MEPA jurisdiction extends to those aspects of the Project within the subject matter of required or potentially required state permits with the potential to cause Damage to the Environment as defined in the MEPA regulations (301

CMR 11.00), which in this case include: transportation, wastewater generation, air quality, land alteration/stormwater, wetlands, and GHG emissions. In addition, the subject matter of the Gaming License confers broad scope jurisdiction and extends to all aspects of the Project that may cause Damage to the Environment.

3.2.2 Anticipated Permits, Reviews, and Approvals

Table 3-1 contains a list of federal, state, and local agencies from which permits or other actions are or may be required.

Table 3-1 Anticipated Permits, Reviews, and Approvals Required for the Project

Agency	*Permit, Review or Approval*
Federal	
U.S. Environmental Protection Agency	National Pollutant Discharge Elimination System (NPDES) Construction General Permit (if required)
Federal Aviation Administration (FAA)	Notice of Proposed Construction/Determination; Federal Airspace review
State	
Executive Office of Energy and Environmental Affairs	Massachusetts Environmental Policy Act Review (incl. Public Benefit review for landlocked tidelands)
Massachusetts Department of Environmental Protection (MassDEP)	♦ Sewer Connection Permit ♦ Plan Approval or Environmental Results Program Certification (for stationary air pollutant sources) ♦ Demolition Permit ♦ Asbestos Removal Permit (if required) ♦ Superseding Order of Conditions (only upon appeal of local Order)
Massachusetts Office of Coastal Zone Management (CZM)	Federal Consistency Certification (if required)
Massachusetts Department of Transportation – Highway Division	♦ Vehicular Access Permit(s) (Category III) ♦ Non-Vehicular Access Permit ♦ Air Space Review
Massachusetts Water Resources Authority (MWRA)	♦ Sewer Use Discharge Permit (or waiver) ♦ Dewatering Permit (if required)
Massachusetts Gaming Commission	Category 1 Gaming License
Massachusetts Historical Commission	State Register Review
Massachusetts Department of Conservation and Recreation	Access Permit(s)
Municipal	
BOSTON	
City of Boston	Host Community Agreement Curb Cut Permit (if required)
Boston Civic Design Commission	Project Review
Boston Conservation Commission	Order of Conditions
Boston Fire Department	Fuel Storage Permit
Boston Redevelopment Authority and if required Boston Zoning Commission	♦ Applicable Zoning relief and Project Review to the extent required by the Boston Zoning Code. ♦ 121 A Agreement
Boston Public Works Department	Street Occupancy Permit

Table 3-1 Anticipated Permits, Reviews, and Approvals Required for the Project (Continued)

Agency	*Permit, Review or Approval*
Municipal	
Boston Transportation Department	Transportation Access Plan Agreement
Boston Public Improvement Commission	Approval of improvements to public streets
Boston Water and Sewer Commission	♦ Local Sewer Connection Permit and Site Plan Approval ♦ Drainage Discharge Permit, if required
Committee on Licenses	Flammable Storage License/Garage Permit
Inspectional Services Department	Building Permit
REVERE	
City of Revere	Host Community Agreement Approval of improvements to public streets
Building Department	Building Permit
Revere City Council	Applicable Zoning Relief and Project Review to the extent required by the Revere Zoning Ordinance
Revere Conservation Commission	♦ Flood Plain Approval ♦ Order of Conditions
Site Plan Review Committee	Site Plan Review
CHELSEA	
City of Chelsea	Approval of improvements to public streets
Chelsea Conservation Commission	Order of Conditions (off-site transportation infrastructure improvements)

3.3 State Gaming Process

3.3.1 Expanded Gaming Act

Chapter 194 of the Acts of 2011: An Act Establishing Expanded Gaming in the Commonwealth (the "Expanded Gaming Act") was signed into law by Governor Deval Patrick on November 22, 2011 with the goal of providing economic investment and job creation within the Commonwealth (and to continue to preserve racetracks in the Commonwealth, including the distribution of purse funds to those racetracks). The Expanded Gaming Act provides for the licensing of up to three destination resort casinos in diverse geographic locations within the Commonwealth as well as one slots facility and the creation of a Gaming Commission to oversee the implementation of expanded gaming within the Commonwealth. The Proponent plans to file an application with the Massachusetts Gaming Commission ("Commission") seeking a license to operate a Category 1 gaming establishment at Suffolk Downs pursuant to the provisions of M.G.L. chapter 23K (on August 10, 2012, the Proponent paid to the Massachusetts Gaming Commission a statutorily-established fee to commence that process and filed its RFA-1 suitability application with the Commission pursuant to the Commission's requirements set forth in more detail in Section 3.3.2 below). With the potential creation of approximately 2,500 construction jobs and more than 4,000 permanent jobs, as well as substantial proposed

investment in infrastructure and the local economy, the Project is in keeping with the economic development and job creation goals of the Expanded Gaming Act, as well as the goal of continued preservation of racetracks.

As referenced above, the Expanded Gaming Act provides for the licensing of three destination resort casinos and one slots-only facility and for the support, promotion, and encouragement of horse racing in the Commonwealth. The Expanded Gaming Act refers to a destination resort casino as a "Category 1" gaming establishment. A Category 1 Gaming License permits the licensee to operate table games, as well as slot machines, within the licensed gaming establishment. Additionally, the Expanded Gaming Act refers to the slots-only establishment as a "Category 2" gaming establishment and restricts the establishment to operating only slot machines.

Although the Expanded Gaming Act permits the Commission to license up to three (3) Category 1 gaming establishments, the Expanded Gaming Act restricts where those establishments can be located. The Expanded Gaming Act carved the Commonwealth into three separate and distinct regions: Region A, Region B, and Region C. The Commission is permitted to license up to one (1) Category 1 gaming establishment in each of the aforementioned regions. The Proponent is seeking to apply for and win the Category 1 Gaming License for "Region A." Region A consists of the following areas: Suffolk, Middlesex, Essex, Norfolk, and Worcester counties.

Under the Expanded Gaming Act, the single Category 2 gaming establishment is to be located in any of the aforementioned three regions of the Commonwealth.

The Massachusetts Legislature provided a number of protections to the communities of the Commonwealth when drafting the Expanded Gaming Act. The Act defines a community where a gaming establishment is located as a "host community." For purposes of the Expanded Gaming Act, the Proponent has two host communities: the City of Boston and the City of Revere.

An applicant for a gaming license must negotiate an HCA with its host community (or communities) prior to submitting an application to the Commission. (Note: the gaming license application process is discussed in detail in Section 3.3.2.) The HCA will set forth conditions for locating the gaming establishment within the community, as well as other requirements, such as a community impact fee. Additionally, applicants for a gaming license are required to hold and win a referendum in the host community (or communities) on the proposed location of the gaming establishment prior to submitting an application to the Commission. Applicants for a gaming license are also required to negotiate agreements with communities in proximity to the host community that are likely to experience impacts from the operation or development of the gaming establishment; these are referred to in the Expanded Gaming Act as "surrounding communities." Surrounding communities are not required to vote on the casino proposal, but surrounding community agreements ensure that the mitigation concerns of these communities are met.

3.3.2 Project Application Process

The Expanded Gaming Act contemplated that an applicant for a gaming license would submit a single application to the Commission, along with a non-refundable $400,000 application fee, for review. To expedite the arrival of the anticipated benefits of expanded gaming, the Commission altered the application process by creating a phased application process that enabled applicants to pay the application fee prior to submitting their gaming application and also bifurcated the application process into two separate application phases, referred to as RFA-1 and RFA-2. The Proponent took advantage of this early payment process and submitted its application fee to the Commission on August 10, 2012.

The RFA-1 phase of gaming applications refers to the background investigations conducted by the Investigations and Enforcement Bureau (IEB) of the Massachusetts Gaming Commission. The RFA-1 application review process began on January 15, 2013, which was the deadline for applicants to submit their background investigation forms. The Proponent submitted its RFA-1 application on January 15, 2013. In the normal course of review, the IEB has requested additional information from multiple applicants, including the Proponent. The Proponent has responded to all such requests from the IEB for additional information. The IEB is currently conducting the background investigations to determine if the Proponent is "suitable" for licensure in Massachusetts. The background investigations, or suitability reviews, consist of in-depth analysis of the applicants' personal as well as business records. The purpose of the background investigation is to ensure that those licensed to operate a gaming establishment in Massachusetts are individuals or entities that display the requisite level of integrity, honesty, and character.

The IEB anticipates that it will deliver its suitability recommendations for Category 1 applicants to the Commission in September 2013. In turn, the Commission will review the IEB's recommendations and vote to determine if the Proponent is suitable for licensure in the Commonwealth.

The RFA-2 phase of gaming applications refers to the site-specific gaming establishment proposal prepared by a gaming license applicant. A gaming license applicant may not advance to the RFA-2 phase of gaming applications unless they have been issued a positive determination of suitability by the Massachusetts Gaming Commission during the RFA-1 application process. Included among the main pre-conditions to filing an RFA-2 application is the requirement that the applicant must have filed its ENF and received a Certificate on the ENF from the Secretary of EEA. The Proponent filed its ENF for the Project on January 31, 2013 and received its Certificate on April 5, 2013. The Commission has established December 31, 2013 as the deadline for an applicant's RFA-2 application.

3.3.3 Host and Surrounding Community Agreements

Consistent with the Expanded Gaming Act requirements, the Proponent has negotiated HCAs with each of its host communities: Boston and Revere. Copies of these HCAs are provided in Attachment B. In addition, the Proponent continues to engage in negotiations with the surrounding communities of Chelsea and Winthrop, as well as other nearby communities.

3.4 Consistency with Planning

3.4.1 EO384, Sustainable Development Principles

The Project is consistent with and promotes Governor Patrick's Sustainable design principals as described below.

3.4.1.1 Concentrate Development and Mix Uses

Caesars Resort at Suffolk Downs consists of a redevelopment of existing site, structures, and infrastructure along with new construction. The site plan will create pedestrian-friendly connections to surrounding districts and neighborhoods. Both the restored and newly created recreational open space will provide a variety of activities for public use.

3.4.1.2 Advance Equity

The Proponent has worked with the communities and surrounding cities to ensure inclusive community planning and decision making that take into account the interests of future generations. Furthermore, pursuant to Chapter 23K, a portion of the taxes on the Resort's gross gaming revenue will be allocated to a community mitigation fund from which the Massachusetts Gaming Commission will allocate funds to the cities of Boston and Revere and others to address potential Project impacts.

3.4.1.3 Protect Land and Ecosystems

A regenerative approach to site design will restore and protect environmentally sensitive natural ecosystems and provide an additional 16 acres of open spaces and recreational opportunities.

3.4.1.4 Use Natural Resources Wisely

The cornerstone principle of the new development is based on conservation of natural resources by reducing waste and pollution through efficient use of land, energy, water, and materials.

3.4.1.5 Provide Transportation Choice

The Project has been designed to take advantage of its superior location and proximity to multiple transportation options, including Logan International Airport. The multi-mode transportation systems planned for the Resort include two Blue Line transit stops, taxi service, on-site shuttle bus, off-site ground transportation system, a potential on-site MBTA bus stop, and pedestrian and bike paths. The Proponent will also encourage shared-vehicle and shared-ride services for all employees. The City of Boston is planning to expand the Hubway bike-share program to include East Boston, and the Proponent has committed to install two Hubway stations (one near the Suffolk Downs MBTA Station and another near the entrance to Casino Area II) when the program is expanded.

3.4.1.6 Increase Promote Clean Energy

The Project will produce approximately 2.7 MW of "carbon free" on-site renewable energy through the use of PV arrays. The goal of this design is to maximize the amount of solar resource deployed without placing an undue annual financial burden on the Proponent with regards to cost of power from the solar PV system.

3.4.1.7 Increase Job and Business Opportunities

The Resort will bring significant new investment to the cities of Boston and Revere, increased governmental revenue, and new permanent employment opportunities as well as construction opportunities for residents of the host cities and other local communities. In addition to new jobs, public funding, and direct investment at Suffolk Downs, the Resort will promote small business and the tourism industry and will have positive economic effects on surrounding cities and the Commonwealth of Massachusetts.

3.4.1.8 Plan Regionally

Caesars Resort at Suffolk Downs is being planned to consider regional impacts and benefits.

3.4.2 East Boston Master Plan (April 2000)

The Project is consistent with the policy and planning objectives set forth by the City of Boston in the East Boston Master Plan (April 2000). Specifically, the Resort will promote the goals of supporting economic development in East Boston and increasing the quality and variety of employment opportunities for residents in and around the community. The Project will improve existing infrastructure, including transportation networks, and enhance access to and from the MBTA Blue Line Suffolk Downs Station. Bicycle and pedestrian access to the site will be accompanied by improved access to the Belle Isle Marsh as well as other local amenities. Due to careful site design, the Project will create additional pervious area in a location dominated by existing surface parking lots, and stormwater management will promote better water quality. Furthermore, the Project will preserve existing open spaces and create new open spaces for the public to enjoy.

3.4.3 City of Revere FY2010-2015 Strategic Plan

The Project is also consistent with the planning objectives set forth by the City of Revere in the City of Revere Strategic Plan, FY2010-2015. Specifically the Project will increase economic development and employment opportunities, one of the major objectives of the Strategic Plan. The Project will also provide funding to the City which will be available to fund infrastructure improvements, another objective in the Plan.

The Project will increase access to open space on site and will provide bicycle accommodations to enhance access to open spaces and beaches. On-street bicycle accommodations will connect Constitution Beach and Belle Isle Marsh with Revere Beach along the Bennington Street corridor, and will also establish connections to and through the Project site from the MBTA Suffolk Downs Station and from Winthrop Avenue. This network will establish access to a walkway in the Belle Isle Marsh that is being constructed as part of a separate project associated with a U.S. Environmental Protection Agency (EPA) consent decree and in accordance with a plan developed by the Friends of Belle Isle Marsh.

3.4.4 Boston Regional Metropolitan Planning Organization Journey to 2030

Journey to 2030 is the Metropolitan Planning Organization's current Transportation Plan. Project consistency with the plan is established by proposing growth near transit services, improving the streetscape, and supporting pedestrians and bicycle use, which will reduce single-occupant vehicle trips in the area. The Project will improve the pedestrian environment by providing new lighting, landscaping, and walkways, will improve access to and from Suffolk Downs Station, and will provide upgraded pedestrian and shuttle connections to the Resort. In addition, the Project includes on-street bicycle accommodations to connect Constitution Beach and Belle Isle Marsh with Revere Beach along the Bennington Street corridor, along with connections to and through the Project site from the Suffolk Downs Station and from Winthrop Avenue. This network will establish access to a walkway in the Belle Isle Marsh that is being constructed as part of a separate project associated with an EPA consent decree and in accordance with a plan developed by the Friends of Belle Isle Marsh.

Based on an analysis of the existing wastewater infrastructure and the estimated proposed sewer generation, the existing BWSC 12-inch gravity sewer line demonstrates adequate capacity to accept and convey the increase in flow from the proposed Resort. Furthermore, water capacity problems are not anticipated within the existing system as a result of Project construction.

3.5 Zoning

3.5.1 Revere

Within Revere, the Project site is located in an area designated in the City's Zoning Ordinances as PDD (Planned Development District) 1. Currently, the Project includes only racing and ancillary maintenance and parking uses within the City of Revere, which are permitted by right in the PDD1. Gaming facilities are permitted within the PDD1 by special permit. The Proponent will apply for the necessary special permit at the appropriate time.

3.5.2 Boston

Within Boston, the Project site is located in the Suffolk Downs EDA and the Suffolk Downs Special Study Overlay Area, both of which are contained within the East Boston Neighborhood Zoning District, which is governed by Article 53 of the Boston Zoning Code. The Proponent intends to comply with the relevant provisions of the Boston Zoning Code, including obtaining any applicable zoning approvals or zoning relief and undergoing project review to the extent required by the Boston Zoning Code for development of the Project. Dimensional requirements currently applicable to the Project site are set forth in Table L of Article 53, and preliminary zoning information for the Project is included in Table 3-2.

Table 3-2 Preliminary Zoning Information for the Project

	Preliminary Zoning Calculations for the Project
FAR	0.385
Building Height (ft.)	170
Lot Size (sq. ft.)	4,739,040
Lot Width (ft.)	approx. 3,250
Lot Frontage (ft.)	approx. 680
Front Yard (ft.)	approx. 30
Side Yard (ft.)	approx. 165
Rear Yard (ft.)	approx. 20

The Proponent anticipates that the Project will comply with all use and dimensional requirements applicable to the Project site with the exception of use and maximum height. Gaming uses are not currently permitted under the Boston Zoning Code. An amendment to the Boston Zoning Code for these purposes is contemplated.

Required off-street parking spaces and loading facilities for the Project will be determined through the Large Project Review process consistent with the requirements of Section 53-56 of the Boston Zoning Code.

As noted above, the Proponent will fully comply with the project review requirements of the BRA and will undergo Large Project Review in accordance with these requirements, including any design review of proposed buildings required pursuant to the BRA's development review guidelines. The Proponent will pay to the BRA any Development Impact Project Fees required under Article 80. At the completion of any required development review, the Proponent and the BRA will enter into a Cooperation Agreement pursuant to Article 80 in which the Proponent will commit to undertake such mitigation measures and such additional undertakings as are typically included in Cooperation Agreements for similar projects. The Proponent understands that any mitigation and other commitments that may be made by the Proponent in the HCA may also be incorporated by reference in the Cooperation Agreement for the Project.

3.6 Legal Information

3.6.1 Legal Judgments Adverse to the Proposed Project

The Proponent is not aware of any legal judgments that are adverse to the proposed Project.

3.6.2 History of Tax Arrears on Property Owned in Boston by Proponent

The Proponent has controlled the parcel for approximately 21 years, and there have been no tax arrears during this period.

3.6.3 Site Control and Public Easements

The Proponent owns fee title to the Project site. As discussed in further detail in Section 5.0, the Project includes certain off-site traffic improvements along Route 1A in East Boston, and the Proponent also plans to either design and construct or finance other off-site improvements along Revere Beach Parkway and elsewhere. The Proponent has already begun discussions with certain property owners who own property in the proposed Right of Way (ROW) of the Route 1A improvements and will continue to work with these property owners to obtain all rights required for the construction and ongoing maintenance of these improvements.

Once constructed, ownership of the improvements and the necessary rights in land on which the improvements have been made will be transferred to the owner of the roadway facility.

3.7 Coordination with Massachusetts Port Authority, MassDOT and the Federal Aviation Administration on Aviation Issues

The Project team has consulted with Massport senior aviation staff to review Project concepts in relation to airfield and airspace operations and identify potential impacts to aviators and the traveling public and has also discussed the Project with the Aeronautics Division of MassDOT. The design team, in close coordination with Massport engineers, is

presently working on an extensive solar glare study to avoid, minimize, and mitigate potential impacts resulting from the Project, including the proposed PV array. Massport has reviewed preliminary massing studies, and the Project has been designed with a goal to avoid creating any new hazard to air navigation by carefully selecting building height and location. The design and permitting teams will continue to coordinate with the FAA. Following FAA's guidance, the Project team anticipates filing Notices of Proposed Construction or Alteration (FAA Form 7460-1) for each building, crane, and PV array, as dictated by FAA regulations and ongoing guidance by FAA and Massport.

Section 4.0

Urban Design

4.0 URBAN DESIGN

This section describes the character of East Boston and Revere in terms of their history, land use, and important urban design goals as well as the Project's design response.

4.1 Existing Urban Context

The story of East Boston and Revere has a common beginning. Both communities were annexed to Boston in colonial times, were shaped over time by connecting harbor islands with landfill, and have a strong connection with the waterfront. However, that is where the similarities end, as over a span of two hundred years the cities have transformed along different paths.

4.1.1 East Boston

Urban life in East Boston began in 1833 when William Sumner and his business partners formed the East Boston Company. Soon after, the East Boston Company conceived an urban development plan for what was then known as Noodle Island. This established an urban street grid, squares for open space, piers, and a public garden. The street grid divided Noodle Island into three sections, known today as Jeffries Point, Central-Maverick Square, and Eagle Hill. The hilly terrain of Orient Heights prevented the strict grid-like plan from extending northeast (see Figure 4-1).

The East Boston Company shaped the development of East Boston for nearly one hundred years. Through the 19th century and into the 20th century, most of the East Boston waterfront was an active port, industrial center, and hub of clippership building. A ferry service also linked East Boston residents to an expanding metropolis across the harbor. The neighborhoods, which were originally planned as single family residences, changed over time as waves of immigrant workers increased the demand for multi-family housing.

During the early 20th century, advancements in transportation and the progression of Boston as an intellectual, political, and cultural center of the northeast shaped the modern urban history of East Boston. In 1905, the first under-sea subway tunnel opened connecting East Boston to the rest of the city. A small airfield was developed in 1923, eventually leading to commercial flights between Boston and New York and establishing East Boston as a gateway to the city. The Sumner Tunnel, another major transportation project, was constructed in 1934 allowing residents to travel freely to Boston via automobile. With the increase in transportation options and construction of Suffolk Downs in 1935, East Boston became a significant hub in Boston's rich sporting, cultural, and social fabric.

For decades, East Boston has maintained a unique identity. The character of the community echoes back to its urban roots and is largely described by its historic neighborhoods, with dense urban housing for a diverse population. Other principal land use functions that exist today include commercial corridors, maritime industrial, and, of course, thoroughbred

racing (see Figures 4-2 and 4-3). East Boston is also the home of Logan International Airport, which makes it a gateway to visitors from around the world. Over the past decade the residential character has been enhanced with the additions of new neighborhood commercial centers, the creation of new public open space, and renewed activity on and around the waterfront.

Several planning studies have been conducted over the past seven to ten years which focus on future development in East Boston. These studies provide an outline of the planning goals that are important to the neighborhoods, which include:

- reconnecting the neighborhoods to the waterfront;
- preserving and maintaining the historic character of the Eagle Hill, Maverick Square, Jefferies Point, and Orient Heights neighborhoods; and
- promoting connections to the East Boston Greenway and Bell Isle Marsh Reservation.

4.1.2 Revere

Revere was originally part of the Rumney Marsh settlement that was annexed to Boston during colonial times. The settlement was subdivided into Chelsea, North Chelsea, and Winthrop, and in 1871 North Chelsea was renamed Revere. During the late 19th century Revere came into prominence as a resort destination for the greater Boston area, with the main attraction being Revere Beach, America's first public beach. The popularity of the long crescent-shaped beach established Revere as the resort and entertainment destination of the northeast. Soon after Revere Beach opened, Wonderland Park – a new theme park – opened just a few hundred feet from the beach. While the park was only in existence for five years, its mark on the city is still evident today and the name carries on.

The Boston, Revere Beach, and Lynn Railroad played a major role in the rapid growth and development of Revere Beach as a summer resort. Streetcars placed visitors only a few hundred feet from the beach, which provided easy access to area attractions. For nearly seven decades, Revere Beach Boulevard was lined with the activity of hotels, dance pavilions, carousels, fine dining, movie theaters, roller coasters, fun houses, and all sorts of special entertainment activities.

Today, Revere is a diverse, densely-populated neighborhood with over 70% of its land devoted to residential uses. The city also has small pockets of industry and several neighborhood commercial corridors (see Figures 4-2 and 4-3). Residents of Revere enjoy access to tremendous natural and recreational assets, and a revitalized Revere Beach again attracts visitors to the City.

Several planning studies and economic initiatives have been developed over the past five years which are common in purpose and vision: to reestablish Revere Beach Boulevard as a gateway to beach. Currently, Revere is in the early phases of a four-phase redevelopment of Revere Beach Boulevard. The project, Waterfront Square, promises 1.3 million square feet of new construction with a mix of uses including luxury hotel, housing, office, retail, restaurants, and entertainment venues. The Waterfront Square development embodies the following urban design principles which are key to the city:

- improve pedestrian access to the waterfront, particularly from the MBTA stations;
- encourage mixed-use developments;
- provide active ground floor uses to enliven the pedestrian realm; and
- create a mixed-use pedestrian boardwalk/promenade along significant sections of the beachfront.

4.2 Defining the Urban Resort Casino

The common perception of resort casinos is based on the themed mega-resort complexes of Las Vegas, with their immense, sprawling, windowless podiums and soaring hotel towers containing thousands of guestrooms. Mega-resort casinos are typically inward-oriented, cities unto themselves, and not linked to their metropolitan hosts since guests are encouraged to check-in and never leave the footprint of the resort.

The ambition for Caesars Resort at Suffolk Downs is nothing short of redefining the paradigm of resort casino developments. By design, Caesars Resort at Suffolk Downs is an outward-oriented urban resort casino, meaning that the development will be integrated, not physically but in a business sense, with the pre-existing business community, restaurants, shops, hotels, and attractions in the Boston and Revere metropolitan areas. This distinction is important, as the urban resort casino philosophy intentionally limits the scope and intensity of development and tailors the Project's program to its urban context. Low-intensity development, a commitment to sustainability, and a forward-thinking regenerative approach to site development will set Caesars Resort at Suffolk Downs apart as a world class urban resort casino. Furthermore, Caesars Resort at Suffolk Downs will be a leading example of responsible site development in environmentally sensitive areas.

4.3 Building Design

The proposal is a redevelopment of the 161-acre Project site with a series of buildings for a diversity of uses and organized by a street grid. The Project program is described in Section 1.1.1.

4.3.1 Urban Design Principles

The design of the Project embodies several key urban design goals specific to East Boston, Revere, and the Project site, which include:

- limiting development intensity through an outward-oriented approach that markets the cities of Boston and Revere and their attractions;
- establishing a hierarchy of street, open space, and building;
- fostering a regenerative approach to the site and landscape design that embraces the ecological history of the site;
- using a regenerative approach to site development to restore a marsh-like ecological landscape that will serve as green infrastructure;
- embracing the history of the neighborhoods while creating a new identity for the district's revitalization;
- increasing connectivity of the district with improved pedestrian, bicycle, and vehicular access into, through, and around the site; and
- creating a diversity of new urban open spaces.

4.3.2 Massing, Form and Response to Urban Context

The master plan, shown in Figure 1-6, establishes the primary spatial hierarchy of street, open space, and building. Tomasello Drive, the main circulation spine for vehicles, pedestrians, and bicycles, winds through the site connecting the entrances from both Route 1A and Winthrop Avenue. A street pattern grid organizes the site into blocks, arrival courts, and plazas, creating an urban streetscape. The blocks establish a series of buildings beginning with Hotel I, Casino Area II, Hotel II, a winter garden connecting Casino Areas I and II (in the renovated grandstand and clubhouse), and a parking structure.

The infusion of an urban street grid is just one of several key factors that contribute to the Project's form and massing. Limiting development intensity through an outward-oriented approach and repurposing the historic grandstand building as a casino are also central to the overall massing and organization of the Project program.

4.3.2.1 Hotel I and Hotel II

In keeping with the philosophy of an outward-oriented development, the hotel program for Project is set at a modest 450 guestrooms, which is 70% less than typical resort casino developments. In response to the scale of the historic neighborhood context, the critical surface elevations of nearby Logan Airport, and to provide diversity, Hotel I will contain 300 guestrooms and Hotel II will contain 150 guestrooms.

When considering the massing of Hotel I, the initial concept was to reduce the scale and articulate the form with a language appropriate for its urban context, while maintaining a relationship to its legacy property of Caesars' original property in Las Vegas. The nine-story Hotel I will be approximately 130 feet tall and will face east/west, offering the narrowest profile to the Orient Heights neighborhood while providing the opportunity for the form to be self-shading from early morning to late evening. The scale of the massing will be further articulated with a modern tripartite organization of base, body, and top.

The 12-story Hotel II, approximately 170 feet tall, will be the taller of the two hotels and is sited away from the Orient Heights neighborhood. Hotel II is envisioned as a focal point along the southern edge of the North Plaza. Hotel II may be developed by the Proponent or a third-party hotel developer in the future. Thus, the design of Hotel II depicted within this submission is only one representation of the future project. Diversity in architectural design is an important consideration in the overall composition of the Project; therefore, the intent of this document is to generally describe the massing of the building in terms of building height and density.

4.3.2.2 Casino Area I and Casino Area II

The approximately 220,000 square feet of gaming/casino area will be split equally among two casino floors: Casino Area I and Casino Area II. Splitting the gaming/casino program into two separate casino floors has some important benefits to the Project design. The arrangement of the two casino buildings promotes the creation of open spaces and plazas between the buildings, and the reduction in casino floor depth and additional building perimeter pull active uses to the exterior. The outward expression of restaurants and active uses will contribute to vibrant pedestrian plazas and streetscapes.

Casino Area I will be on the ground floor of the renovated grandstand and clubhouse buildings, which were originally built in 1935. The west elevation of the existing grandstand structure consists of a 630-foot-long, two-story massing which steps back to the upper grandstand. Originally an open-air grandstand, in 1962 the grandstand was renovated and enclosed with windows. In 1979, the grandstand's west façade was covered over with a blank stucco wall. The design for the renovated façade recalls the previous design by incorporating a significant amount of new windows along with elements such as

an entry porte cochere, restaurant facade, and the winter garden to break up the massing. A two-story CUP addition is planned just north of Casino Area I. The massing of the CUP will be lower than and set back from the massing of the grandstand.

Casino Area II will be a two-story podium linking the bases of the two hotels. The second story of the massing will step back along the eastern edge to a scale more complementary to the existing grandstand and clubhouse buildings, and will be shielded from the Orient Heights neighborhood by the crescent form of Hotel I.

4.3.2.3 Parking Structure

The parking garage will be a seven-level standalone structure, approximately 60 feet tall, with one level of below-grade parking and six levels of above-grade parking. The open-air parking structure will be located away from the Orient Heights neighborhood and will provide approximately 2,550 self-park spaces.

4.3.3 Façade Design Fenestration and Building Materials

4.3.3.1 Hotel I

As described above and illustrated in Figure 1-8, the façade of Hotel I will be articulated as base, body, and top. The façade design features a contemporary expression of 21st century hotel design that is intended to enrich and complement the character of the surrounding neighborhoods while reinforcing the Caesars brand. The base of the hotel will be lined with active uses including restaurants and lobbies, providing abundant transparency to make the building engaging to pedestrians. Base materials will consist of course limestone walls and piers, metal and glass storefront openings, and a metal and glass porte cochere structure. The glass storefront openings will include operable doors to allow restaurants to spill out onto sidewalks and adjacent patio spaces, thus creating a vibrantly scaled and lively public realm adjacent to the main entry lobbies.

The second floor will be recessed, allowing the perimeter structure, clad in metal, to be revealed. Floor-to-ceiling glazing and generous balconies to the north and south will provide further separation of the base from the body of the hotel.

A high-performance glass curtainwall will form the main body of the hotel, and will be scaled using a two-story framework of horizontal and vertical mullions. Within the framework, the curtainwall will emphasize a vertical proportion. Operable windows will be incorporated, adding a subtle pattern and a finer grain.

A cantilevered roof form will float above the top floor of the building, and again the floor-to-ceiling glazing will be pulled back to allow the structure to articulate itself and to provide balconies at both ends of the crescent.

4.3.3.2 Casino Area I and Casino Area II

The existing clubhouse and grandstand buildings, constructed in 1935, will undergo complete renovations and will house Casino Area I on the first floors. The west facade of the existing grandstand building will be completely reconstructed in a design sympathetic to the 1930s deco-style facades that have been retained at the clubhouse and southern portion of grandstand. The new design for the facade, as seen in Figures 1-10, 1-20, and 1-21, will be organized along the grandstand's 25-foot-wide column bay that is marked by a constant rhythm of pilasters that provide a vertical counterpoint to the grandstand's horizontality. Expressed mullion covers will subdivide each 25-foot bay into two smaller window bays. Tower elements will be used to further modulate the façade, creating a secondary rhythm of vertical elements to further break down its 630-foot length. Two larger towers will flank a three-bay section of the façade that will step up to announce the main entrance to Casino Area I. Consistent with the retained historic portions of the building, the wall, tower, and pilasters surfaces will be finished in stucco. A finer layer of detail will be introduced with a series of band courses and inset relief panel treatments to articulate the façade's primary architectural elements and to further break down and give a human scale to the façade's considerable length.

Along its length, the west façade of Casino Area I will feature three interventions. A porte cochere at the main entry is designed to clearly read as a latter day addition to the building and speak to its new use. Its exposed-steel aesthetic is based on expressing the structural elements from which it is composed. Mid-way down the façade, a one-story retail bay (marking the location of a third-party restaurant) will assert its own unique stylistic expression. Further south, the winter garden is designed as a glassy pavilion linking Casino Area I and Casino Area II. Collectively, these three additions will describe the historical layering of the 78-year-old grandstand.

The façade of Casino Area II will be articulated by using separate forms and materials with large glazed openings to provide a scaled and responsive set of individual buildings tied together by horizontal datum bands. This approach will provide flexibility to respond to context, site, orientation, and function in a meaningful way. The buildings that encompass Casino Area II will be defined by pulling forward and articulating the exterior walls of individual elements such as restaurants, bars, and club rooms. A granite base will form a horizontal datum linking the Hotel I base to the podium.

Along the north façade, a strong articulated form of buff-colored fiber cement rain-screen will emerge with a large glazed double-height entry point framing views into and out of the heart of the casino floor. A glass and steel bridge will span from the parking garage to where it will be received by the second floor of the entry lobby leading to the casino floor (see Figure 1-26).

A recessed metal band set 12 feet above the floor will provide a mid-base datum, organizing doors and windows along the façade. Further along the façade, the podium form will be recessed at the North Plaza, awaiting insertion of Hotel II. This façade will change color, articulation, and scale. A large two-story glazed opening will provide fenestration and will be the future connection to the Hotel II lobby.

A glazed winter garden will link Casino Area I and II across a north/south street running parallel to the grandstand. The structure will be built in the grand tradition of the great glasshouses and glazed courtyards. Housed inside will be a tourism welcoming center functioning as a gateway to all that Boston has to offer. Natural light will filter through clear and translucent glazing to create a serene transition from Casino Areas I and II as well as from the north to the plaza.

Adjacent to the winter garden, a second buff-colored fiber cement building will form the east façade of Casino Area II. This building, as seen in Figure 1-28, will be informed by the scale and proportion of the clubhouse façade opposite and will have modulated glassed openings 18 feet high, forming a second horizontal datum around these buildings. With clerestory glass, canopies, and a series of doors leading to outdoor terraces, an engaging streetscape of dining and social activities in the South Plaza will be formed by the west clubhouse façade and eastern casino building.

A recessed secondary building will form a connective tissue. Clad in a lighter-colored and finer-grained architectural metal wall panel, it will turn the corner and meet the casino's southern building. The major architectural elements of framed openings organized around a structural bay of 30 feet will be further scaled by vertical mullions running up to the recessed metal datum band. Clerestory glazing above will provide daylight deep into a series of VIP and specialized gaming rooms. Canopies will shelter activities spilling out onto landscaped terraces. Awnings will create a finer pedestrian scale, encouraging pedestrian engagement and activity.

These buildings will collectively promote active and animated facades and will form an urban and diverse series of streetscapes punctuated with engaging views into and out the casino floor, surrounding lounges, restaurants and other areas. Together this unified composition of streets and plazas populated by individually articulated buildings will work together to form an urban and pedestrian-friendly resort.

4.3.3.3 Parking Structure

The exterior design of the precast concrete parking structure is comprised of an offset array of gunmetal-colored panels mounted within a white metal grid which will group floors vertically and will reveal the precast structure and horizontal steel cable barriers beyond. The density of the vertical panels is intentionally designed to provide a sense of enclosure,

making the garage more building-like to enrich and complement the character of its urban setting, which will front the North Plaza. The base of the east elevation has been designed to accommodate future retail to help enliven the plaza.

The top of the garage will be outfitted with a PV canopy that will be part of the approximately 2.7-MW solar array system deployed on-site. The PV canopy will be supported by a thin steel structure integrated into the building design (see Figure 1-31).

4.4 Site Design and Open Space

The Project's landscape design embraces the site history, its unique location between the waterfronts of East Boston, Revere, and Chelsea, and its transformation over the last 100 years into an active racetrack and clubhouse. In fostering a regenerative approach to the site and landscape design, the Resort connects nature, people, and place. The Project's site design will accomplish the following goals:

- **Understand the land and history, and embrace the unique location:** The Project embraces the site's unique location, nestled between the waterfronts of East Boston and Revere. By improving ecological conditions and maintaining the racing program, the Project acknowledges the site history of transformation from marshes, creeks, and islands into the racetrack over the last 100 years. Figure 4-4 provides historic maps for context.

- **Restore landscape ecology:** The proposed landscape design will remove acres of deteriorating asphalt on the Project site and restore a marsh-like ecological landscape that will serve as green infrastructure, creating diverse public spaces and providing an educational amenity to the neighborhood and visitors. The proposed design will reduce existing impervious pavement by approximately 14 acres and will add approximately 16 acres of open space relative to existing conditions (see Figures 4-5 and 4-6, Existing Impervious Area and Site Plan).

- **Provide diverse types of open spaces:** The Project design promotes diverse open spaces that range from active pedestrian spaces and vibrant streetscapes to passive ecological areas with walking trails and viewing areas for the public. Specific open spaces are described in further detail in Section 4.4.

- **Connect neighborhoods and ecosystems:** A network of public pedestrian walkways and bikeways will connect surrounding neighborhoods to the Project site. The proximity of the East Boston Greenway and trails of the Belle Isle Marsh offer the opportunity to connect the Project site to the greater East Boston network of public open spaces. Figures 4-7 and 4-8, Boston Greenway Context and Local Greenway Context illustrate the greater context of the Project site.

- **Develop innovative green infrastructure and pursue sustainable systems:** The Project design utilizes the landscape to purify and infiltrate stormwater, rehabilitate poor soils, and create a special and distinct environment. It also provides opportunities for environmental education with interpretive signage along pathways to describe the ecological restoration on-site. Off-site infrastructure will be designed with the latest sustainable technologies in mind. Local schools may use the site to explore marsh ecology and ecological restoration (see Figure 4-9, Entry Road Landscape).

- **Be innovative and sustainable:** The Project landscape will not only embrace the beauty of native plants, but will also have low maintenance and irrigation needs.

- **Make parking attractive and functional:** The parking lot design will improve the visitor experience with shaded walkways and connections to the buildings. Bio-swales are proposed to treat stormwater run-off. Portions of the surface parking will be covered by the proposed PV array.

- **Be responsive to sea level rise:** The Project design responds to the real concern of future sea level rise by elevating buildings, roadways, and access points to create a safe haven for the community (see Section 2.3 for a detailed discussion of climate change and adaptation). Figures 2-2 and 2-3 show Existing Topography and Proposed Topography.

- **Community Connectivity:** Pedestrian connections on the site also offer the opportunity for future connection to the East Boston Greenway, amplifying the amount of public open space available to the community.

The Project design includes a number of public open spaces to activate the site and to offer unique programming opportunities and outdoor leisure. Proposed open spaces are shown on Figure 1-38.

4.4.1 Entry Landscape

The Entry Landscape as envisioned will encompass an approximately 27-acre area along Tomasello Drive that will set the tone for the Resort for visitors entering from Route 1A (see Figure 4-10, Entry Drive Detail Plan). The open space will be comprised of pathways meandering through native marsh-like vegetation that will filter stormwater before it leaves the site. Pathways will peel away from the road to provide a more enjoyable pedestrian experience. Low-energy lighting with reflectors to minimize light pollution as well as site furnishings along the path will enhance the pedestrian experience. Views of the Entry Landscape from the road are designed to create a memorable visitor experience that changes through the seasons and through the years.

4.4.2 Entry Court

The Entry Court will be a 1.9-acre plaza at the main entry to Casino Area II that will include a drop-off area at the Port Cochere for valet, taxis, shuttles, and bicycles (see Figure 4-11). Plaza materials will be a mixture of high-quality hardscape and permeable pavers to create an elegant surface while allowing stormwater infiltration. A water feature will create a memorable arrival experience and focal point for the Resort, but use of potable water will be minimized. Seating areas will be provided within the plaza.

4.4.3 South Plaza

The South Plaza will be a 0.9-acre space at the entry to Casino Areas I and II from the South Parking Lot (see Figure 4-12). It will include areas paved with pervious pavers that will create an attractive surface at the building entry. Native plantings will also provide visual interest and shade to cool the environment. Outdoor café seating will extend from the Resort's restaurants onto the plaza, creating a space that will be active and vibrant day and night.

4.4.4 North Plaza

The North Plaza will be a 2.2-acre area flanked by Casino Area I, Casino Area II, and the proposed parking garage (see Figures 4-13 and 1-10). This plaza will include paved areas open to limited vehicular access serving the Casino Area I Port Cochere; these paved areas will be created with a combination of elegantly designed hardscape and permeable pavers. Large green areas at the center of the plaza will create a cool oasis for informal gatherings and planned events, and lines of trees at the plaza's edges will provide shade for pedestrians. The space will be programmed for outdoor events, festivals, and live entertainment. Portions of the plaza may be closed off to vehicles for dedicated pedestrian use during outdoor events.

4.4.5 Apron and Track Viewing Landscape

The apron and track viewing landscape will be an approximately 3-acre landscape stepping down from Casino Area I and the grandstand to the edge of the racetrack (see Figure 4-14). A hardscape terrace will extend approximately 20 feet from the building for expansive views. From there, a softer landscape will be introduced, with green seating terraces to the south, a paddock at the center for parading horses, and a relatively flat green landscape to the north for large tents and a viewing area. A continuous pedestrian path will allow controlled access along the racetrack and paddock. Plantings at the edges of the apron will provide shade for informal seating areas and the playground.

4.4.6 Racetrack Infield

The racetrack infield is an approximately 33-acre green space surrounded by the racetrack. The Project will maintain the horse racing program at Suffolk Downs, and there will be no specific change in use of the racetrack infield. Similar to past use by Suffolk Downs, the Proponent anticipates using the infield for special events and public gatherings such as concerts, festivals, and other community events.

4.4.7 Walkways and Pedestrian Connections

A network of public pedestrian walkways and bikeways will connect the Resort with surrounding neighborhoods, and the proposed entry paths will create a unique arrival sequence and visitor experience by embracing the marsh-like setting and establishing a Project site landscape that is outwardly-focused. Sidewalks will encompass approximately 2.75 acres of the Project site, and pedestrian circulation is shown on Figure 1-35. All pedestrian areas and pathways are designed to support universal access, and are sized to appropriately accommodate the anticipated volume of users. Site furnishings (e.g., benches) along pathways will support pedestrian comfort, and pedestrian areas will be well-lit with high-quality lighting fixtures chosen to ensure safety, be energy-efficient, and minimize light pollution. All streetscapes on the site are being designed in compliance with Boston Complete Streets standards. Sidewalks and bikeways along roadways are designed in smooth materials to comply with ADA regulations.

Attractive, shaded multi-use pathways for bikes and pedestrians will move along Tomasello Drive and Blue Line Road, providing connectivity to the Project site from neighborhoods and the Suffolk Downs MBTA Station. At the southern edge of the site, a pedestrian path will provide access from the Orient Heights neighborhood to the Resort and Tomasello Drive.

The site's proximity to the East Boston Greenway and trails of Belle Isle Marsh offers the opportunity to connect into the greater East Boston network of public open spaces. In conjunction with deployment of the East Boston Hubway network, the Proponent will install two Hubway stations along the pathway near the Suffolk Downs MBTA Station and near the entrance to Casino Area II to promote bike access to the site and its surroundings. Bicycle circulation is shown on Figure 1-36 and Pedestrian Circulation is shown on Figure 1-35.

4.4.8 Winthrop Avenue Improvements

An enhanced landscape along Winthrop Avenue in Revere will improve the connection to the Beachmont MBTA Station and will serve as another main entry to the Resort. This landscape will include a generous eight-foot-wide path, an attractive new fence, and native plantings and trees to provide shade and visual interest along the neighborhood edge (see Figure 1-37). As described in Section 5.6.2, traffic and pedestrian safety improvements will

be implemented in Donnelly Square, which will incorporate streetscape improvements to the east of Beachmont Station. In addition, pedestrian accommodations at the Tomasello Drive intersection will be significantly improved with introduction of concurrent pedestrian phasing and the provision of a new "missing" crosswalk on Winthrop Avenue east of Tomasello Drive (see Figure 1-37, Winthrop Avenue Section).

4.4.9 Existing Surface Parking Lots

The site plan proposes to convert a substantial amount of existing impervious pavement currently used for parking into open space. The proposed surface parking areas (cumulatively approximately 2,000 parking spaces, see Table 1-2) will be defined with trees to reduce the heat island effect as well as shaded walkways to the public spaces and Resort buildings. A portion of the surface parking will be covered by the proposed PV array. The Project will introduce a series of planted bioswales along the parking areas to collect, filter, and slow stormwater. Walking paths through parking lots are being designed to keep pedestrians safe, comfortable, and separated from moving vehicles.

4.5 Sustainability and Green Infrastructure

Stormwater infiltration landscapes are designed not only to improve environmental quality, but also to serve as visual and passive recreational amenities for visitors.

Stormwater will be filtered through carefully selected native vegetation in a two-step treatment process. First, it will reach the lined pre-treatment area where 40% of total suspended solids (TSS) will be removed; second, stormwater will flow into a bio-infiltration area where more than 80% of TSS will be removed. The treated stormwater will then be allowed to infiltrate into the ground to recharge groundwater or enter adjacent wetlands. Stormwater management is described further in Section 9.3. Figure 4-15 illustrates the entryway plantings, and Figures 4-16 and 4-17 show planned improvements from sustainable design and plantings.

Permeable paving will be used in areas of the site with elevations high enough to allow proper drainage and infiltration. Resort plazas will include permeable paving to improve groundwater recharge and reduce site runoff (see Figures 4-18 and 4-19, Existing Condition Drainage and Proposed Condition Drainage).

Low-energy pedestrian lighting fixtures that minimize light pollution are proposed along pedestrian paths to enhance the pedestrian experience.

4.6 Plant Selection

Native and adaptive plant selections for landscaped areas will help reduce the urban heat island effect, provide visual interest in all seasons, and offer the opportunity for environmental education in the landscape. Using native and adaptive plant species will also help minimize the need for site-wide irrigation. Irrigation will instead be focused only

around the more manicured spaces immediately adjacent to the casino areas. In these locations, stormwater collected from building roofs into three large rainwater harvesting tanks will be used to meet irrigation demands. To minimize water use, the irrigation system will be equipped with timers, soil moisture indicators, and rainfall sensors. The Entry Landscape and other areas outside the designed spaces surrounding the casinos will be landscaped with plants selected to filter stormwater and will not require irrigation. A maintenance plan minimizing the use of chemical fertilizers will be applied to the site.

Section 5.0

Transportation

5.0 TRANSPORTATION

This section describes the multi-modal transportation characteristics of the proposed Caesars Resort at Suffolk Downs, including evaluations of existing conditions and projected future conditions without and with the proposed Project (i.e., No-Build and Build conditions, respectively). A range of associated transportation improvements and mitigation measures are identified to address existing local and regional transportation problems in the area in addition to minimizing potential negative impacts of the Project. These include physical multi-modal transportation infrastructure improvements and strategies as well as a robust TDM plan designed to reduce single-occupant vehicle (SOV) travel and encourage use of alternative transportation modes by patrons and employees.

The Proponent has committed to these improvements through the execution of separate HCAs with both the City of Boston and the City of Revere. The proposed transportation plan for the Resort will go far beyond mitigating potential traffic impacts of the Project, and will address long-standing issues of local and regional concern.

5.1 Introduction

VHB was retained by Sterling Suffolk Racecourse LLC (the Proponent) in 2009 to study the access needs and potential impacts of a resort casino project at Suffolk Downs and to identify existing local and regional transportation issues. VHB performed a preliminary analysis of the transportation needs and impacts of a resort gaming project including approximately 3,000 slot machines and 60 gaming tables along with supporting hotels, restaurants, bars, retail, and entertainment facilities. The study also identified specific existing local and regional traffic problems on the study area roadway network and developed infrastructure improvement concepts that would address existing traffic and safety problems as well as mitigate potential Project impacts and provide satisfactory access for the Project site.

Among other key findings, the 2009 study confirmed substantial existing peak period congestion and delay at the Boardman Street intersection on Route 1A as well as inadequate capacity and safety of the existing site access on Route 1A at Tomasello Drive. Indeed, the overriding concern expressed by community representatives from the time Project representatives began discussing the Project with the public was the need to address traffic backups at the Boardman Street/Route 1A intersection. Plans for a flyover at this location to assist Route 1A motorists entering and exiting Boardman Street in both directions have been discussed in various forums for the better part of three decades. For many reasons, the project has not been realized. Time and again, nearby residents explained to Resort representatives that the traffic situation was such an issue that a police detail has been assigned to the interchange during extended peak periods on a regular basis. In many ways, the detail has become a symbol of problems with the intersection and has been, far and away, the number one transportation issue expressed by the community during the extensive public participation process the Proponent has undertaken.

The flyover concept was officially developed as one of the post Central Artery/Tunnel (CA/T) projects aimed at regional mobility. Over the years, support for the concept was strong enough that the flyover was included in the "Journey to 2030" transportation plan of the Boston Region Metropolitan Planning Organization (MPO), was a recommendation of the Congestion Management Systems Report published by CTPS in 2004, was on the list added to the MPO's long range Transportation Improvement Program (TIP), and was in line for state funding. It was removed from the TIP in 2009 as the Commonwealth's transportation resources became more constrained and priorities were adjusted. Despite being removed from the TIP, the issues to be addressed at Boardman Street and Route 1A have not gone away.

In response to this issue and other community concerns about local access and potential impacts from Resort-related traffic to the neighborhoods, a preliminary improvement concept to address these issues was developed. The concept, referred to as the Boardman Street flyover solution, has been widely presented publicly and advocated for by the Proponent, recognizing that it is a concept subject to subsequent discussion with, and approval by, MassDOT and BTD.

The original study area (as presented in the ENF) included 20 intersections over a wide area to capture both local and regional traffic data. New traffic counts were performed at all locations where then-current data were not available. This program included Friday evening peak and Saturday afternoon peak period turning movement counts (TMCs) at study intersections and automatic traffic recorder (ATR) counts over a seven-day week at key locations.

In response to the EEA Secretary's Certificate on the ENF, comment letters on the ENF, and as requested through discussions with MassDOT, BTD, and the City of Revere, additional TMCs and ATRs were performed to provide a consistent set of 2010 base-line data. The number of study intersections was expanded to include a total of 28 intersections, and additional TMC and ATR counts were performed in late 2012 and early 2013.

In addition, MassDOT asked that a range of alternatives for the Route 1A corridor through the Boardman Street area be explored. The concept for the flyover solution as presented in the ENF and advocated for publicly by the Proponent comprises a Route 1A northbound flyover at Boardman Street, an additional Route 1A southbound lane, traffic signal control at Waldemar Avenue, and signalization of the Tomasello Drive intersection. This is referred to as "Option 4" in this DEIR/EPNF. At MassDOT's specific request, several alternatives have been considered and are presented in this document for the purpose of conducting an alternatives analysis. Although all of the analyses presented in the DEIR/EPNF are anchored on Option 4, the overall study-area traffic impact analysis for the Project remains the same under any of the Route 1A Infrastructure Improvement options considered here except, of course, within the specifics of each Route 1A option.

5.1.1 Project Overview

The Project is described in detail in Sections 1.1 and 4.4. In brief, Caesars Resort at Suffolk Downs is a redevelopment proposed on approximately 161 acres of land that will contain two distinct gaming areas (referred to as "Casino Area I" and "Casino Area II"), two hotels with up to 450 rooms, a multi-purpose meeting/entertainment space, parking, restaurants including fine dining and bars, and retail space while maintaining and enhancing the existing horse racing facilities. Specific Project elements are described in detail in Sections 1.1.1 and 4.3.

In addition, the Project includes major off-site roadway, traffic, and safety improvements. More specifically, as part of the Project, major new roadway infrastructure will be constructed on Route 1A in the vicinity of the site. As requested by MassDOT, an analysis of alternatives for the Route 1A improvements was performed and is presented in Section 5.5. The proposed concept presented in this DEIR/EPNF (and ENF), and advocated for publicly (referred to as Option 4 in the Route 1A Alternatives analysis) would deliver to the community the grade separation at Boardman Street that has been sought-after for many years. In doing so, it would address existing local and regional traffic issues at Boardman Street, improve safety, and provide ample capacity to accommodate Project trips entering and exiting the Project site. As described in Section 5.5, the other Route 1A options that have been developed are intended to accomplish these same objectives.

The Proponent has committed to a substantial number of traffic and roadway improvements under the City of Boston and the City of Revere HCAs (many of which do not relate to Project impacts or regional traffic conditions). The HCA transportation commitments are described in Section 5.6. In addition to TDM commitments and improvements for alternative modes of transportation, the commitments include local and regional traffic/roadway safety as well as operational and capacity enhancements at many locations, some of which address pre-existing issues that are not expected to be significantly worsened by the Project. All improvements will be subject to coordination with the appropriate state and city agencies.

As part of the discussions for the HCAs and Surrounding Community Agreements, the cities of Revere and Chelsea asked that existing regional traffic issues along the Route 60 and Route 1 corridors be addressed. The HCA commitments include alternatives for new ramp connections at the Route 1/Route 16 interchange and improvements along the Revere Beach Parkway corridor, which, consistent with the Boston Metropolitan Planning Organization (Boston MPO)'s Lower North Shore Transportation Improvement Study (prepared by the Central Transportation Planning Staff for the Massachusetts Highway Department in October 2000), would shift some regional traffic from the Route 60 and Route 107 (Broadway) corridors to Route 1/Route 16. Such strategic new connections will address long-standing regional traffic and safety issues in the Cities of Revere and Chelsea along the Route 60 corridor through Butler Circle and Bell Circle, as well as along Route 16/Revere Beach Parkway between Webster Avenue and the split to Route 145. Indeed,

the Route 16WB to Route 1NB and Route 1SB to Route 16EB connections that are being pursued as a part of the Proponent's HCA and Surrounding Community Agreement commitments were also (in addition to a flyover at Boardman Street) a part of CTPS's recommendation in its 2004 Congestion Management System Report.

These improvements are on state-controlled roadways (MassDOT and the Department of Conservation and Recreation, DCR). While they offer improvements from which the Project will benefit, the improvements are intended to address pre-existing regional traffic problems, independent of the proposed Project and are expected to realize benefits for regional traffic that significantly exceed the potential impacts of Project traffic.

5.1.2 Study Scope

MassDOT has requested that the DEIR/EPNF transportation analysis for the Project be performed for the year 2022 (and that subsequent analysis for infrastructure design should be based on year 2032). The DEIR/EPNF transportation analysis for the Project considers four scenarios, as follows:

1. 2012 Existing conditions, based on latest traffic counts at study area locations and inventory of the existing transportation infrastructure;
2. 2022 No-Build future conditions, with associated traffic growth but assuming that the Project is not built;
3. 2022 Build future conditions, with the Project complete and operational overlaid on No-Build future conditions; and
4. 2022 Build with HCA (Host Community Agreement) Improvements (where appropriate).

The study area and study intersection locations are presented in Figure 5-1, and are described in Section 5.2.6.

In addition to the roadway and traffic analysis, the study also evaluates parking demand, transit, bicycle, and pedestrian access, and identifies the robust TDM program and strategies to be implemented by the Proponent.

5.1.3 Key Findings and Project Benefits

Key findings of the transportation analysis presented in the following sections include the following:

5.1.3.1 Existing Transportation Conditions

1. The Project site is very well located in relation to the Interstate and regional roadway systems and enjoys direct connections via Route 1A and the Ted Williams Tunnel to I-93 North, I-93 South (Southeast Expressway), and I-90 West, as well as to and from Downtown Boston and I-93 via the Sumner and Callahan Tunnels.

2. The traffic analysis confirms significant existing regional congestion in the Route 1A corridor, and continuing north on Route 60 through Revere to Route 1. Difficulties on Route 60 are exacerbated by lack of complete direct connections between Route 1 and Route 16 (Revere Beach Parkway), and by congestion on Route 1 at Copeland Circle and beyond.

3. Existing regional traffic congestion impacts local access for East Boston and Winthrop, particularly at Boardman Street.

4. The Project site is served by three vehicular access points, but the regional traffic congestion impacts local access to the Project site especially on Route 1A.

5. Regional and local traffic congestion is expected to prevail in the foreseeable future in the absence of any specifically programmed and funded major transportation infrastructure improvements. No such improvements are currently programmed in the TIP, and none are expected in the near future.

6. The Project site is well served by public transportation and benefits from MBTA Blue line service at the abutting Suffolk Downs Station, as well as local and express bus routes within one-quarter mile of the site.

7. Sidewalks are provided on the majority of the study area roadways, but the physical condition of sidewalks and ADA compliance is deficient in several locations, and inadequate pedestrian crossing accommodations are provided at many locations.

8. The existing bicycle infrastructure in the immediate vicinity of the Project site is limited, although significant bicycle improvements have been made, particularly in the East Boston neighborhoods.

5.1.3.2 Project Travel Characteristics and Trip Generation

1. Consistent with what has been observed in other gaming locations, it is expected that Project trip generation will be spread over the 24-hour day, and throughout the 7-day week, with approximately 55% of weekly gaming activity occurring on Friday, Saturday and Sunday combined.

2. The Project is expected to generate very limited trips during the morning commuter period. Peak Project traffic generation will occur after the evening peak commuter period during the week and after the afternoon peak on Saturdays. Therefore, the existing commuter peak periods do not coincide with peak Project trip generation.

3. As a result of the regional highway connections, nearly 70% of Project patron trips are expected to arrive from Route 1A south of Suffolk Downs. Very limited use of the Bennington Street corridor and neighborhood streets by Project traffic is expected.

4. It is expected that approximately 11% of patrons will use public transit and 5% of patrons will use high-occupancy vehicles (private coaches or shuttle buses). Thirty (30%) percent of employees are expected to commute by transit and 7% by bicycle or walking. While the Proponent will encourage water transportation to the site and is supportive of the City's plans to strengthen water transportation options to East Boston, it is not expected that a measureable number of patrons or employees will travel to the site by water.

5.1.3.3 Potential Traffic and Transit Impacts

1. The Route 1A infrastructure improvements will yield significant positive impacts to traffic operations and capacity compared to No-Build conditions throughout the day, even during peak occupancy of the Project.

2. The detailed traffic operations analysis shows limited degradation in overall LOS grades at study area intersections during critical peak periods due to Project impacts.

3. Capacity and operational improvements accrue as the result of the proposed roadway improvements, generally providing positive impacts compared to No-Build conditions and, at many locations, existing conditions.

4. Significant new ridership on the MBTA system will be generated by the Project, largely on the Blue Line as a collector from the rest of the MBTA system.

5. While use of the Suffolk Downs Station will increase substantially as a result of the project, such increase is well within the capacity of this extremely under-utilized station, the most underutilized station on the Blue Line.

6. Relatively limited volumes of Project trips using other Blue Line stations in East Boston are projected, with no significant impact anticipated.

7. Currently, the MBTA Blue Line has excess available capacity throughout most of the day, especially on weekends.

8. Blue Line ridership at the peak loadpoint (between Maverick and Aquarium Stations) is projected to meet or exceed available capacity during the weekday 8:00 AM to 11:00 AM period as a result of projected MBTA 2022 ridership growth. Project-related ridership is expected to be very limited during these morning periods.

9. Similarly, capacity is projected to be exceeded in the weekday 3:00 PM to 4:00 PM and 10:00 PM to midnight hours, regardless of any Project-related trips. For limited times in the late evening on Thursdays and Fridays, between 7:00 PM and 10:00 PM, some increase in crowding may occur largely as a result of Project-related trips rather than projected MBTA 2022 ridership growth.

10. Adverse impacts to MBTA bus capacity and operations and not expected.

5.1.3.4 Project Benefits Addressing Existing Local & Regional Transportation Issues

1. Subject to design development in coordination with MassDOT and the City of Boston, the proposed Route 1A improvements that are integral to the Project will go far beyond mitigating the potential impacts of Project trips, significantly improving safety and traffic capacity in the vicinity of the site, with reduced queuing and delays for both local and regional traffic as well as excellent access to the site for Project trips.

2. Of key importance, the incorporation of well-designed facilities for all sidewalks at intersections and roadway crossings will enhance pedestrian safety. In addition, the Project site layout has been designed to encourage pedestrian activity to, from and within the site by creating an attractive on-site pedestrian network and making appropriate connections to the existing off-site pedestrian network in the area.

3. As part of the Boston and Revere HCAs, and a proposed Surrounding Community Agreement to be executed with the City of Chelsea, and subject to design development in coordination with MassDOT, DCR and the Cities of Revere and Chelsea, the Proponent has committed to provide new ramp connections at the Route 1/Route 16 interchange, consistent with the Lower North Shore Transportation Improvement Study, and to improvements at other strategic locations along the Revere Beach Parkway corridor.

4. Subject to design development in coordination with MassDOT, DCR and the City of Revere, these improvements are expected to relieve the Route 60 corridor through Revere. As they are intended to address pre-existing regional traffic and safety problems, independent of the proposed Project, they would realize benefits for regional traffic that significantly exceed the potential impacts of Resort traffic.

5. The Route 1/Route 16 improvements provide significant relief to current safety and congestion at the Route 16/Webster Avenue/Garfield Avenue intersection in Chelsea with the removal of existing heavy u-turn movements from the westbound direction in order to access existing ramps or Route 16 eastbound.

6. A limited, but effective, lane widening improvement at Bell Circle will improve operations at that location, and is expected to mitigate the impact of Project trips.

7. Traffic, roadway and safety infrastructure improvements to address existing conditions will be provided at more than 10 other local intersections in Boston and Revere, as identified in Section 5.6, some of which are expected to experience limited or minimal Project impacts.

8. The Project site plan will provide an enhanced pedestrian and bicycle connection to the site and to Suffolk Downs Station, and will improve the existing ground shuttle service with more frequent service, thereby strengthening the connections between the Project and public transportation. In addition, the Proponent is working with the MBTA to create a more direct connection between the station entry/exit and the Project site/shuttle stop.

9. The Proponent is working with the MBTA to define improvements to be made at the Suffolk Downs Station, and is discussing enhancements of rapid transit service and local bus connections/facilities.

10. The Project will provide on-street bicycle accommodations, with spur bicycle connections to and through the Project site. These improvements will create an on-street 'beach-to-beach' connection between Constitution Beach to the south, Revere Beach to the north, and to Belle Isle Marsh, and will enhance bicycle access to the Project's on-site bicycle accommodations and parking. The Proponent has also committed to install two bike-share Hubway stations on the Project site, one near the Resort and one near Suffolk Downs Station, when the program is expanded to East Boston.

11. The Project site plan will enhance and strengthen the safety and quality of the existing pedestrian link across the site from the Orient Heights neighborhood and to the Crescent Beach neighborhood in Revere, and effectively create pedestrian as well as bicycle linkages connecting communities and open space through the new landscape of the Project site.

5.1.3.5 Parking and Transportation Demand Management (TDM)

1. The existing site parking supply of some 6,000 spaces far exceeds the demand associated with the proposed Project, and the total number of parking spaces will be reduced to a supply of 5,100 spaces, which will adequately accommodate the Project's peak parking demand.

2. With the exception of disabled employees and a limited number of parking spaces (estimated to be less than 50) for key management and essential employees, employee parking will not be provided on site. Employee parking will be provided in multiple remote locations, and employees choosing to drive will arrive and depart the site by shuttle bus.

3. Parking management and enhancement of connectivity/access to alternate travel modes (including transit, bicycle and pedestrian) will be supported by a robust TDM Plan. The TDM plan will comprise a comprehensive package of incentives to encourage non-single occupant vehicle travel, including public transit as an access mode, particularly for employees.

5.1.3.6 Sustainable Design Principles

Regardless of the design option selected, the design process of the off-site roadway improvements will seek to incorporate sustainability principles wherever possible. With MassDOT's GreenDOT Policy Directive as a guide and recognizing the City of Boston's strong and longstanding commitment to sustainability, the Proponent will work with appropriate public and private stakeholders to consider, incorporate, and implement planning, design and construction criteria and guidance from such sources as the Greenroads Foundation's Greenroads Rating System and the Institute for Sustainable Infrastructure's Envision Sustainable Infrastructure Rating System. These programs are designed to encourage technically superior design outcomes with long-term metrics for environmental performance.

5.2 2012 Existing Conditions

This section describes existing transportation conditions in the study area including transit service, pedestrian and bicycle accommodations, the local and regional roadway networks, existing traffic volumes, crash data, and parking (on- and off-site).

5.2.1 Public Transit

The Project site is well-served by public transportation, with several public transportation options within one-quarter mile of the site including bus routes and Blue Line rapid transit services provided by the MBTA. These services are illustrated in Figure 5-2, and their service and operational characteristics are described in further detail below.

5.2.1.1 Blue Line Rapid Transit Service

The Blue Line rapid transit line provides service from Wonderland Station in Revere to Bowdoin Station in Boston, running every five minutes during the weekday peak period. The closest station to the Project site is Suffolk Downs Station, which is accessible from both Bennington Street and Waldemar Avenue. The Blue Line connects with the Orange Line at State Street, the Green Line at Government Center, and water shuttle service at Aquarium. According to the 13th Edition of the Ridership and Service Statistics Blue Book published by the MBTA in 2010 (the "Blue Book"), on a typical weekday approximately 44,233 riders board the Blue Line, 794 of whom are reported to board at Suffolk Downs Station, equivalent to less than 2% of the line ridership.

Rolling Stock

The MBTA's Blue Line trains are unique to the rest of the MBTA's system: the propulsion system is powered from the third rail and an overhead pantograph. The third rail, which provides power to the rail cars, is placed alongside the track from Bowdoin Station to Airport Station, where the line is underground. Between Airport Station and Wonderland Station, where the line operates on the surface in a dedicated right-of-way, the overhead pantograph is used. The pantograph is mounted on top of the Blue Line car and draws power from the overhead catenary system.

As stated in the Blue Book, the Blue Line uses Number 5 East Boston cars (manufactured by Siemens in 2007-2009) that were introduced to replace the older Number 4 cars. Each car is 48.8 feet long and approximately nine feet wide, with a seating capacity of 37 passengers.[1]

In September 2008, MBTA began operating six-car trainsets in revenue service on the Blue Line. All Blue Line stations can accommodate the six-car trains except the eastbound (outbound) platform at Bowdoin Station.

Hours of Operation

According to the 2010 MBTA Service Delivery Policy, Blue Line service operates from 5:00 AM to 1:00 AM on weekdays and Saturdays, and 6:00 AM to 1:00 AM on Sundays. Presently, Bowdoin Station is closed weekday evenings and on weekends after the 6:18 PM train. During those periods, Blue Line service begins and ends at Government Center).[2]

[2] Massachusetts Bay Transportation Authority, *Service Delivery Policy*, 2010 Update.

Headways

The headway is the elapsed time between one vehicle and the next traveling in the same direction. For this analysis, typical MBTA Blue Line service headways were provided by the Blue Book and verified using the MBTA subway schedule for spring 2013.[3] The headways for Blue Line operations are currently at 5-, 9-, or 13-minute intervals, depending on the time of day. Blue Line service operates at 5-minute headways during weekday peak periods and at 9-minute headways for weekday off-peak periods. On weekend days, the service operates at 9-minute headways. Blue Line service is provided by 13-minute headways during late night service after 10:00 PM on weekdays and weekends, and also for early Sunday morning service before 9:00 AM.

The 2010 MBTA Service Delivery Policy outlines the weekday time periods of service to determine how much service should be provided, as reflected in Table 5-1.

Table 5-1 MBTA Weekday Rail Time Period Definitions

Time Period	*Definition*
Early AM	6:00 AM - 6:59 AM
AM Peak	7:00 AM - 8:59 AM
Midday Base	9:00 AM - 1:29 PM
Midday School	1:30 PM - 3:59 PM
PM Peak	4:00 PM - 6:29 PM
Evening	6:30 PM - 9:59 PM
Late Evening	10:00 PM - 11:59 PM
Night/Sunrise	12:00 AM - 5:59 AM

As presented in Table 5-2, to determine current MBTA Blue Line capacity using existing ridership estimates and to more closely compare the hourly data supplied by the MBTA, peak periods were rounded to the nearest hour.

[3] Massachusetts Bay Transportation Authority, Service Schedules. Viewed on June 17, 2013 at http://www.mbta.com/uploadedFiles/Documents/Schedules_and_Maps/Subway/frequency-schedule.pdf

Table 5-2 Revised MBTA Weekday Time Periods

Time Period	*MBTA Weekday Definition*	*Subject Capacity Analysis*
Midday Base	9:00 AM - 1:29 PM	9:00 AM - 12:59 PM
Midday School	1:30 PM - 3:59 PM	1:00 PM - 3:59 PM
PM Peak	4:00 PM - 6:29 PM	4:00 PM - 6:59 PM
Evening	6:30 PM - 9:59 PM	7:00 PM - 9:59 PM

Loading Standard

The MBTA's Service Delivery Policy provides that its purpose is "to ensure that the MBTA provides quality transit services that meet the needs of the riding public," which is consistent with the MBTA's enabling legislation and other external mandates.

Vehicle Load Standards, as detailed in the Service Delivery Policy, define the levels of crowding that are acceptable by time period, mode, vehicle type and location. It should be understood that the vehicle load standards represent average maximum loads over the particular time period, expressed on a per-car basis. This means that, depending on scheduling constraints and passenger peaking characteristics (including the different loadings between individual cars on a train), some individual trips or vehicles may exceed the values expressed in the standards even though the average load complies.

In the case of the Blue Line, the Service Delivery Policy stipulates a Peak Maximum Load of 95 passengers per car for the 45-seat Number 4 cars, which amounts to a Peak Load Standard of 225 percent, the ratio of maximum passengers to seats. However, since the issuance of the 2010 Update of the Service Delivery Policy, the Number 4 cars have been retired and been replaced by the Number 5 cars with 37 seats along with spaces for wheelchairs and/or carriages. The length and width of Number 4 and 5 fleets are the same, and the 95-passenger-per-car capacity is effectively unchanged, except that there is slightly more circulating room within the redesigned car interior. However, for the purpose of this analysis, the conservative estimate of 225% for the vehicle load standard is used making each Blue Line Car's capacity 79 people as seen in Table 5-3 in the next section.

During off-peak time periods, the vehicle load standard varies depending on the location of the train. In the MBTA-defined "core" area of the Blue Line between Bowdoin and Maverick, the Load Standard is 140 percent, while outside of this "core" area, the Load Standard is 100 percent.

Hourly Blue Line Capacity

Utilizing information gathered as previously described, the hourly capacity per hour, per time period was established. Utilizing the conservative vehicle load standard and the number of cars per train, the capacity of each train during the peak period within the core is estimated at 473 people. Utilizing the headways prescribed by the Spring 2013 schedule, an hourly capacity during the peak periods within the core is determined to be 5,670 people. Table 5-3 shows the hourly Blue Line capacity throughout the day.

Table 5-3 Blue Line Hourly Capacity per Time Period

Period	*Seats/ Car*	*Passengers/ Seats (Load Standard)*	*Total Calculated Capacity/Car*	*# Carss*	*Capacity/ Train*	*Train Headways (minutes)*	*Trains/ Hour/ Period*	*Capacity/ Hour/ Period*
Rush Hour	35	225%	79	6	473	5	12	5,670
Midday Core	35	140%	49	6	294	9	7	1,960
Midday	35	100%	35	6	210	9	7	1,400
Midday School	35	225%	79	6	473	9	7	3,150
Evening Core	35	140%	49	6	294	9	7	1,960
Evening	35	100%	35	6	210	9	7	1,400
Late Night Core	35	140%	49	6	294	13	5	1,357
Late Night	35	100%	35	6	210	13	5	1,400

Existing Blue Line Ridership Demand

While occasional events may trigger unusual ridership spikes, it is the service demand during weekday rush hours that generally determines the capacity of a transit line. For this analysis, the MBTA provided one-day passenger count data for Thursday, September 20, 2012, which represents typical weekday MBTA service demand. This weekday data consisted of boardings and alightings at each station.

Saturday passenger count data were also provided by the MBTA as a composite of fifty-three (53) Saturdays between July 1, 2011 and July 1, 2012. The existing analysis for the composite Saturday data includes total line volume by hour and station exit information.

Using the information supplied by the MBTA, existing Blue Line travel demand in terms of riders per hour and direction was analyzed.

Existing Suffolk Downs Station Passenger Boardings & Alightings

Based on the MBTA-supplied data from 2012, existing hourly passenger boardings and alightings by direction at Suffolk Downs Station for a typical weekday and Saturday are presented in Table 5-4 and Figure 5-3.

Table 5-4 Suffolk Downs Blue Line Station Existing Platform Activity

Time Period	*Weekday Ridership*		*Saturday Ridership*	
	Inbound Platform	*Outbound Platform*	*Inbound Platform*	*Outbound Platform*
5:00 AM - 6:00 AM	9	4	3	6
6:00 AM - 7:00 AM	59	12	7	4
7:00 AM - 8:00 AM	102	7	7	6
8:00 AM - 9:00 AM	126	15	30	2
9:00 AM - 10:00 AM	59	19	17	27
10:00 AM - 11:00 AM	58	24	21	64
11:00 AM - Noon	31	44	22	113
Noon - 1:00 PM	30	78	46	122
1:00 PM - 2:00 PM	49	52	54	113
2:00 PM - 3:00 PM	44	73	60	48

11:00 PM - Midnight	12	19	4	12
Midnight - 1:00 AM	2	4	10	5
Total	836	844	636	706

Source: MBTA

As shown, the existing use of Suffolk Downs Station is very low, and it is by far the least-used station on the Blue Line. Total weekday daily boardings and alightings at the station are limited to approximately 1,680 riders, which represent less than 2% of all daily Blue Line passenger volume.

Peak Loadpoint

The peak loadpoint is defined as the location of maximum utilization of a transit line (in other words, the station-to-station pair with the highest ridership). The heaviest loadings on the Blue Line during most daytime intervals occurred mostly between Maverick and Aquarium stations. Hourly ridership by direction between Maverick and Aquarium stations is presented for a weekday and Saturday in Figure 5-4. The charts also include line capacity as it varies during the course of the day.

On a typical service weekday, westbound (inbound) trains towards Bowdoin carry approximately 32,000 riders. The peak loadpoint occurred between 8:00 AM and 9:00 AM with over 5,000 passengers. The maximum hourly volume during the weekday evening peak is approximately 4,000 riders on trains travelling eastbound (outbound) towards Wonderland between 5:00 PM and 6:00 PM, where the expected combination of MBTA commuter peak and Project peak is to occur. These volumes represent 80 percent of the maximum volume when compared to the morning peak. Therefore, from a capacity standpoint, the morning peak period governs the capacity requirements of the Blue Line service.

As shown, using the conservative load standards the Proponent has adopted for this analysis, the Blue line operates within its capacity throughout weekday and Saturday operations with the exception of some over-crowding between 9:00 and 10:00 AM on a weekday and 10:00 PM and midnight (understood to occur only on Thursday and Friday).

5.2.1.2 Bus Service

The two local MBTA bus routes operating closest to the Project site are described below:

- **Route 119** operates along the northern end of the Project site on Winthrop Avenue and stops at 560 Winthrop Avenue when operating from Northgate Shopping Center towards the MBTA Blue Line's Beachmont Station. When Route 119 buses are operating from Beachmont Station in the direction toward Northgate Shopping Center, the nearest stop to the Project site is at 209 Revere Beach Parkway.

- **Route 120** operates on the southern side of the Project site in the Orient Heights neighborhood. Route 120 provides service to Orient Heights as it operates the MBTA Blue Line's Maverick station to the MBTA Blue Line's Orient Heights station. This is the only direction (northbound) in which the bus stop adjacent to 160 Waldemar Avenue, the closest stop to the proposed Resort, is served.

Bus Fleet

Bus Routes 119 and 120 operate out of the MBTA Lynn Bus Garage.[4] Based on assignments of the MBTA overall fleet, the buses operating out of the MBTA Lynn Bus Garage are 2008 New Flyer Emission Controlled Diesel (ECD) buses.[5] As stated in the Blue Book, these buses are 40 feet long and 8.5 feet wide and have a seating capacity for 39 passengers.

Hours of Operation

MBTA Route 119 and Route 120 services operate from 5:00 AM to 1:00 AM on weekdays and Saturdays, and 6:00 AM to 1:00 AM on Sundays.

Loading Standard

The MBTA's 2010 Update of its Service Delivery Policy states its purpose is "to ensure that the MBTA provides quality transit services that meet the needs of the riding public" and is consistent with the MBTA's enabling legislation and other external mandates. Vehicle Load Standards, included in the Service Delivery Policy document, define the levels of crowding that are acceptable by time period, mode, vehicle type, and location. In the case of bus service, the main determinant of the Load Standard is the time period. The 2010 MBTA Service Delivery Policy outlines the time periods of service to determine how much service should be provided, as reflected in Table 5-5.

Table 5-5 MBTA Weekday Bus Time Period Definitions

Time Period	*Definition*
Early AM	6:00 AM - 6:59 AM
AM Peak	7:00 AM - 8:59 AM
Midday Base	9:00 AM - 1:29 PM
Midday School	1:30 PM - 3:59 PM
PM Peak	4:00 PM - 6:29 PM
Evening	6:30 PM - 9:59 PM
Late Evening	10:00 PM - 11:59 PM
Night/Sunrise	12:00 AM - 5:59 AM

[4] MBTA Line Statistics Vehicle Recap as of September 2009, 2010 MBTA Blue Book Chapter 03, page11.

[5] MBTA Bus Assignments by Vehicle Class and Garage, July 2010, 2010 MBTA Blue Book Chapter 3, page 24.

In the case of the 2008 New Flyer ECD buses, the Service Delivery Policy stipulates a Peak Maximum Load of 54 passengers per bus, with a Peak Load Standard of 140 percent (the ratio of maximum passengers to seats). During off-peak time periods, the Load Standard on buses is 100 percent.

Existing MBTA Route 119 & 120 Capacity

The existing conditions analysis was completed using MBTA average passenger count data at each bus stop for service during the fall of 2012. The provided data consisted of boardings and alightings at each bus stop while also showing the total line volume by bus trip. For Route 120, ridership peaks on weekdays were approximately 35 passengers, while Saturday's peak volume was approximately 24 passengers. For Route 119, ridership peaks on weekdays were approximately 41 passengers, while Saturday peak volumes were approximately 25 passengers. Overall, the line volume never approaches the peak load capacity of 54 or even having all seats filled. Overall, both bus routes are primarily used by these local neighborhoods to get to and from the MBTA Blue Line.

In addition to local bus routes in the vicinity of the Project site, several commuter/express bus routes operate in the Route 1A corridor:

- **Routes 424, 434, 448 and 449** are all commuter buses running from different communities in the north shore to Haymarket Station or Downtown Crossing Station. Commuter routes have local service at the ends of the routes, but run express for the majority of the routes in and out of Boston. Although the routes travel down Route 1A/McClellan Highway/Lee Burbank Highway, there are no stops in the vicinity of the Project site.

- **Routes 450** (Salem Depot to Haymarket Station) runs from 4:46 AM to 1:42 AM on 30-minute headways during peak periods and 60- to 80-minute headways during non-peak periods. This bus route stops on Route 1A/McClellan Highway/Lee Burbank Highway in the vicinity of the Project site.

- **Route 459** (Salem Depot to Downtown) runs from 5:40 AM to 8:15 PM on 60- to 65-minute headways through the day. This bus route stops on Route 1A/McClellan Highway/Lee Burbank Highway in the vicinity of the Project site.

Table 5-6 presents a summary of existing MBTA transit service serving the Project site.

Table 5-6 Summary of Public Transit (MBTA) Service

Route #	*Description*	*Service Area*	*Peak Hour Headway (minutes)*	*Start Time*	*End Time*
119	Northgate – Beachmont Station	Cutler Circle, Linden Square, Revere Center, Coolidge Housing, Revere City Hall, and connections to the Blue Line	25-35	5:00 am	10:48 pm
120	Orient Heights – Maverick Station via Bennington Street	Waldemar Loop, Day Square, Eagle Square, Central Square East Boston, Jeffries Point and Connections to the Blue Line	16	5:25 am	1:18 am
424	Eastern Avenue & Essex Street – Haymarket or Wonderland Station	express	30	6:00 am	5:40 pm
434	Peabody – Haymarket Express via Goodwin's Circle	express	1 time/day	6:45 am	6:30 pm
448	Marblehead – Downtown Crossing	Paradise Road or Humphrey St, Lynnway and Airport	2 times/day	6:28 am	7:30 pm
449	Marblehead – Downtown Crossing	Paradise Road or Humphrey St, Lynnway and Airport	3 times/day	6:00 am	7:06 pm
450	Salem Depot – Haymarket Station	express	30-60	5:40 am	1:29 am
459	Salem Depot – Downtown	Logan Airport and Central Square, Lynn	15-30	5:00 am	1:10 am
Blue Line	Wonderland – Bowdoin Street	All stops	4	5:13 am	12:49 am

Source: MBTA

5.2.1.3 Shuttle Buses

Suffolk Downs racetrack operates a shuttle bus service between Suffolk Downs Station and the racetrack facilities. The shuttle runs with approximately 10-minute headways when the racetrack is open, with relatively low load factors.

5.2.2 Pedestrian Environment

In addition to collecting vehicle volume data, pedestrians were counted at many intersections. Data collection sheets are included in Attachment A. A brief overview of pedestrian activities in the study area follows.

Sidewalks are provided on the majority of the study area streets except for Tomasello Drive, a private way, which provides a sidewalk only for a short distance in the vicinity of the north driveway into the Project site. The physical condition of sidewalks is deficient in several locations.

Crosswalks are provided on the majority of the study area intersections, although ADA compliance is deficient at many locations. In addition, there are malfunctioning or missing pedestrian signal equipment (e.g., pedestrian push buttons or signal heads) at several locations.

Peak hour pedestrian volumes in the area are relatively low, with the exception of the commercial/transit nodes at Beachmont Station and Orient Heights Station.

In addition to localized repair and ADA deficiencies, there are missing or inadequate pedestrian accommodations at several key locations, most notably at the following intersections:

- No crosswalk is provided on Winthrop Avenue to the east of Tomasello Drive; and
- Although crosswalk guidelines are provided at the intersection of Route 16 with Route 145 (Winthrop Avenue) and Harris Street, there are no protected pedestrian accommodations in the signal phasing, and pedestrian signal heads and push buttons are not provided.

5.2.3 Bicycle Accommodations

The existing bicycle infrastructure in the immediate vicinity of the Project site is limited, although significant bicycle improvements have been made in the East Boston neighborhoods. The East Boston Greenway and bicycle accommodations along Chelsea Street and Bennington Street provide good connectivity south of the Project site.

Figure 5-5 presents existing local area bicycle accommodations, and also includes currently-planned future facilities.

5.2.3.1 East Boston Greenway

The East Boston Greenway is a linear park that runs within a former rail corridor approximately three miles between the East Boston waterfront and East Boston neighborhoods just north of Prescott Street. The Greenway is "L-shaped" and starts at Piers Park, runs along Marginal Street, turns 90 degrees and runs parallel to Bremen Street, and then terminates near Lovell Street. The Greenway provides mixed use pedestrian and bicycle paths and provides a good recreational connection between several parks in East Boston.

5.2.3.2 Chelsea Street and Bennington Street Corridors

The City of Boston has installed on-street bicycle lanes along Chelsea Street between Maverick Square in the south and Day Square to the north (approximately three-quarters of a mile). These bicycle lanes serve both directions and provide on-street accommodations parallel to the East Boston Greenway. A typical cross section of the road includes curbside parallel parking, a bicycle lane, and a single vehicular travel lane in each direction.

Shared lane markings exist on the length of Bennington Street between Neptune Road and Saratoga Street. Shared lane markings are provided on both sides of the street, which has a typical cross-section containing parking lanes on each side and two vehicular travel lanes in each direction. The shared lane markings are located on the travel lane adjacent to the curbside parking.

There is a gap in on-street bicycle accommodations between Day Square and Bennington Street, and no on-street bicycle accommodations are provided on Bennington Street north of Saratoga Street.

5.2.3.3 Planned Bicycle Infrastructure

The City of Boston has plans to extend the East Boston Greenway from its existing northern terminus to the new Neptune Green Park, adjacent to the Wood Island MBTA Station, between the Blue Line tracks and Logan Airport's new Green Bus depot, and to a small Wood Island Marsh Overlook park to be built at the end of Short Street. Construction of the extension is expected to begin in the near future.

Additional discussions regarding extending the Greenway to connect to Constitution Beach and even further to the Belle Isle Marsh Reservation are currently in the early phases of planning, and the future of these plans is unknown. This extension to the Belle Isle Marsh would provide a bicycle/pedestrian connection for the entire length of East Boston.

5.2.4 Roadway Network

The location of the Project site in relation to the regional roadway network is shown in Figure 5-6. The Project site is surrounded by Route 1A to the west, Route 145 (Revere Beach Pkwy/Winthrop Avenue) to the north, Bennington Street to the east, and Waldemar Avenue to the south.

The Project site is well located in relation to the Interstate and regional roadway systems. Specifically, the site is located on Route 1A approximately one mile north of the eastern terminus of I-90 (Massachusetts Turnpike) near Logan Airport, and therefore enjoys direct connections via the Ted Williams Tunnel to I-93 North and I-93 South (Southeast Expressway), as well as I-90 West continuing west through central Massachusetts. In

addition, Route 1A connects to and from Downtown Boston and I-93 via the Sumner (to downtown Boston) and Callahan (from downtown Boston) Tunnels. There is a toll for vehicles travelling toward downtown Boston in both the Sumner and Williams Tunnels.

From the north, Route 1 is an important regional corridor, but it relies on connections via Route 60 through Revere and a tenuous connection with Route 16/Revere Beach Parkway to access the Project site via Route 1A or Route 145 (Winthrop Avenue). Regional access issues associated with the Route 1/Route 16 connection are discussed in more detail in Sections 5.6 and 5.7. Additional sub-regional access from the north is provided by Route 1A through Swampscott and beyond, and via Route 60 to Route 107 to Salem.

Immediately to the west, Route 145 (Revere Beach Parkway) provides connections to Route 16, which in turn connects with I-93 in Medford, and, somewhat circuitously, to Routes 2 and 3 to the northwest.

5.2.5 Site Access

As shown in Figure 5-7, existing vehicular access to the site is provided by Tomasello Drive, a privately-owned roadway through the site, with connections to Route 1A and Route 145 (Revere Beach Pkwy/Winthrop Avenue). Furlong Drive, a public way from Route 1A to the Target/Stop & Shop plaza, provides an additional access connection between Route 1A and Tomasello Drive via a publicly-accessible private drive through the plaza.

Tomasello Drive at Route 1A is unsignalized, and left-turns out of the site to Route 1A southbound are prohibited, except during large events at Suffolk Downs when a police detail is provided. At Route 145 (Revere Beach Pkwy/Winthrop Avenue), Tomasello Drive is signalized in coordination with the off-set intersection at North Shore Road. While Furlong Drive connects with Tomasello Drive at a stop-controlled intersection within the site, turning movements to and from Furlong Drive at Route 1A are limited to right-in and right-out on the northbound side of Route 1A.

5.2.6 Study Area

The study area, as proposed in the ENF and expanded to include additional intersections requested by MassDOT, MBTA, and the cities of Boston and Revere, is presented in Figure 5-1. The study intersections (under signal control unless otherwise noted) include the following:

1. Route 1A at Suffolk Downs/Tomasello Drive (unsignalized/signalized with Project);
2. Route 1A at Furlong Drive (unsignalized);
3. Winthrop Avenue (Route 145) at Route 1A southbound On-Ramp;

4. (a) Winthrop Avenue (Route 145) at North Shore Road;
   (b) Winthrop Avenue (Route 145) at Suffolk Downs (Tomasello Drive);
5. Bennington Street/State Road at Winthrop Avenue;
6. Bennington Street at Saratoga Street;
7. Boardman Street at Route 1A;
8. Winthrop Avenue (Route 145) at Revere Beach Parkway (Route 16)/Harris Street;
9. (a) Route 60 (American Legion Highway) at Bell Circle;
   (b) Route 1A (VFW Parkway) at Bell Circle;
   (c) Route 16 and Route 1A at Bell Circle;
   (d) Beach Street at Bell Circle;
10. Ocean Avenue at State Road/Revere Beach Parkway;
11. Eliot Circle (roundabout);
12. Route 1A at Jughandle;
13. (a) Bennington Street at Neptune Road;
    (b) Neptune Road at Route 1A NB off-ramp;
14. Butler Circle (roundabout);
15. Revere Street at Route 60;
16. Brown Circle (roundabout);
17. Copeland Circle (three weave locations, three merge locations)
18. Route 1/Route 16 Interchange (three merge locations);
19. Route 16 (Revere Beach Parkway) at Garfield Avenue/Webster Avenue;
20. Route 1A northbound at Waldemar Avenue (unsignalized/signalized with Project);
21. Bennington Street at Crescent Avenue (unsignalized);
22. Route 1A SB at Curtis Street (unsignalized);
23. Neptune Road at Saratoga Street (unsignalized);
24. Neptune Road at Bremen Street (unsignalized);
25. Route 1A (North Shore Road) at Wonderland MBTA Station;
26. Route 1A (North Shore Road) at Revere Street;
27. Route 60 (Squire Road) at Charger Street; and
28. Route 60 (Squire Road) at Sigourney Street/ Mall Driveway.

Although the majority of study intersections in the Project vicinity operate under traffic signal control, three locations on Route 1A (Furlong Drive, Tomasello Drive, and Waldemar Avenue) are under stop control. The expanded study area includes four additional unsignalized locations (Bennington Street at Crescent Avenue, Route 1A SB at Curtis Street, Neptune Road at Saratoga Street, and Neptune Road at Bremen Street), and three rotaries or roundabouts (Elliot, Butler, and Brown Circles). Despite its name, Bell Circle (the intersection of Routes 1A, 16, and 60 (a.k.a. Mahoney Circle) is not a roundabout or rotary, but rather it is controlled by a set of four traffic signals. Similarly, Copeland Circle is not a roundabout, but comprises a series of weave and merge sections within its rotary-style layout. Because it comprises a series of on- and off-ramps, the Route 1/Route 16 interchange also involves merge locations.

The differences in the types of intersection control are reflected in the traffic operations analysis presented in Section 5.7.

5.2.7 Data Collection

To evaluate the existing operational conditions of the study area, existing traffic volumes were established and validated by conducting several count programs. Initially, bi-directional daily traffic volume data were collected for an entire week in June 2010 along Route 1A (two locations), Route 16, and Route 60, the key roadways surrounding the Project site.

Supplemental daily counts were performed for a full week in July 2012 along Route 1A, as well as at the three site access roads: Tomasello Drive at Route 1A, Tomasello Drive at Route 145, and Furlong Drive.

In addition to daily traffic volumes, manual TMCs were conducted in June 2010 at the majority of the study area intersections. These counts were conducted during the critical Friday evening commuter peak hours and Saturday afternoon hours to analyze the worst case scenario for projected Project trip generation. Where 2010 intersection data was not available, peak period TMCs were performed in April and May 2013, as well as for all additional intersections required in the Secretary's Certificate on the ENF.

To validate the 2010 traffic counts, MassDOT asked that the ATR counts performed at the four arterial locations in 2010 be repeated to determine if traffic levels generally have increased or decreased since that time. ATR counts were performed over the course of a full week in April 2013 at the same locations as the 2010 ATR counts, as follows:

1. Route 1A south of Furlong Drive;
2. Route 1A north of Route 145;
3. Route 60 north of Bell Circle; and
4. Route 16 west of Route 145.

Raw data collection sheets for all counts are included in Attachment A.

A comparison of 2010 and 2013 daily volumes is presented in Table 5-7, including average weekday, Friday, and Saturday volumes. As shown, weekday average daily traffic volumes have decreased consistently between 2010 and 2013, ranging from 2 to 4 percent on Route 1A to 7 percent on Route 60 and 12 percent on Route 16. A similar, but higher, pattern of decreasing traffic volumes between 2010 and 2013 is shown for Friday, with decreases ranging from 3 to 17 percent. Saturday daily volumes between 2010 and 2013 have increased by 3 percent on Route 1A south of Furlong Drive, but have decreased by 1 percent north of Route 145 and by 5 percent on Route 16.

ADT Average Daily Traffic (vehicles per day)
a Average Daily Traffic (Monday-Friday)
b Based on automatic traffic recorder counts conducted in June 2010
c Based on automatic traffic recorder counts conducted in April 2013
* Southbound data for Route 60 is based only on Monday data as the counter was damaged later in the week n/a
Southbound ATR tube damaged – no Friday data available at this location, so comparison is not available

Based on this analysis, MassDOT confirmed that the 2010 counts are valid as a basis for analysis, particularly as a growth rate of 0.5 percent per year is applied to the 2010 volumes to derive Existing (2012) volumes developed as the baseline for this analysis.

5.2.8 Existing Daily Traffic Volumes

Daily traffic volumes were established by ATR counts at seven locations in June 2010, as presented in Figure 5-8. Off-site ATRs across Routes 1A, 16, and 60 were conducted in April 2013. On-site ATRs, across Tomasello Drive and Furlong Drive, were conducted in July 2012. These counts were performed over a full week (seven-day) period, and include a repetition of the off-site ATRs near the Project site to provide a comparison with 2010 data.

The daily traffic volume information derived from the ATR data is summarized in Table 5-8. In addition to illustrating the pattern of traffic flow in the study area, as influenced by nearby land use and commuting patterns, these data also serve as the basis for identifying the critical analysis and design periods for the Project. As discussed in Section 5.4.1, it was determined that the critical (i.e., worst case) analysis periods for Project-related traffic impacts are the Friday evening peak hour and the Saturday afternoon peak hour, although it should be noted that the peak in Project trips does not coincide with these times due to the projected trip generation characteristics of resort traffic.

Daily traffic patterns from the ATRs show that the most traveled corridor of the locations counted currently is Route 1A south of Furlong Drive, with an average weekday daily traffic of approximately 59,360 vehicles per day. The directional split is slightly greater in the northbound direction towards Revere (57%). Route 16 west of Route 145 has a slightly higher split in the eastbound direction towards Route 1A (57%). On Saturday, traffic on Route 1A is approximately 10% less compared to Friday, the highest volume weekday. At other locations, traffic volume is approximately 2 to 8% lower on Saturday compared to Friday.

The three vehicular access points to the Suffolk Downs site have a combined average weekday daily traffic of approximately 15,940 vehicles per day. Of the 15,940 vehicles per day, 63% of the volume enters/exits on Tomasello Drive south of Route 145, 20% enters/exits on Furlong Drive east of Route 1A, and 17% of the volume enters/exits on Tomasello Drive east of Route 1A. On Tomasello Drive south of Route 145, the majority of traffic is exiting the site during the Friday evening peak hour (63%) and Saturday afternoon peak hour (56%). On Tomasello Drive east of Route 1A, the majority of traffic is entering Suffolk Downs during the Friday evening peak hour (85%) and exiting during the Saturday afternoon peak hour (52%). Traffic on Furlong Drive is mostly exiting Suffolk Downs during the Friday evening peak hour (56%) and entering during the Saturday afternoon peak hour (51%).

Table 5-8 Daily Traffic Volume Summary

Location	Average Weekday[1]				Friday				Saturday

Source: Automatic Traffic Recorder (ATR) counts conducted by VHB, Inc. in July 2012 and April 2013.
Note: Peak hours from the ATRs do not necessarily coincide with the peak hours of the TMCs. Evening peak hour is between 4:00PM and 6:00PM. Saturday peak hour is between 2:00PM and 5:00PM.

1. Average weekday represents average of Monday-Thursday.
2. Two-way daily traffic expressed in vehicles per day (vpd)
3. Two-way peak hour volumes expressed in vehicles per hour (vph)
4. The percent of daily traffic that occurs during the peak hour.

* SB ATR tubes damaged mid-week. Counts estimated based on 2010 ATR at same location.

5.2.9 Peak Hour Traffic Volumes

The Friday and Saturday peak period TMCs were evaluated to identify the peak one-hour (60-minute) period for analysis. The actual peak hour is not necessarily the same at each study location, but occurs between 4:00 PM and 6:00 PM on a weekday and between 2:00 PM and 5:00 PM on a Saturday. For analysis purposes, however, the actual peak for intersections in the vicinity was selected to reflect a conservative (worst case) analysis. In addition, it should be noted that the Friday afternoon peak volumes are generally higher than other weekdays, so the Friday afternoon analysis is more conservative than for other weekdays.

As noted previously, a nominal growth factor of 0.5% per year was applied to 2010 TMCs to establish a consistent 2012 Existing condition baseline, incorporating the April/May 2013 TMCs at the additional study locations. Again, the previous analysis shows that very limited, if any, growth has been experienced on area roadways over approximately the past five years, and indeed volumes at many locations have declined since that time.

The 2012 Existing condition Friday evening and Saturday afternoon peak hour traffic volumes at all study locations are presented in Figures 5-9 (A, B & C) and 5-10 (A, B & C), respectively. Traffic capacity and operational analyses for the 2012 Existing conditions are presented in Section 5.7.

5.2.10 Harbor Tunnels Traffic Volumes

Incomplete traffic volume data are available for the Williams and the Sumner/Callahan tunnels. Available data include:

1. Massport-provided volume data for the Sumner/Callahan Tunnels and eastbound Ted Williams Tunnel (TWT). Westbound TWT data was not available at the time of request. These included the following:

    - Hourly Sumner Tunnel data collected in June 2010 on a Monday through Friday. Saturday & Sunday data were not provided.

    - Average weekday hourly Callahan Tunnel data collected on a Monday through Friday in June 2010. Saturday & Sunday data were not provided.

    - Average hourly eastbound TWT data collected in May and June 2012. The data provided represent an average hourly volume for each day over the course of the months mentioned.

The data indicate that, of the average daily eastbound TWT traffic volume, approximately 60% is destined for Logan International Airport. According to the counts, Friday is the heaviest daily volume in the Sumner Tunnel while Thursday is the heaviest daily volume in the TWT eastbound. Callahan Tunnel data do not provide a breakdown by day.

While the TWT eastbound volume is higher on Thursday evenings, Friday is considered to be the critical day for analysis as it represents the highest projected Project impact to the study area with projected Project traffic volumes 33% higher on an average Friday than an average Thursday, while TWT eastbound daily traffic volumes only show a 1% higher volume on Thursday than Friday.

2. MassDOT volume data are available at the permanent count location 9101 for TWT in both directions from June 2005. While these data are useful for order of magnitude and directional distribution information, the data are somewhat dated for analysis purposes and likely reflect fluctuating changes associated with the CA/T project.

Available raw data for the tunnels are presented in Table 5-9, and calculated and/or adjusted data are presented in Table 5-10.

Table 5-9 Summary of Harbor Tunnel Volume Data (Raw)

5.2.11 Existing Project Site Traffic

Under existing conditions, the Project site generates trips associated with the Suffolk Downs racetrack which, although somewhat seasonal in nature, is operational throughout the year. In addition, the three vehicular site access points (Route 1A/Tomasello Drive, Route 145/Winthrop Avenue/Tomasello Drive, and Route 1A/Furlong Drive) attract other users not associated with the Project site itself. These include trips associated with the retail plaza abutting the site on Furlong Drive and un-related trips that utilize Tomasello Drive as a connection between Route 1A and Route 145/Winthrop Avenue.

It is difficult to distinguish accurately between different users of the three site access points, but the aggregate traffic volumes on each access road are identified in the Friday evening and Saturday afternoon peak turning movement network figures. Based on the daily driveway volumes presented previously in Table 5-8, approximately 63% of total existing driveway volumes use Tomasello Drive at Route 145, compared to approximately 17% on Tomasello Drive at Route 1A and 20% on Furlong Drive.

5.2.12 Crash Analysis

Study-area crash data were obtained from MassDOT records for the three-year period from January 2008 through December 2010. At the time the analysis was performed, this was the most recent data available.

Analysis of the crash data is summarized in the Table 5-11. The table includes the calculated crash rates (i.e., number of reported crashes per million entering vehicles) based on the Friday afternoon peak traffic volumes. A detailed summary by crash type is included in Attachment A.

The average crash rates at signalized intersections are 0.77 and 0.76 for District 4 and District 6, respectively, and for unsignalized intersections the average crash rates are 0.58 for both District 4 and District 6. Within the study area, all unsignalized intersections fall below the average crash rate. There are 13 signalized intersections that are at or below the average crash rate for their respective district, with no fatalities. Four signalized locations are above the average crash rate or involved a fatality, as follows:

5. Bennington Street & State Road at Winthrop Avenue;
8. Winthrop Avenue (Route 145) at Route 16 & Harris Street;
19. Route 16 at Garfield Avenue & Webster Avenue; and
26. Route 1A (North Shore Road) at Revere Street.

The number of crashes at most intersections below the average crash rate declined each year from 2008 to 2010. Most crashes at these locations were angle and rear end, causing property damage only. The crashes primarily occurred on weekdays outside of the peak hour on dry pavement. Of all the crashes at these intersections, only seven involved non-motorists.

Currently there are no metrics for average crash rates at roundabouts and interchanges. The crash rates for these intersections are all much higher than the average crash rate at a signalized intersection. Copeland Circle has the highest crash rate, over double the rate of all the traffic circles. Also, there was one fatal crash each at Copeland Circle, Butler Circle, and Bell Circle during the 2008 to 2010 analysis period.

The majority of these crashes were rear-end, angle, and single vehicle crashes. They were primarily property damage only, occurring on weekday and weekends outside of the peak hours on dry pavement.

Table 5-11 MassDOT Crash Analysis Summary

Intersection		*Total Crashes (3-year period)*	*Calculated Crash Rate*	*Average Crash Rate (District)*	*Intersection Type*
1	Route 1A / Suffolk Downs / Tomasello Drive	2	0.04	0.58 (6)	Unsignalized

5.2.13 Parking

A substantial portion of the Project site comprises surface parking, with a total capacity of approximately 6,000 spaces. Parking areas are generally defined by surface striping and limited raised curbing. Although crosswalks are marked along Tomasello Drive, there are no sidewalks or formal pedestrian walkways on the site. Relatively limited on-site parking occurs on a day-to-day basis, other than during racing season when up to approximately 1,200 cars are parked during the peak time (Saturday at 3:00 PM).

Off-site parking in the vicinity of the site is presented in Figure 5-11. While some time-restricted on-street parking is available, portions of the abutting residential neighborhoods are controlled by Resident Parking Permit restrictions. Limits of the East Boston and City of Revere Resident Parking Permit zones and time-restricted parking largely cover residential streets that are within easy walking distance of the MBTA stations, as a restriction to deter commuter parking in the neighborhoods.

The approximately 110-space MBTA parking lot at Suffolk Downs is typically fully occupied during weekdays, reflecting the level of park-and-ride activity associated with the Blue Line station.

5.3 2022 No-Build Traffic Projections

This section describes the projection of traffic volumes over a 9- to 10-year period to the 2022 horizon year assuming that the proposed Project is not built. The projections comprise general background growth due to regional growth and traffic associated with specific planned developments or transportation projects.

5.3.1 Background Growth

To inform the annual growth rate, MassDOT provided sample traffic growth projections developed by the Central Transportation Planning Staff (CTPS) for the 25-year period from 2009 to 2035, expressed as Vehicle Miles Travelled (VMT). This period encompasses both the 2012 Build analysis year and the 2032 Route 1A infrastructure design year analysis. Data include projections for Everett, Chelsea, and East Boston, and distinguish between "Freeway" and "Arterials/Local" roadways. The "Arterial/Local" data are presented in Table 5-12 below.

Table 5-12 CTPS Vehicle Miles Traveled (VMT) Growth Projections between 2009 and 2035

Time Period	*Arterial Vehicle Miles Traveled* [a]		*% Annual Growth* [b]	*% Cumulative Growth* [c]
	2009	*2035*		
AM Peak [d]	213,600	219,040	**0.1%**	2.5%
PM Peak [d]	139,100	140,060	**0.0%**	0.7%
Night [d]	180,570	188,040	**0.2%**	4.1%
Daily [e]	645,170	659,090	**0.1%**	2.2%

Source: CTPS (Central Transportation Planning Staff)/ MassDOT
a Arterial VMT in Everett, Chelsea, and East Boston
b Percent growth per year
c Percent cumulative growth from 2009 to 2035
d Presented as vehicle miles traveled per hour
e Presented as vehicle miles traveled per day

As clearly shown in Table 5-12, the state's projections for background regional growth in traffic are relatively limited, with only 0.1 percent growth per year during morning peak periods (yielding cumulative 2.5 percent by 2035), but no growth projected during evening peak periods. For nighttime, 0.2 percent growth per year is projected (yielding cumulative 4.1% by 2035), and on a daily basis 0.1 percent growth per year is projected (yielding cumulative 2.2% by 2035).

As agreed by MassDOT, a conservative (high) 0.5 percent per year background growth rate is incorporated in this analysis (in addition to the specific planned projects as noted previously). This will represent a conservative analysis, and will make allowance for projects not yet in the cities' planning processes, as documented in the following section. Growth from 2012 at 0.5 percent per year would yield cumulative growth of 5.1 percent by 2022 and 10.5 percent by 2032, significantly less than what is predicted in the CTPS model.

5.3.2 Planned Projects

In addition to regional background, traffic associated with other projects under construction or in the planning process is included in the No-Build condition projections. The cities of Boston and Revere identified the following projects for consideration, the locations of which are presented in Figure 5-12:

Revere Projects:

- Market Basket, consisting of approximately 83,000 square feet of retail;
- Verizon, an approximately 4,000-square foot retail store;
- Tedeschi Food Mart, approximately 4,700 square feet;

- Wonderland Market Place, consisting of approximately 62,000 square feet of retail;
- Harley Davison, a 40,000-square-foot specialty retail store;
- A Mobil gas station with approximately 10 pumps and 4,500 square feet of retail;
- A Prime gas station with approximately 10 pumps and 2,200 square feet of retail;
- Ward Street Residential, consisting of approximately 261 units;
- 526-646 Revere Beach Boulevard, an approximately 145-unit residential development;
- 525 Beach Street, an approximately 35-unit residential development;
- Thayer Avenue, an approximately 45-unit residential development;
- 55 Revere Beach Boulevard, consisting of approximately 55 residential units;
- Waterfront Square (Parcel I), consisting of approximately 194 residential units;
- Waterfront Square (North Lot), consisting of approximately 500 residential units;
- Wonderland Greyhound Track, a mixed-use development;
- Waterfront Square (Parcel H), a project involving approximately 400 hotel rooms, 149 residential units, and 50,000 square feet of retail;
- 197 Broadway, consisting of approximately 40 residential units and 4,000 square feet of retail'
- Wonderland Ballroom site, consisting of approximately 200 hotel rooms;
- Shaw's site, which is in the planning stage for an approximately 300-room hotel;
- For Kids, an academic facility for approximately 120 students;
- An elementary school relocation for approximately 690 students; and
- Della Russo stadium, which will seat approximately 2,000.

East Boston Projects:

- Clippership Wharf, consisting of approximately 400 residential units;
- Portside at Pier 1, consisting of approximately 178 residential units;

- Boston East, with approximately 191 residential units;
- Hodge Boiler Works, consisting of approximately 95 residential units;
- New Street Development, with approximately 224 residential units and a 235,000-square-foot hotel;
- 415 McClellan Highway, an approximately 117,060-square-foot hotel and retail project; and
- An approximately 42,800-square-foot Charter School.

Weekday afternoon peak and Saturday afternoon peak associated with each project was incorporated in the No-Build networks in one of the following ways:

1. Estimated traffic impacts available from studies or environmental documents;
2. Performed a trip generation, trip distribution and/or trip assignment analysis;
3. Project already included in background regional traffic growth;
4. Project already included in existing traffic counts; or
5. Project is too small or remote from the Project study area to have any meaningful effect.

As part of the proposed Project, major new roadway infrastructure will be constructed on Route 1A in the vicinity of the site, but these improvements will not be funded and, since they are not otherwise programmed, will not be built if the Project does not proceed, and therefore are not reflected in the 2017 No-Build conditions.

5.3.3 Use of Project Site

The proposed Project will retain the existing racetrack operations at Suffolk Downs. In the event that the Project does not proceed, however, it is anticipated that the racetrack function will not be sustainable in the long term, and that more realistically the entire Suffolk Downs site might be developed for some form of mixed-use development. This potential outcome is not anticipated in the near term, however, and therefore the potential traffic associated with such a build-out is not included in the 2022 No-Build traffic projections.

5.3.4 Peak Hour No-Build Traffic Volumes

The 2012 Existing condition traffic volumes were adjusted and projected to a ten-year 2022 No-Build condition based on the foregoing assumptions. The projected traffic turning movement volumes at all study intersections for the Friday evening and Saturday afternoon peak hours are presented Figures 5-13 (A, B & C) and 5-14 (A, B & C), respectively.

Traffic capacity and operational analysis for the 2022 No-Build conditions are presented in Section 5.7.

5.4 2022 Build Conditions

This section describes the projected travel demand for the Project by all modes and the development of the 2022 Build condition traffic volumes on study area roadways for analysis of potential traffic impacts. The latter were developed by distributing the Project-generated vehicular traffic volumes geographically, and assigning them to the study area roadways. Project-generated transit trips are presented in Section 5.7.

5.4.1 Project Travel Demand

The Institute of Transportation Engineers (ITE) Trip Generation manual does not contain guidance appropriate to the primary proposed Project land use. Therefore, the Project trip generation projections are based on research of data for other comparable projects, and information provided by the Proponent including proprietary data for existing gaming venues and projected data for its proposed operations at Suffolk Downs. A synthesis of information and data used in the development of the Project travel characteristics and trip generation is included in Attachment A.

5.4.2 Trip Generation Characteristics

The trip generation characteristics of the proposed Resort are unique to this type of proposed land use. In addition, the general travel demand characteristics must be adjusted to reflect the unique geographic location of the proposed Project and its supporting transportation infrastructure.

Project trip generation will vary by both day of week and time of day, and is based on the arrival and departure patterns at numerous existing Caesars resorts, as projected for this Project. As shown in Table 5-13, approximately 55% of the weekly gaming activity is expected to occur on Friday, Saturday, and Sunday.

Table 5-13 Project Activity by Day-of-Week

Day of Week	*% of Weekly Activity*
Monday	10%
Tuesday	10%
Wednesday	12%
Thursday	13%
Friday	18%
Saturday	20%
Sunday	17%

Source: Caesars Resort patron data

Since the proposed Project will operate 24 hours per day, there is significant variation in trip generation throughout the day. It is important to note that the hourly distribution for employees is different than for patrons. In addition, it should be noted that, although there will be employee shift changes, they will not create distinctly concentrated peaks in trip generation, as there will be a wide range of employee types with differing shift changes that will not necessarily coincide.

Table 5-14 presents the projected arrival and departure patterns for Project trips for an average weekday by percentage of the entire day. The distribution by time of day is based on an analysis of data for other gaming facilities owned or operated by Caesars. It should be noted that, because patrons constitute the majority of trips generated by the proposed Project, it is the pattern of patron trips that largely determines the distribution of total trips over the course of the 24-hour day.

Table 5-14 Average Weekday Hourly Trip Patterns

Time of Day[1]	*Percentage of Patron Trips*		*Percentage of Employee Trips*	
	Entering	*Exiting*	*Entering*	*Exiting*
12:00AM	2.2%	3.3%	3.4%	5.0%
1:00AM	1.6%	2.9%	2.4.%	5.6%

[1] Hour commencing

On an hourly basis, the proportion of trips is very limited during the morning commuter peak period, and increases over the morning to a relatively constant level throughout the afternoon. Most notably, the peak in Project trips does not occur during the evening peak commuter period, but peaks at a later time in the early evening around 7:00 PM. On Saturdays, the Project peak occurs slightly later than on a weekday, at around 8:00 PM. Accordingly, the Project will not create a combination of peak Project trips with peak commuter trips. Nonetheless, as noted previously, the critical analysis periods for traffic operations are the Friday evening commuter peak hour and the Saturday afternoon peak hour.

5.4.3 Trip Generation Methodology

An extensive review of other gaming resorts in the U.S. was performed to establish trip generation rates for Project patrons. The initial review included the following locations:

- Sugarhouse, Philadelphia, PA;
- Harrah's – Columbus, Philadelphia, PA;
- Harrah's – Station Square, Philadelphia, PA;
- Crossroads – Gettysburg, Adams, PA;
- Coulitz Indian, Clark County, WA;

- Par-a-dice Casino, East Peoria, IL;
- Twin River Casino, Lincoln, RI;
- Casino at Ocean Downs, Berlin, MD;
- Newport Grand Slots, Newport, RI;
- Aqueduct Racetrack, New York, NY; and
- Horseshoe, Cleveland, OH.

In addition, a research report prepared to guide the Gaming Commission in Philadelphia, Pennsylvania was reviewed, as were data and traffic generation estimates for various filings in Massachusetts prepared in connection with the ongoing permitting of other proposed resort casinos. Information gathered for these gaming facilities included location, land-use context, program, parking, transit service, mode share, vehicle occupancy, trip generation and directional information. The information gathered is included in Attachment A. The research yielded much information and data to inform the trip generation analysis for the proposed Project, but the vast majority of the data obtained is based on studies rather than actual data collection. Some actual data were available for the Twin River Casino, Casino at Ocean Downs, and Newport Grand Slots locations, but these locations appear to yield somewhat low trip generation rates and are not considered to be good comparable gaming facilities as they do not offer live table games. Further, with the exception of Aqueduct and Cleveland Horseshoe, none of the locations are well-served by transit, unlike the Project site which enjoys rapid transit service at the site itself.

Sugarhouse in Philadelphia, for which actual counts are available, is a reasonably comparable gaming location, and these counts yielded trip generation rates that are generally consistent with most of the study rates. While trip rates derived from the Sugarhouse counts provided a first benchmark for the analysis, it was considered that additional count data were necessary to validate the rates. Accordingly, the Proponent identified the following selected locations, two of which include racetracks, as candidate locations that might yield comparable data for locations close to major cities:

- Parx Philadelphia Casino and Race Track, Bensalem, PA;
- Horseshoe Hammond Casino, Hammond, IN; and
- Chester Harrah's Casino and Race Track, Chester, PA.

Traffic counts were conducted at all three locations during March and April 2013. Counts for Hammond and Chester, both operated by Caesars, comprised hourly counts over the course of an entire week, while at Parx, which is not operated by Caesars, manual traffic counts were performed at access points for the site during the Friday evening and Saturday afternoon peak periods. Data collection sheets are included in Attachment A.

Results of the counts are summarized in Table 5-15 along with the trip rates per gaming position derived for each location on the Friday and Saturday peak hours. The number of gaming positions is the most commonly-used variable upon which trip generation is derived. It should be noted that none of the three selected locations enjoys rapid transit access, and local bus service is relatively limited. Therefore, while the counts record actual numbers of vehicles, the vehicular trip rates effectively account for all patrons and employees entering and exiting those facilities and are more than what is expected at the Project site, which has the benefit of readily available transit access and good bus service.

Table 5-15 Comparable Vehicle Trip Generation Rates Summary

Location	*Number of Gaming Positions*		*Direction*	*Friday Evening Peak Hour* *Trips*	*Trip Rate*	*Saturday Afternoon Peak Hour* *Trips*	*Trip Rate*
Parx Philadelphia Casino & Race Track	Slots	3,535	In	922	0.19	932	0.19
	Tables	1,248	Out	859	0.18	1,243	0.26
	Total	**4,783**	**Total**	**1,781**	**0.37**	**2,175**	**0.45**
Horseshoe Hammond Casino	Slots	3,015	In	384	0.09	416	0.10
	Tables	1,035	Out	435	0.11	594	0.15
	Total	**4,050**	**Total**	**819**	**0.20**	**1,010**	**0.25**
Chester Harrah's Casino & Race Track	Slots	2,832	In	845	0.23	642	0.17
	Tables	849	Out	717	0.19	492	0.13
	Total	**3,681**	**Total**	**1,562**	**0.42**	**1,134**	**0.31**

Source: Counts performed by VHB, March/April 2013

Of the three locations, Horseshoe Hammond yields the lowest vehicle trip rates at 0.20 and 0.25 per gaming position for the Friday and Saturday peak hours, respectively. Parx yields rates of 0.37 and 0.45 vehicle trips per gaming position for Friday and Saturday peak hours, respectively, while Chester yields rates of 0.42 and 0.31 vehicle trips per gaming position for Friday and Saturday peak hours, respectively. Because the Hammond rates are so much lower, they were eliminated from the analysis, and the average peak hour trip rates of Parx and Chester were used for the DEIR/EPNF Friday evening peak hour analysis. For the Saturday afternoon peak hour, these rates were adjusted based on daily and hourly distribution of Project trips. Corresponding trip rates incorporated in the analysis are as follows:

- Friday: 0.21 In + 0.19 Out = 0.40 Total vehicle trips per gaming position.
- Saturday: 0.23 In + 0.18 Out = 0.41 Total vehicle trips per gaming position.

As noted previously, the vehicular trip rates established by counts for the comparable locations account for all patrons and employees entering and exiting those facilities, as all access for patrons and employees essentially relies on vehicular modes.

To determine trip generation by mode for the proposed Project, mode share and vehicle occupancy parameters were established for patrons and employees separately, as described in the following sections.

5.4.4 Projected Project Person Trips

The numbers of patrons and employees projected by the Caesars patron gravity model and employment projections for the Project are presented in Table 5-16. As shown, approximately 28,500 average daily person trips are projected for the Project, but, as noted previously, there is significant variation in daily trips, particularly between weekends, Fridays, and other weekdays. Approximately 55% of person trips each week are expected to be generated on Friday, Saturday, and Sunday combined, with the highest daily person trip generation, 39,320, occurring on Saturday. Approximately 4,400 and 4,500 person trips are projected for the Friday and Saturday peak hours, respectively.

Table 5-16 Project Person Trip Generation

Person Type	*Average Weekday*	*Average Daily*	*Friday*		*Saturday*	
			Daily	*Evening Peak*	*Daily*	*Afternoon Peak*
Patrons	23,674	26,773	32,992	4,200	37,148	4,152
Employees	1,645	1,743	2,222	187	2,171	314
Total	**25,319**	**28,516**	**35,214**	**4,387**	**39,319**	**4,466**

Note: Person trips are expressed as total entering and exiting

5.4.5 Mode Share and Vehicle Occupancy

As previously discussed, the Project will benefit from very good MBTA transit services. Indeed, it is unusual for a resort gaming facility to enjoy rail transit access with an immediately adjacent station (Suffolk Downs Station).

While a significant number of patrons are expected to use the MBTA or shuttle service provided by the Project, these modes will be more heavily used by employees, particularly as a result of the incentives in the TDM plan. Also, there will be a measurable component of walking and bicycle trips from the surrounding residential neighborhoods, especially with regards to employee trips.

The derivation of mode share and vehicle occupancy for patrons and employees is described separately in the following sections, and the resulting mode share and vehicle occupancy parameters for the Project are summarized in Table 5-17.

5.4.5.1 Patrons

Mode share for Project patrons is partially based on information from Caesars, where approximately 5% of patrons travel to the resorts by private coach or shuttle. For rapid transit access provided by the MBTA Blue Line, however, an analysis of the penetration of MBTA rapid transit service within the patron catchment area established by Caesars' gravity model for the Project was performed.

In brief, the transit penetration analysis identified the availability of MBTA stations within each zip-code, thereby establishing the number of patrons with access to transit for their journey to and from the Project. The number of patrons in each relevant zip-code was then adjusted as follows:

1. The geographic location of the station relative to the residential areas within the zip-code; and

2. Application of existing mode share for the location based on mode shares required for analysis in traffic studies prepared for BTD. This information is derived from the City of Boston Access 2000-2010 Citywide Transportation Plan.

The resulting projections of patrons from each zip-code expected to choose MBTA transit as their mode of travel to and from the Project were aggregated, resulting in a projected 11% patron transit mode share. While some patrons are expected to travel to the casino by bicycle or walking, this was not factored into the analysis to provide a conservative (i.e., worst case) traffic analysis.

Average vehicle occupancy for patron cars was established to be 2.0 patrons per car, based on characteristics at other Caesars locations, and an average vehicle occupancy of 30 patrons was used for private coaches and shuttles.

5.4.5.2 Employees

A 10% transit use factor by employees at the Horseshoe Casino in downtown Cleveland, which is located directly above a downtown subway station, was used as a basis to most closely approximate access to transit at any of the sites studied with that offered at the

Project site. However, the transit mode share was adjusted to reflect the significantly different intensity of transit use in Boston compared to Cleveland. This adjustment was determined based on an analysis of overall transit mode share in the Greater Cleveland area compared to the Boston region.

This analysis yielded a three-fold difference between Boston and Cleveland, resulting in a projected 30% transit share for Project employees. As noted above, a limited number (estimated at less than 50) of parking spaces will be available for key management and essential employees at the site. The remaining employees are expected to access the site via a ground shuttle sponsored by the Proponent, with the exception of employees with disabilities who will be able to use designated spaces on-site.

Average vehicle occupancy for employees was based on US 2000 Census Journey to Work data from local census tracts surrounding Suffolk Downs.

It should also be noted that, while the Proponent's policy of limiting employee parking at the Project site (in favor of a ground shuttle program) may have the effect of encouraging more employees to use transit, the Proponent does not expect that the number of additional employees opting for transit will be measurable (as a percentage of total transit trips) to change the assumptions presented in the analysis.

Table 5-17 Mode Shares and Vehicle Occupancy

	Patrons		*Employees*	
Mode	*Mode Share*	*AVO*	*Mode Share*	*AVO*
Auto/Taxi	84%	2.0	63%	1.2
Public Transit	11%	-	30%	-
Shuttle Bus/Coaches	5%	30.0	-	-
Walk/Bike	< 1%	-	7%	-
Total	**100%**	-	**100%**	-

5.4.6 Projected Project Trips

Based on the previously described trip rates, mode share, and vehicle occupancy established for the Project, the projected average daily Project patron and employees trips by mode are presented in Table 5-18.

Table 5-18 Average Daily Trips by Mode

Daily Trip Type by Mode	*Patrons*	*Employees*	*Total*
Visitations (Persons)	*26,773*	*1,743*	*28,516*
Person Trips (Enter + Exit)	**53,546**	**3,486**	**57,032**
Person Trips by Auto/Taxi (84% Patrons, 63% Employees)	44,716	2,196	46,912
Vehicle AVO	2.0	1.2	n/a
Auto/Taxi Trips	22,358	1,830	24,286
Person trips by Shuttle/Coach (5% Patrons)	2,940	-	2,940
Shuttle/Coach AVO	30.0	-	n/a
Shuttle/Coach Trips	98	-	98
Total Vehicle Trips	***22,456***	***1,830***	***24,286***
Public Transit Trips * (11% Patrons, 30% Employees)	5,890	1,046	6,936
Walk/Bike Trips (Negligible % Patrons, 7% Employees)	Limited	244	244
Total Non-Vehicle Trips	***5,890***	***1,290***	***7,180***

Note: Daily trip generation is expressed in "trips per day, enter + exit"
* Transit trips are based on daily demand. In practice, during the night-time period when MBTA service is not available, those transit trips will shift to earlier or later times, or be diverted to vehicular modes.

Resulting projections of total Project trips (patrons and employees combined) for the average day, Friday evening peak, and Saturday afternoon peak hours by each mode are presented in Table 5-19.

Table 5-19 Project Trip Generation by Mode

Trip Type	Enter/Exit	Average Daily				Friday Evening Peak Hour				Saturday Afternoon Peak Hour			
		Autos/ Taxis	Shuttles/ Coaches	Public Transit	Walk/ Bike	Autos/ Taxis	Shuttles/ Coaches	Public Transit	Walk/ Bike	Autos/ Taxis	Shuttles/ Coaches	Public Transit	Walk/ Bike
Patrons	Enter	11,179	49	2,945	-	917	4	240	-	949	4	249	-
	Exit	11,179	49	2,945	-	847	3	222	-	794	3	208	-
	Total	22,358	98	5,890	-	1,764	7	462	-	1,743	7	457	-
Employees	Enter	915	-	523	122	59	-	34	8	116	-	66	15
	Exit	915	-	523	122	39	-	22	5	50	-	28	7
	Total	1,830	-	1,046	244	98	-	56	13	166	-	94	22
TOTAL	**Enter**	**12,094**	**49**	**3,468**	**122**	**976**	**4**	**274**	**8**	**1,065**	**4**	**315**	**15**
	Exit	**12,094**	**49**	**3,468**	**122**	**886**	**3**	**244**	**5**	**844**	**3**	**236**	**7**
	Total	**24,188**	**98**	**6,936**	**244**	**1,862**	**7**	**518**	**13**	**1,909**	**7**	**551**	**22**

A portion of the Resort vehicle trips will comprise existing trips, including the following:

- trips passing the site or diverted from other parts of the local roadway network;
- trips associated with the existing retail plaza;
- trips passing through the site between Route 1A and Route 145; and
- trips associated with the existing racetrack, including employees and visitors, who will also use the new Resort facilities.

To present a conservative (worst case) analysis, no trip "credits" have been applied to these diverted existing trips, and the total Project trips presented in Table 5-19 are incorporated into the 2022 Build analysis. As shown, the Project would generate approximately 1,869 vehicle (auto, taxi, shuttle and coach combined) trips (total entering and exiting) in the critical Friday afternoon peak analysis hour including patrons and employees. Total Project vehicle trip generation during the Saturday afternoon peak hour would be slightly higher, at approximately 1,916 vehicle trips.

5.4.7 Vehicular Trip Distribution & Assignment

The geographic directional distribution of Project trips is a function of several variables including the relative locations and densities of population, competing land uses, existing travel patterns, and the efficiency of roadways leading to the Project site. The

geographic distribution of patron trips and employee trips will be different. The following section explains the methodology applied to the patron and employee vehicular trip distribution.

Patrons

- Trip distribution patterns were developed based on the gravity model prepared by Caesars that has been proven in other locations and yields the geographic distribution of patrons by community or zip-code. This gravity model accounts for gaming competition, the attractiveness of the facility, and the location of the facility relative to the patron's location.
- The distribution is adjusted as described in Section 5.4.5 to account for transit penetration.
- Patron vehicle trips were then assigned to the regional and local highway network based on existing travel patterns and route choices available to drivers.
- MassDOT expressed concern that the distribution of vehicle trips from the Caesars gravity model did not reflect the overall regional traffic distribution. Accordingly, the model distribution was adjusted to shift more trips to the I-93 Southeast Expressway, resulting in a five percentage point shift of Project vehicle trips from the Sumner/Callahan tunnels to the TWT.

Employees

- Trip distribution patterns were developed based on the 2000 U.S. Census Journey to Work data for Census tracts 511, 1707, and 1708 which encompass the Project site as well as abutting communities, adjusted to recognize commitments the Proponent has made with respect to local employment and the fact that, with the exception of employees with disabilities, key management, and essential personnel (estimated at less than 50), no employee parking will be located at the Project site.
- Employee vehicle trips were then assigned to the regional and local highway network based on existing travel patterns and route choices available to drivers.
- Availability of alternative modes of transportation is considered when establishing a vehicular trip distribution for the region. Reasonably convenient access to transit allows more person trips from the metro-Boston area to access the property via transit; accordingly, the vehicular trip distribution was adjusted to account for this penetration. Local bus route access was also a key component of the employee trip distribution as the Journey to Work data indicated a significant proportion of employees will reside within the local study area.

- Employee vehicle trips were then assigned to the regional and local highway network based on existing travel patterns and route choices available to drivers. Employees were considered to potentially be more inclined to take alternative "more informed" routes to work than patrons.

A further factor in the assignment of Project trips is the impact of tolls returning westbound through the Sumner Tunnel. It is expected that some trips arriving through the Callahan Tunnel will depart via Route 16 to access I-93 North to avoid paying a toll. Project trip distribution and assignment reflects an outbound trip diversion of 11% for patrons and 3% for employees to Route 16 to avoid paying the toll.

The overall regional distribution and assignment of Project vehicle trips is summarized in Table 5-20. Figures 5-15 (A & B) present patron and employee vehicular trip distribution, respectively.

Table 5-20 Project Vehicular Trip Distribution by Direction

	Patron Vehicle Trips[1]		*Employee Vehicle Trips*[2]	
Travel Route	*Inbound*	*Outbound*	*Inbound*	*Outbound*
Route 1A (to/from north)	2%	2%	9%	9%
Route 107	2%	2%	8%	8%
Route 1	18%	18%	6%	6%
I 90 (Mass Pike)/ Ted Williams Tunnel[3]	44%	44%	24%	24%
Route 1A/ Sumner-Callahan Tunnels[3]	25%	14%	5%	2%

Total	**100%**	**100%**	**100%**	**100%**

1 Regional data based on Caesars Gravity Model
2 2000 U.S. Census Journey to Work data for Census Tracts 511, 1707 and 1708
3 Includes shift of patron trips requested by MassDOT, as discussed above

The choice of routes by drivers to get to and from the Project site access points will be influenced by significant roadway infrastructure improvements. As noted previously, the Project includes major off-site roadway, traffic, and safety improvements, specifically construction of major new roadway infrastructure on Route 1A in the vicinity of the site. The proposed roadway changes are described in detail in Sections 5.5 and 5.6.

The assignment of trips to the roadway network reflects the foregoing considerations of choice of route by drivers and projected Project vehicle trips assigned to the study area roadway intersections. Resulting patron vehicular Project trips are presented for Friday

evening and Saturday afternoon peak hours in Figures 5-16 (A, B & C) and 5-17 (A, B & C), respectively. Employee vehicular Project trips are presented for Friday evening and Saturday afternoon peak hours in Figures 5-18 (A, B & C) and 5-19 (A, B & C), respectively.

5.4.8 Build Condition Traffic Volumes

Combining projected 2022 No-Build traffic volumes from Section 5.3 with projected Project patron and employee trips described above yields the 2022 Build condition traffic volumes. Build condition volumes are presented for Friday evening and Saturday afternoon peak hours in Figures 5-20 (A, B & C) and 5-21 (A, B & C), respectively.

It should be noted that, while employee trips have been assigned to the regional and local roadway network, with limited exception, employee parking will not be provided on site (see Section 5.10). Therefore, by including the employee trips in the Build network, the traffic operational analysis in Section 5.7 presents a conservative (worst case) examination of the Project impacts. As noted above, while the Proponent's policy of limiting employee parking at the Project site (in favor of a ground shuttle program) may have the effect of encouraging more employees to use transit, the Proponent does not expect the number of additional employees will be measurable to change the assumptions presented in the analysis.

A comparison of No-Build and Build traffic volumes at the ATR locations is presented in Table 5-21.

Note: Peak hours from the ATRs do not necessarily coincide with the peak hours of the TMCs. Evening peak hour is between 4:00PM and 6:00PM. Saturday peak hour is between 2:00PM and 5:00PM.

1. Average weekday represents average of Monday-Thursday.
2. Daily traffic expressed in vehicles per day (vpd)
3. Peak hour volumes expressed in vehicles per hour (vph)
4. 2022 No-Build daily volume based on background growth only, does not include No-Build project specific trips.
5. 2022 Build daily volume assumes peak hour analysis trip distribution patterns and mode shares represent daily.

* SB ATR tubes damaged mid-week. Counts estimated based on 2010 ATR at same location.

5.5 Route 1A and Site Access Alternatives Analysis

With almost 70% of Project vehicle trips projected to approach the site through the already congested and inefficient Boardman Street intersection, the inadequacy of the existing Tomasello Drive access to accommodate Project trips, and the community's attention to a viable grade-separated alternative at the location, development of an improvement program for this section of Route 1A is the primary focus of the off-site roadway infrastructure proposed in connection with the Project.

In response to community concerns about local access and potential impacts from Project-related traffic to the neighborhoods, an improvement concept to address these issues was developed and advocated for by the Proponent, comprising a Route 1A northbound flyover at Boardman Street, an additional Route 1A southbound lane, traffic signal control at Waldemar Avenue, and signalization of the Tomasello Drive intersection. The concept was advocated for and presented to the communities in East Boston and Revere, and was also included in the ENF for the Project. The transportation alternatives analysis presented in this DEIR/EPNF is anchored in this concept. Any such concept is subject to evaluation and approval by MassDOT and BTD.

In commenting on the ENF, MassDOT asked that the range of alternatives for the Route 1A corridor at Boardman Street be explored. This section of the DEIR/EPNF presents this analysis, which has been refined through on-going discussions with MassDOT. While the analysis is anchored on the flyover concept as presented publicly and advocated for by the Proponent publically, the overall study area traffic impact analysis for the Project remains the same under any of the Route 1A infrastructure improvement options considered, although clearly each option has distinct impacts (positive and negative) and attributes within this section of Route 1A itself. Those attributes are summarized in this section.

The commitment to the Route 1A improvements is recognized in the HCAs with the Cities of Boston and Revere. To provide some context on the needed roadway construction timing, the Resort is expected to be fully completed approximately 24 months after the start of construction, or 26 months after a gaming license is issued for the Project.

During the course of the preliminary evaluation of alternatives to the flyover solution, a range of options was identified, encompassing various combinations of flyover and at-grade solutions, some of which explored the feasibility of a southbound flyover at a later time if a northbound flyover is built as part of the Project. After initial discussions with MassDOT, the options were expanded to include additional alternatives designed to fully explore the range of possible improvements to roadway operations. Subsequent discussions with MassDOT resulted in the elimination of infeasible options, largely due to environmental and land impacts, and the potential need for modifications to accepted MassDOT design standards (design exceptions). This screening process reflected pre-existing constraints within the corridor north of Tomasello Drive resulting from wetlands adjacent to the roadway and impacts to nearby improved properties.

The following sections provide a summary description of the options that MassDOT and the BTD continue to consider for implementation. Three have been carried as at-grade alternatives (Options 1, 11, and 13) and three series involve an overpass (Options 4, 7, and 8). One other series includes a set of hybrid overpasses intended to eliminate left turns from the surface movements. Concept plans and information on roadway configuration, anticipated traffic operations, construction phasing (including traffic management during construction), schedule, estimated cost, and land impacts have been developed for each option. The LOS analysis for each option includes morning, evening and Saturday peak conditions for the 2022 DEIR/EPNF analysis timeline and 2032 design year assuming the Resort is in place. Project impacts to wetlands, air quality, and other significant land impacts are based on Alternative 4, on which all of the remaining alternatives are anchored.

In evaluating the traffic operations for each option, the existing conditions analysis for the Route 1A/Boardman Street intersection must be borne in mind. Under existing conditions (presented in Section 5.7), extensive queuing and delay are experienced on various approaches depending on time of day. One goal of the Project is to address this current need.

5.5.1 Option 1 – At-Grade Solution, Standard Design

This alternative, illustrated in Figure 5-22A, provides an at-grade surface solution to the existing condition capacity constraint with the addition of Resort-related traffic to 10- and 20-year design horizons. The Option adds travel lanes on three of the four intersection approaches and on two departures extending from south of Boardman Street to north of the existing Jughandle. Note that this plan also serves as the basis for development of Traffic Management plans allowing for various "flyover" options also under consideration as part of this analysis, where the Resort could be open and operating while construction activities in the Route 1A corridor might still be on-going or occurring in subsequent construction phases.

The basic operations maintains multiple phase signal operation, with overlapping left turn movement in the Route 1A corridor followed by through movements. Split side street signal phasing operation for the Boardman Street corridor is provided, a theme for the balance of the options, given the introduction of a double left turn configuration on Boardman Street westbound.

Four through/right turn lanes are provided on the northbound approach, extending over a 3,500- to 4,000-foot work area that transitions from the existing two lanes plus shoulder approaching Boardman Street and departing Tomasello Drive. Three lanes are provided southbound from Tomasello Drive, tapering to the two-lane with shoulder condition approximately 1300 feet south of Boardman Street. Widening has been maintained along the northbound side of the corridor, again for the most part consistent with other options developed for the area. Boardman Street westbound has been widened to a three-lane approach consistent with the commitment for corridor improvements as part of an approved development on the southeast corner of Route 1A and Boardman Street. No changes have been made to the Boardman Street corridor west of Route 1A.

Tables 5-22 (A, B & C) provide a summary of LOS (Synchro 7) for the Weekday morning, Friday evening, and Saturday afternoon peak hours respectively.

The construction schedule is estimated at 18 months. The basic construction process would provide for the widening along the easterly side of Route 1A, followed by median work that would establish the final southbound alignment.

5.5.2 Option 4 – Flyover Solution, East of Existing Route 1A Corridor

This alternative, illustrated in Figure 5-22B and which has been advocated for by the Proponent and presented in public meetings and the ENF, was developed to address longstanding community concerns while also accommodating Project-related traffic. It provides a northbound overpass as part of Project development, addressing the current source of congestion in the Route 1A corridor during peak hours and allowing additional demand associated with the Project to be effectively managed through the design year, which has been identified as 2032. The southbound movement, a morning congestion point which will see little additional demands associated with the Project during that critical period, has been addressed with the addition of a third southbound lane from Tomasello Drive through the Boardman Street intersection and then returning to the two-lane southbound section.

A widening of Boardman Street westbound has been proposed by others to address the existing morning peak issue experienced on that approach. This improvement will be completed as part of a mitigation program for an approved hotel development on the southeast corner of Route 1A and Boardman Street. Option 4 has been developed to be consistent with this work.

The overpass would be constructed east of the existing Route 1A corridor, allowing construction to proceed while mitigating impacts on the existing Route 1A traffic flow, which would be improved with the addition of a third northbound lane prior to the start of construction. Vehicles in the Route 1A northbound corridor, destined for Boardman Street or Route 1A southbound, would exit the corridor to the right approximately 1,050 feet south of Boardman Street.

At Boardman Street, the collector distributor function would shift to the west of the overpass and would use a portion of the existing at-grade northbound roadway. The entering movement to the northbound Route 1A corridor would be via a left side on-ramp, serving movements from Boardman Street east and west and from points south of Boardman Street.

Understanding the need to permit the indirect movements from Boardman Street to Waldemar Avenue and to the Project site, traffic signal control is proposed at the ramp junction at Waldemar Avenue. The initial concept also provided for a pedestrian crossing of the collector/distributor and mainline Route 1A lanes and a free flow opportunity from Waldemar Avenue. Based on discussions with MassDOT, the concept has been revised such that pedestrians would be relocated to the easterly side of the Route 1A northbound corridor, via a walk area under the overpass, and the movement from Waldemar Avenue would be placed under signal control in light of the lane arrangement between Waldemar Avenue and the Project driveway, Tomasello Drive. Modifications associated with these changes are illustrated in the layout plan for Option 4B, Figure 5-22C.

To minimize impacts to traffic during construction, the overpass would be constructed east of the existing Route 1A alignment and in fact east of the existing State Highway Layout. South of Boardman Street, the initial right of way line was identified at 96 feet east of the layout recognizing a 36-foot (+/-) structure width and a three-lane northbound ramp/collector corridor with a sidewalk. The down slope from the roadway to the existing property elevation would be addressed as either a slope or vertical wall.

North of Boardman Street, the overpass would be built into the existing embankment, which rises from a drainage swale 14 feet east of the back of sidewalk (22 feet east of the exiting curbline) on a 2:1 ratio. Some flattening and modification of this slope will be required along with construction of a back wall on the order of 10 feet in height at the point where the structure meets grade. The right of way line is approximately 62 feet east of the existing State Highway Layout and extends northerly across Waldemar Avenue to the Tomasello Drive intersection.

Option 4 has received a significant amount of public support in several public forums at which the Resort has been discussed and presented. The construction schedule to complete Option 4 is estimated at 18 months, and the milestone to complete the widening of Route 1A is expected to be achieved in 12 months.

5.5.3 Option 4B – Flyover Solution, East of Existing Route 1A Corridor

An Option 4B was developed to illustrate the ability to construct a southbound flyover at a point in the future. It was discarded and replaced with Option 4B, presented in Figure 5-22C, which provides the same basic feature of permitting a southbound flyover in the future while at the same time addressing MassDOT's request that a traditional right exit/right entrance ramp system be provided from Route 1A southbound instead of the left off/left on ramps in Option 4A. With Option 4B, southbound overpass construction traffic

management and construction area requirements dictate that modification of the original Option 4 alignment would be required. This modification will be recognized with a 15 to 20 foot easterly shift in the northbound alignment corridor alignment. The new right of way line for this option would be shifted to a point 112 feet or 79 feet east of the current State Highway Layouts south and north of Boardman Street, respectively.

Future construction of a southbound flyover in the Option 4B alignment would require property acquisition along the west side of the Route 1A corridor, primarily to facilitate construction of the southbound alignment and exit lanes.

Extending northerly, the Tomasello Drive/Route 1A intersection would consist of three northbound through lanes and a right turn only lane to the Project site. Southbound, the two-lane section at the existing Jughandle has been maintained with two left turn lanes developed at Tomasello Drive to allow for an entering movement to the Project site. Exiting the Project, the current roadway configuration shows three lanes exiting to the left and one to the right. The three lanes are being provided to allow maximization of green time for the Route 1A movements. No changes, other than the extension of the three lane northbound section (and tapers to the existing two-lane corridor to the north), and traffic control signal upgrades to allow system development, are proposed in the area of the Jughandle signal.

Option 4B would require approximately 33 months to complete.

Operation of the surface roadway traffic control signal is forecast at LOS D or better on an overall intersection basis through the 2032 design year, even without construction of the southbound overpass. Utilizing Synchro 7, Tables 5-23 (A, B & C) summarize LOS by approach for Weekday morning, Friday evening, and Saturday afternoon peak hours, respectively, during each of the three Design Years reviewed for the intersections associated with the Option 4 Series.

5.5.4 Option 8 – Northbound Flyover Constructed within Existing NB Travel Way, C/D Fully to East (Southbound flyover later by others)

It should be noted that Option 7 is presented in the next section (5.5.5), after Option 8, because Option 7 actually builds upon Option 8. Also, this option as presented demonstrates the feasibility of constructing a southbound flyover at a later date.

Option 8 is similar to Option 4 except that the northbound flyover is constructed within the existing northbound corridor with the parallel movement from Boardman Street to Waldemar Avenue on the east side of the overpass (against the embankment). The northbound exit and entrance are to the right of the overpass, which eliminates the need for signal control at Waldemar Avenue and provides the first northbound control point at Tomasello Drive. Option 8, shown with both a northbound and southbound flyover at Boardman Street, is illustrated in Figure 5-22D.

While Option 8 illustrates both a northbound and southbound overpass, in light of findings associated with the operational analysis, only the northbound overpass would be constructed with surface improvements to Route 1A southbound in conjunction with the Project. When needed, the southbound overpass (which would require additional right of way on the west side of the corridor) and southbound surface roadway could be constructed in the future by parties other than the Proponent.

Structure profile and length are generally consistent with the Option 4 alignment. The easterly extent of work associated with the Option 8 alignment requires establishment of the State Highway Layout line at a point approximately 96.5 feet east of the current line between Boardman Street and Waldemar Avenue. (South of Boardman Street, the extent of relocation of the line is reduced when compared with Option 4 needs.) This is driven by the construction sequence and timing of completion for corridor improvements compared with the schedule of construction and opening opportunity for the Project. The initial construction activity in this Option would include development of the northbound surface corridor adjacent to the existing northbound Route 1A travel way. This would be followed by a second construction stage: construction of the northbound overpass.

Construction of the southbound overpass, when required, would begin with a shift of the southbound through movement to the northbound overpass (and provision of turning lanes at the Boardman Street intersection) while construction of the southbound overpass proceeds. Work during this stage would also include wall construction along the west side of Route 1A and the acquisition of property necessary to shift the southbound surface corridor westerly to allow for overpass construction. Once completed, the southbound collector distributor corridor would be completed as well as the final northbound collector distributor alignment.

While the proposal would be to construct only the northbound flyover and northbound collector/distributor system initially (estimated at 24 to 26 months duration), an overall 40-month construction schedule (or some greater period of time allowing for construction of southbound lanes when eventually needed) would be required to construct the entire Option 8. The overall construction sequence would require an at-grade signal-controlled operation of the northbound corridor after the Resort opens.

In previous submissions to MassDOT, assuming a surface-only operation at Boardman Street, the need for four northbound through lanes (plus a fifth lane for left turns) was identified based on managing existing demands and additional traffic associated with full Project occupancy. The southbound corridor would be widened to three lanes plus the left turn lane, and Boardman Street widened to three approach lanes. This four lane northbound surface road and sidewalk drives the location of a retaining wall to be built into the embankment between Boardman Street and Waldemar Avenue, which in turn drives the height of the wall required, now estimated at a minimum of 35 feet exposed. Additional coordination with the hotel development at the southeast corner of Route 1A and Boardman Street and, in particular, plans for Boardman Street at this location, would be necessary.

The northerly limit of work would also be extended to include additional property acquisition requirements in Revere. With the first control point at Tomasello Drive, the Route 1A northbound corridor separation between the overpass movement and frontage road would require extension to that control point, prohibiting movement from the overpass to the Project driveway at Tomasello Drive. All northbound traffic approaching the Project from the south would have to use the collector/distributor system.

In the final configuration, the northbound collector/distributor system could be reduced to four lanes approaching Boardman Street (one left, one right and two through), with two lanes continuing to Tomasello Drive where a right-only lane and a single through lane would be provided. The three northbound through lanes (two on the west and one to the east of the median) would run simultaneously and continue northerly, tapering through the Jughandle area. The extent of lane drops would extend north of the anticipated limit of Option 4, and the additional width associated with the median would extend the needed property acquisition further north than required under Option 4.

It is worth noting that, while three lanes are provided for the northbound movement, the two lanes left of the separating median would bear more than 90% of the projected demand during the evening peak. The rightmost lane would see only the right turn demand from Boardman Street and the right turn from Waldemar Avenue.

Estimated construction time for Option 8 (northbound flyover, northbound collector distributor, southbound and Boardman Street at-grade surface widening only, with southbound flyover constructed as a separate project) is estimated as 24 to 26 months. In the case that northbound and southbound flyovers where constructed as a single project, then the full construction period would be estimated to take 40 months.

Operation of this alternative, assuming only a northbound overpass and southbound surface road, is consistent with results reported for Option 4. The northbound C/D corridor shows a slight degradation in LOS with the addition of all Route 1A Resort-destined traffic to the signal controlled surface road, even with the addition of a second through lane. An LOS degradation is also experienced at the Route 1A/Tomasello Drive intersection, where the primary northbound overpass through movement is concentrated in two lanes.

Using Synchro 7, Tables 5-24 (A, B & C) summarize LOS by approach for Weekday morning, Friday evening, and Saturday afternoon peak hours, respectively, during each of the three Design Years reviewed for intersections associated with Option 8.

5.5.5 Option 7 – Multiple Flyover Alternative at Boardman and Tomasello/Jughandle (Southbound flyovers later by others)

This alternative builds on Option 8 with construction of additional northbound and southbound structures (later by others) for through movement over the proposed Project driveway and relocation of the Jughandle (or alternative turnaround movement) southerly to a point at or near Tomasello Drive. Given the addition of Resort-related traffic to the southbound C/D approaching Boardman Street, a two-lane through movement will be required in addition to the left turn lane to Boardman Street eastbound.

This option is presented to demonstrate the feasibility for constructing southbound flyovers at a later date. If constructed as part of the Project, structure work would include the northbound side only, with southbound surface modifications as needed. The basic

construction sequence would follow that described in Option 8, first constructing the northbound collector distributor, then the northbound flyover system, followed by the southbound and the completion of the northbound and southbound surface alignments.

Option 7 final conditions are depicted in Figure 5-22E. It should be noted that this plan illustrates the outer limits of land acquisitions that would be required to allow maintenance of traffic during construction, including a pedestrian walkway, although the temporary construction roadways are not shown.

The basic traffic maintenance plan would include three northbound through lanes north of Tomasello Drive, tapering to two lanes through the balance of the construction area and then returning to the existing two lane and shoulder section approaching the Route 145 overpass. These lanes would be separated from the general construction area by approximately 15 feet. This would impact the tank farm overhead piping systems adjacent to both sides of Route 1A, including one of the buildings associated with the system. The work also impacts multiple properties and additional wetland resources. The Jughandle movement would have to be relocated to the south early in the traffic maintenance plan process, impacting additional property on the westerly side of Route 1A. (The initial plan developed for this alternate maintained the existing Jughandle location with a work and impact limit extending an additional 300 to 400 feet north, with the same increase in length of structure.)

When needed, the southbound flyover system could be implemented following the procedure identified in Option 8: southbound through movement to the northbound lanes with the northbound movement returned to surface operation from south of Boardman Street through the northerly Project limit, allowing for construction in the southbound corridor. A single lane from the southbound movement would allow for movement to the Jughandle, Tomasello Drive, adjacent west side land uses, and Boardman Street.

Construction of the southbound flyovers would be achieved via a buffer area of at least 15 feet between this C/D movement and the westerly side of the southbound structure. On completion of the southbound structure, the C/D corridors both northbound and southbound would be completed.

While the proposal would be to construct only the northbound flyover at Boardman Street with the associated northbound collector distributor, southbound and Boardman Street at-grade surface widening (estimated at 24 to 26 months duration), an overall 58-month construction schedule (or some greater period of time allowing for construction of southbound lanes when eventually needed) would be required to construct the entire Option 7.

5.5.6 Option 11 – Modified At-Grade Alternative

This at-grade alternative is provided as the alternate to Option 1 that was developed early in the process of evaluating alternatives. Option 1 replaced the flyover solution in favor of a concept that maintained movements concentrated at the Route 1A/Boardman Street intersection with multi-phase traffic signal control (with one left and four through lanes northbound, one left and three through southbound, three lanes on the Boardman Street westbound approach and two lanes on the eastbound approach), and at a single concentrated intersection at Tomasello Drive. Option 11 builds on this concept and splits movements among various controlled points with two-phase signal control. This alternative design, while it fails to achieve grade separation at Boardman Street, a key feature of the flyover concept, recognizes the efficiency of two-phase signal operation (that is, addressing all traffic movements at the intersection in two signal phases) and the ability to provide fewer through lanes to handle greater demand.

The basic design, illustrated in Figure 5-22F, provides three lanes in each direction on Route 1A with the majority of improvements confined to within the existing State Highway Layout and most within the existing outside curb lines. At Boardman Street, three lanes would be provided both northbound and southbound. Direct left turns from Route 1A

southbound to Boardman Street would be prohibited and that traffic instead would proceed further south on Route 1A to a signal-controlled left exit into a jughandle to access the northbound lanes of Route 1A and Boardman Street.

Boardman Street westbound would be narrowed and realigned to the south, creating an approach angle consistent with needs for a smooth turning movement to Route 1A southbound. As with the previous option, this realignment would need to be evaluated for consistency with the hotel development at Boardman Street and Route 1A that has been approved. Left turns and right turns would be permitted from Boardman Street westbound. Eastbound Boardman Street would be retained in its current location but, with median installation on Route 1A, only right turns in and out would be permitted. Southbound left turn movement to Boardman Street would be displaced to the south and those motorists seeking to continue west of Boardman Street would instead travel south on Route 1A to a signal-controlled U-turn.

The plan is currently based on a median break and U-turn movement approximately 700 feet south of Boardman Street. At this point, U-turns would be signal controlled in both directions, requiring the introduction of a new full stop signal on Route 1A northbound to permit southbound traffic to execute the U-turn to access Route 1A north and, ultimately, Boardman Street. The U-turn would provide for all vehicles accessing Boardman Street eastbound off of Route 1A, those destined to Boardman Street or Route 1A northbound from the westerly leg of Boardman Street, and those accessing adjacent land uses on the easterly side of Route 1A between the turnaround and Boardman Street. Note that at this signal, only the northbound through movement and the southbound left turn would be controlled. The southbound through movement would be in a free flow condition.

At Boardman Street, two-phase operation would provide northbound and southbound Route 1A as Phase 1, and Boardman Street movement as Phase 2. The southbound Route 1A approach would be stopped north of the Boardman Street eastbound approach to allow vehicles to exit and store at the median break stop line. A pedestrian crossing would be provided on the northerly side of the primary intersection across the full width of Route 1A. The northerly control point would be in the vicinity of Tomasello Drive, with the Jughandle signal and turnaround point being maintained. At Tomasello Drive, the entering and exiting movements to the site will be treated in corridors separated by approximately 200 feet, versus the 60-foot separation in the current site access driveway configuration. The two-phase operation at this location would include Route 1A northbound and southbound during phase 1 and the Resort entrance and exit as phase 2. Internal to the site, a corridor would be established to allow U-turns from Route 1A northbound to southbound, providing for the replacement movement for the northbound left turn and U-turn currently permitted at Boardman Street, and for the movement from Waldemar Avenue. A pedestrian crossing could be incorporated on the northerly side of the exiting corridor intersection.

While the concept presents favorable traffic conditions in some areas, because it is based on maximizing the two-phase operation, this option presents a significant change in traffic patterns in several locations, including as follows:

- an additional signal is introduced onto Route 1A south of Boardman Street and the current signal for northbound traffic at Boardman Street is retained;
- motorists travelling south on Route 1A seeking to access Boardman Street eastbound are directed to the signal-controlled U-turn as described above; and
- Route 1A northbound traffic seeking to reverse direction (including traffic entering Route 1A northbound south of Boardman and from Waldemar) would exit Route 1A northbound at the Resort and use a Project-supplied U-turn at the entrance to the Resort.

Land acquisition is needed at the southerly turnaround for the realignment of Boardman Street westbound, and an expanded area from that parcel should the fourth northbound lane be provided, and potentially in the northeast quadrant of Waldemar Avenue and Route 1A northbound.

The construction schedule is estimated at approximately 16 months.

Using Synchro 7, Tables 5-26 (A, B & C) summarize LOS by approach for Weekday morning, Friday evening, and Saturday afternoon peak hours, respectively, during each of the three Design Years reviewed for the intersections associated with Option 11.

5.5.7 Option 12 – Left Turn Flyovers at Various Locations, all Through-Movements At-Grade

This series of alternatives could be implemented to remove left turns from the at-grade movement at various points along the Route 1A corridor. Given land use and space constraints west of the Route 1A corridor, only movements to and from the west are being considered for this Option.

Plans prepared at Boardman Street include the following:

- Elimination of left turn movement from Route 1A southbound to Boardman Street eastbound (see Figure 5-22G); and
- Removal of left turns from both Route 1A southbound to Boardman Street eastbound and from Boardman Street westbound to Route 1A southbound (see Figure 5-22H).

At Tomasello Drive, two alternatives have been developed, as follows:

- Elimination of the Route 1A southbound left to Tomasello Drive (see Figure 5-22I); and
- Elimination of the left turn from Tomasello Drive to Route 1A southbound (see Figure 5-22J).

Each alternative is described below. Implementation timeframes have not been identified for the alternatives identified for this option.

Alternate 12-1, Route 1A to Boardman Street

The provision of this movement in an overpass condition would directly benefit the northbound Route 1A corridor during the evening peak condition with the removal of 160 to 200 vehicles from signal control at the intersection (Friday afternoon peak condition) dependent on the design year. Three at-grade through lanes would be required in each direction on Route 1A (with a fourth northbound lane required for left turns). No significant benefit would be derived in the southbound direction during the morning peak other than that associated with the proposed third lane; the capacity of that approach is controlled by the northbound left and Boardman Street movement, and the same holds true for the movement from Boardman Street during the morning peak. The proposed Boardman Street widening would be included as the improvement for this location.

Construction of this overpass, illustrated in Figure 5-22G, would be in the center of the Route 1A corridor, replacing the existing left turn lane and median and shifting into both the northbound and southbound left turn lanes. The corridor has been set as 20 feet in width and, with walls/parapets, a base footprint of 26 feet has been identified. Alternates

(not drawn) would shift the turn lane to either the north or south, impacting only one side of the corridor with respect to land acquisition. Three through lanes in each direction would parallel the left turn overpass. To construct the overpass, an area approximately 42 to 44 feet wide would be required in addition to maintaining the existing three lane section southbound (two through and a left only) and two lanes northbound north of Boardman Street. With maintenance of sidewalks on both sides, 20 feet of additional right-of-way would be required through the construction period. Upon completion, the overall width of the needed layout would be consistent with this 120-foot layout.

With grades in the Boardman Street corridor sloping down from Route 1A, the touchdown point of the lane using grades on the order of 7% to 8% extends to 1,000 feet from the Route 1A corridor. Given the approach angle and associated sight line restrictions, an extended area of two-lane eastbound operation would be included. Land acquisition in this corridor would extend over 54 feet and appears to impact the proposed building siting and access identified for the proposed hotel.

Using Synchro 7, Tables 5-27 (A, B & C) provide a summary of LOS for the remaining signal-controlled movements by approach for Weekday morning, Friday evening, and Saturday afternoon peak hours, respectively, during each of the three Design Years reviewed for the intersections associated with Option 12-1.

Alternate 12-2, Boardman Street Westbound to Route 1A Southbound Added

The addition of a flyover allowing either a reduction in, or elimination of, the left turn from Boardman Street westbound extends the overall operational improvement to the morning peak hour given the existing demand for the left turn movement (approximately 380 vehicles during the morning peak). A series of alignments for the addition of this movement have been considered and the alternative presented in Figure 5-22H maintains the centrally located southbound movement from Route 1. The on-movement to Route 1A southbound would continue westerly from the southbound-off, turning and fully crossing Route 1A

south and then merging with the Route 1A southbound flow via a right entering ramp. Alignment of the off-ramp will be established to discourage a through movement onto the northbound on-ramp from Boardman Street.

The need to maintain a left turn movement at either the intersection or improve/modify the geometry at the ramp/Boardman Street intersection is driven by needs of the Leyden Street corridor. This one-way westbound roadway intersects Boardman Street between Route 1A and the take-off point for Boardman Street access via the flyover. Given property impacts, it has been assumed that the left turn at Route 1A would be maintained, but that the demand would be reduced by 85% given use of the direct flyover ramp.

The two-way ramp would require a width of approximately 30 feet (two 11-foot lanes with four-foot shoulders on each side) and, with parapets added, the structure width would be 34 to 36 feet. At the intersection of the southbound off-ramp and the Boardman on-ramp, the southbound off-ramp would be stop sign controlled, requiring an expanded structure to provide adequate intersection sight distance unimpeded by parapet walls.

Route 1A north and south would be widened to three lanes in each direction with the northbound left turn lane maintained. The Boardman westbound approach would be maintained in its current two-lane configuration.

Using Synchro 7, Tables 5-28 (A, B & C) provide a summary of LOS for the remaining signal-controlled movements by approach for Weekday morning, Friday evening, and Saturday afternoon peak hours, respectively, during each of the three Design Years reviewed for the intersections associated with Option 12-2.

Alternate 12-3, Southbound Route 1A to Tomasello Drive

The provision of this movement would eliminate the left turn phase for movement into the Project site. Projections for the movement are less than the left turn into Boardman, and as part of all of the at-grade options, a double left turn is provided to minimize disruption to northbound Route 1A traffic demands.

The corridor lane and structure would be as described in the Alternate 12-1 program for Boardman Street. The length of the structure, illustrated in Figure 5-22I, would be considerably longer however, given the need to be fully elevated at the current Jughandle location. Construction staging would also be as described in terms of lane needs, structure width buffers, and pedestrian facilities, except that there is no need for a surface left turn lane at Tomasello Drive.

The 110- to 115-foot cross section needed for construction would extend northerly to impact the overhead oil distribution facilities located north of the Jughandle.

The surface streets are proposed as three lanes southbound (all through) and four lanes northbound (three through and a right only) to the Project site. Tables 5-29 (A, B & C) provide a summary of LOS for the remaining signal-controlled movements by approach for Weekday morning, Friday evening, and Saturday afternoon peak hours, respectively, during each of the three Design Years reviewed for the intersections associated with Option 12-3.

Alternate 12-4, Tomasello Drive to Route 1A Southbound

This overpass construction would have more beneficial impact on Route 1A/Tomasello Drive traffic operations than the previous left turn entering movement alternative. Corridor and overall structure size would be consistent with the one-way, one-lane operation associated with other Option 12 alternates. Movement from the Resort, illustrated in Figure 5-22J, would be taken over Route 1A fully, partially turning and then entering the Route 1A southbound corridor as an added lane approaching Boardman Street. The location of the on-ramp would restrict access to the left turn movement to Boardman Street eastbound, and establish a difficult weaving section for movement from the southbound Route 1A corridor to Boardman Street west of the corridor.

Much of the overpass could be constructed off the existing Route 1A travel way and would require acquisition of properties along the west side or Route 1A. Given grades on the site and the desire to provide a U-turn movement for Waldemar Avenue traffic, considerable impact to on-site wetlands is anticipated.

Route 1A southbound would remain a two lane through movement corridor and would not be controlled by traffic signals at Tomasello Drive, unless there is a desire to provide a pedestrian crossing at the site, which could easily be provided on the south side of the existing Jughandle location. The double left turn movement from Route 1A southbound to the site would be signal-controlled. Route 1A northbound would be three lanes in width, providing for two through lanes and a right only lane into the Project.

Using Synchro 7, Tables 5-30 (A, B & C) provide a summary of LOS for the remaining signal-controlled movements by approach for Weekday morning, Friday evening, and Saturday afternoon peak hours, respectively, during each of the three Design Years reviewed for the intersections associated with Option 12-4.

5.5.8 Option 13 – Boardman Street At-Grade, Reverse Jughandle and Relocation of Northbound Left Turns

With identification of a plan that will function with three vehicle phases, this at-grade alternative (shown in Figure 5-22K) looks to strike a balance between the four vehicle phase Option 1 and the two vehicle phase Option 11. Left turn movements have been prohibited directly at the intersection; instead, northbound vehicles would be permitted to turn left (and U-turn) approximately 300 feet south of Boardman Street and, for those with destinations on Boardman Street west of Route 1A, connect to a private access and utility easement area (that would become a public way) via a new 75- to 100-foot-long roadway. Southbound vehicles would continue southerly through the signal to this new connector roadway (a travel distance of approximately 400 feet from the existing left turn lane), turn

right and then complete the movement to eastbound Boardman Street or back to Route 1A northbound via the Boardman Street eastbound corridor, passing through the signal again as a through movement or left turn.

Basic findings associated with this design include the need to widen the westerly leg of Boardman Street to three approach lanes from the access/utility easement corridor to Route 1A in addition to the widening to three lanes on the easterly approach. The alignment eastbound will also require a widening on the departure side of Boardman Street eastbound to accommodate the two approach lanes. On Route 1A, four northbound through/right turn lanes are required in addition to the three southbound through/right turn lanes approaching Boardman Street. Note that a fourth southbound lane is developed just south of Boardman Street to remove the right turn movement to the new connector from the through travel lanes. Northbound and southbound Route 1A operate in one vehicle phase at Boardman Street, followed by split phase operation on the Boardman Street approaches.

The northbound left turn movement would also be signal-controlled, operating during the Boardman Street eastbound phase (after a southbound internal clearance phase). Note at this latter location, northbound through movement would be permitted at all times.

Widening of the Route 1A corridor has again been maintained only on the northbound side except for the development of the short right turn lane between Boardman Street and the connector. Land acquisition needs are reduced (when compared with Option 1) along the easterly side of Route 1A given the reduction in median width associated with the elimination of the left turn lane. However, the widening in the Boardman Street corridor west of Route 1A, construction of the connector, and inclusion of the Access/Utility easement area within the public right of way add the need for land acquisition in the southwest quadrant of the intersection.

Tables 5-31 (A, B & C) provide a summary of operations based on Synchro 7 analysis for the Weekday morning, Friday evening, and Saturday afternoon peak hours, respectively, based on the 2012 and Resort build 2022 and 2032 volume conditions.

The construction schedule is estimated at 18 months. Basic construction staging would first include widening of the northbound corridor and construction in the northbound median at the proposed left turn point together with the connector and upgrades to the Access/Utility easement corridor and Boardman Street. Traffic would be put in its final alignment and then the southbound side of Route 1A would be modified to the three lanes southbound.

5.5.9 Alternatives Analysis Evaluation Criteria

As part of the alternatives comparison, a series of criteria to be considered in the evaluation has been developed. Given the nature of the Project and the basic requirements that will be the responsibility of the Proponent, higher scores should be afforded to those options that best meet the criteria identified.

The three base overpass conditions (Options 4, 7, and 8) are all predicated on provision of the northbound overpass and southbound surface improvements in the Resort's implementation phase. The southbound land acquisition required is generally consistent amongst all three, and therefore the southbound side land requirements have not been built into the comparative review.

The following is a summary of proposed evaluation criteria.

- **Neighborhood/community preference**. Since the flyover solution (Option 4) has formed the basis of the Proponent's outreach, has been supported by the Proponent in multiple public forums, has been under consideration for many years and enjoys broad public support, grade separation would carry the higher scores.

- **Construction duration and overall constructability including traffic management during construction**. Full implementation of the improvement would be anticipated as a requirement of site occupancy and operation. Note that the on-site construction duration for the Project is estimated at 26 months. Options with a longer estimated construction duration, unless accompanied by detailed a traffic

maintenance plan that maintains LOS during construction, would be given a lower score. Options that could be completed within this timeframe would be given a higher score.

- **Interference with Route 1A through traffic.** Options which eliminate signal control, particularly at key intersections in favor of assisting with the free flow of traffic are favored. Overpasses increase the capacity of a roadway by allowing uninterrupted flow in all directions. Fewer signals are therefore required to direct traffic, eliminating the queues caused by signals. Options that assist in accomplishing these objectives would score higher than those that do not.

- **Land impacts**. Because required land acquisition for implementation of the improvement is viewed as the Proponent's responsibility, the area in square feet, the number of abutters from which land would need to be acquired, and the current land holder (public/private/institutional) will all be recognized. Constructability issues and needs during construction that exceed the final width of corridors needed will be accounted for in this item. The greater the land impact, the lower the score.

- **Accommodation of all traffic movements within the highway right of way**. One overall goal of highway design is to control all traffic movements within the established right of way. Options that accommodate all turning movements within the proposed state highway layout (or on a nearby City street) rather than relying on the use of the private Resort driveway for access would be favored over those that cannot accommodate this feature.

- **Equitable treatment of all users.** In any evaluation of alternatives, there is always the risk that some users' driving experience will improve dramatically while other users will experience significant impacts to their current use of the roadway. Alternatives must recognize that, while Route 1A is a key regional asset and a state highway, it is intersected by local roads under the control of the City of Boston and the City of Revere and relied on every day by those users. Options that take into consideration all driving experiences will score higher than those that do not.

- **Safety.** All highway projects have safety as a key factor in determining eligibility and priority. Grade separation projects increase roadway safety by reducing vehicle-vehicle and vehicle-pedestrian conflicts on the roadway. The American Association of State Highway and Transportation Officials (AASHTO) *Highway Safety Manual* reports that converting an at-grade, four-leg intersection to a grade-separated interchange reduces injury crashes by 57 percent. While results vary based on a host of factors, it has also been reported that converting a signalized intersection into a grade-separated interchange reduces injury crashes by 28 percent. Designs that accommodate these objectives would score higher than at-grade solutions.

- **Level of Service**. A qualitative assessment of LOS and overall delay associated with general operation recognizing morning, evening, and Saturday peaks and the ability of each of the options to mitigate the site's impact is considered. In some cases, such as the elimination of the delay entirely or removal of signal control, the impact can be entirely mitigated. Better operation provides a higher score.

- **Environmental impacts recognizing wetlands and Chapter 91 land issues, along with land damages (such as elimination of green space adjacent to the right of way.** The Proponent has limited ability to fill wetlands and, because Route 1A improvements are being carried out as part of the Project, overall site impact to wetlands must include the area impacted by the access plan. Fewer potential impacts result in a higher score.

5.6 Host Community Agreement Traffic and Safety Improvements

As part of discussions for the HCAs and Surrounding Community Agreements to be executed by the Proponent, the cities of Revere and Chelsea have asked that existing regional traffic and safety issues along the Route 60 and Route 1 corridors be addressed by providing improved all-movement connections between Route 1 and Route 16. In response, conceptual plans for new ramp connections at the Route 1/Route 16 interchange and improvements along the Revere Beach Parkway corridor are included in the City of Revere HCA. The Route 1/Route 16 ramp connections would be supported by additional improvements at the Route 16/Route 145 Revere Beach Parkway intersection at Harris Street.

These improvements, which are consistent with the Boston MPO's Lower North Shore Transportation Improvement Study (prepared by the Central Transportation Planning Staff for the Massachusetts Highway Department in October 2000), and the recommendations contained in CTPS's 2004 Congestion Management System Report, are expected to shift some regional traffic from the Route 60 corridor to Route 1/Route 16.

Such strategic new connections could address long-standing regional traffic issues in the Cities of Revere and Chelsea along the Route 60 corridor through Brown Circle and Bell (Mahoney) Circle, as well as along Route 16/Revere Beach Parkway between Webster Avenue and the split to Route 145. Also, many of the trips using the new ramp connections will be diverted from the Route 16/Webster Avenue/Garfield Avenue intersection which currently provides a tenuous, unsafe U-turn alternative to using the Route 60 corridor. As these improvements are intended to address a pre-existing regional traffic problem independent of the Project, some Project-related trips would be expected to be similarly shifted from the Route 60 corridor.

As part of the Boston HCA, the City of Boston also identified locations in Revere that would complement improvements in East Boston and reinforce the regional benefits associated with proposed improvements in the Revere Beach Parkway (Route 16/Route 145) corridor.

The following sections describe the roadway, traffic, safety, bicycle, and pedestrian improvements committed to in the both the Boston and Revere HCAs, other than the Route 1A infrastructure improvements discussed in Section 5.5. All of the improvements and costs identified are based on the assumption that the needed right of way to make the improvements can be made available and that the Proponent will not need to make any additional right of way acquisitions. For each location, the relevant state and/or city agency having control and jurisdiction is identified; the Proponent will continue to work with these agencies, where appropriate, to further develop concept plans and advance permitting and design of the improvements or studies.

Both the Boston and Revere HCAs assume that the flyover solution (Option 4) will be the preferred alternative. Under that alternative, the proposed on-grade widening of Route 1A from Boardman Street to the Jughandle will be completed prior to the opening of any element of the Project. The Route 1A flyover will be completed prior to completion of the full build-out of the Resort. The Route 1A feasibility study, Bennington Street/Saratoga Street, improvements at Boardman Street/Ashley Street, and Boardman Street/Saratoga Street improvements will be completed prior to the opening of any element of the Project. Improvements to Mahoney (Bell) Circle, Brown Circle, and Route 60/Revere Street will be funded but not constructed by the Proponent as described in the Revere HCA. Remaining improvements (i.e., Neptune Road/Chelsea Street to northbound ramp, and Curtis Avenue/Route 1A) will be completed post-Project completion. Improvements in Revere will be completed in accordance with the City of Revere HCA.

5.6.1 Revere Beach Parkway Corridor

5.6.1.1 Route 1 at Route 16

This improvement, which requires DCR, MassDOT, and Cities of Revere and Chelsea approval, is intended to provide missing movements to an important regional highway access point. Under existing conditions, access from Route 1 southbound to Route 16 eastbound and from Route 16 westbound to Route 1 northbound are not provided. While there is redundant ramp access from Route 16 westbound to Route 1 southbound provided less than 1,500 feet from the existing interchange, or approximately 600 feet west of Webster Avenue, MassDOT has requested that this ramp be retained to maximize traffic operations on Route 16, and not introduce additional traffic into an already constrained weaving area.

Two alternate concepts for the improvement are presented in Figures 5-23A and 5-23B, although operationally they are the same. The former concept uses a part of the existing roadway median to create a left-turn lane for westbound traffic accessing the ramp to Route 1 north. The latter concept limits the impact to a short break in the median by shifting the westbound travel lanes within the right of way through the use of the existing hard shoulder.

Under either concept, the current on/off ramp configuration to and from Route 1 southbound would become a four lane off ramp to Route 16 east and west with a median break on Route 16 and installation of a traffic signal. This ramp will provide the opportunity to significantly reduce left lane and left/U-turn congestion at the Route 16/Webster Avenue intersection. The on-ramp to Route 1 northbound from Route 16 westbound would be developed with a second Route 16 median break on the easterly side of Route 1 supported by a 300- to 400-foot left turn lane. The left turn movement to Route 1 northbound would be signal-controlled and would tie into the existing eastbound to northbound loop ramp through an open infield area.

Both signals would operate in two phases (Route 16 east and west and the Route 1 southbound off at the off-ramp location, and the eastbound through and westbound left to Route 1 northbound at the new on-ramp location). It should be noted that there would be no stopping of the westbound through movement at the proposed signal to the northbound on-ramp movement. The interchange work would also include an update of the Route 16/Webster Avenue/Garfield Avenue intersection, and pavement area reduction where acceleration lanes are no longer required. The plan would provide an important safety improvement by virtue of the significant reduction in the existing dangerous weave and U-turn movements at this location. All work would be confined to the current right of way limits.

Initial review of the model output with the ramp added suggested a high demand for the movements being added. Initial traffic diversions indicated by the model include the following:

- During the Friday evening peak period, the projected movement from Route 1 south to Route 16 east is 300 vehicles. (The base CTPS model demand suggests a volume as high as 900 for this movement but the basis of the model also shows wide disparities between existing roadway demands – counted versus projected.) The left turn movement from Route 16 west to Route 1 north has been projected at 600 vehicles (also projected as high as 900 vehicles). The primary contributors to this demand are two primary corridors: the Route 107 corridor through Revere, which will see a decrease in overall demand, and the Winthrop Avenue corridor, which will be served by a left turn from Route 145 westbound to Route 16 west. The later movement is viewed as a capacity-constrained movement given conditions within the Route 145/Route 16 intersection which is discussed in the following section as a location which will also be improved.

- During the morning peak hour, the use of the new off-ramp movement from southbound to eastbound is projected to be as high as 900, although the actual projection for use of the ramp is shown to be less than 500 vehicles, recognizing existing vehicle patterns at the Webster Street intersection. The Proponent is currently continuing its evaluation of ramp demands, understanding that benefits associated with its addition can be effectively managed within the Route 16 corridor

and that there are significant benefits achieved at the Route 16/Webster Avenue/Garfield Avenue intersection. The on-ramp demand is expected to be 400 to 500 vehicles per hour. The model projection is as high 700 vehicles per hour, but again, this value appears to be high given the comparison in the base conditions with the model and actual field operations and observations.

- Addition of the ramps appears to show traffic diversions in various corridors including Webster Avenue between Route 16 and Chelsea Street, and along the Route 1 corridor itself. The magnitude of the changes vary considerably by corridor and within those corridors and include both the Route 1A and Route 16 approaches to Mahoney (Bell) Circle, extending northerly through the Route 60 corridor to Copeland Circle where the evening peak period demand (3 hours) suggests a volume reduction of between 500 to 750 vehicles (total both directions). This would be equivalent to 200 to 250 vehicles per hour.

The review of these initial data and analysis will be continued in coordination with MassDOT and CTPS.

It should be noted that the volume decreases associated with construction of the ramps have not been applied outside the immediate area of the ramp construction area itself. For example, base volumes assumed within Mahoney (Bell) Circle have not been adjusted even though there appears to be merit in doing so and due to the fact that the addition of these ramps will most certainly assist with Route 1A and Route 60 traffic volumes.

5.6.1.2 Route 1/Route 16 Long Range Plan

In addition to the physical improvement described above, the Proponent will fund a study of potential additional future Route 1 and Route 16 interchange improvements, consistent with long-range plans for interchange developed in the North Shore Transportation Study by CTPS which identifies a direct ramp connection from Route 16 westbound to Route 1 northbound. The following elements will be included in this study, which will be performed in coordination with state and municipal agencies:

- a study of the Route 1/Route 16 interchange for the purpose of planning additional improvements unrelated to the Route 1/Route 16 Intermediate Improvements;

- identification of costs associated with acquisition of property for right of way purposes as may be necessary to construct a direct access ramp from Route 16 westbound to Route 1 northbound; and

- the conceptual design of such a direct access ramp, but not including a full review of the environmental planning process or final design plans.

5.6.1.3 Route 16, Route 145, Harris Street

A series of improvement alternatives have been developed for this location requiring DCR, City of Revere, and potentially MassDOT approval (see Figures 5-24A, 5-24B and 5-24C). The alternatives are distinguished by the following treatments for Harris Avenue:

- maintain Harris Street as a two-way corridor;
- change two-way Harris Street to one-way away from Winthrop Avenue or one-way to Winthrop Avenue; and
- full closure of Harris Street at the intersection coupled with construction of a left turn lane on the Mahoney (Bell) Circle to Route 16 Connector south-westbound.

Common elements of each concept include the following:

- an optimal traffic signal timing and phasing plan, including split phasing;
- two exclusive right turn lanes eastbound onto Revere Beach Parkway;
- an associated widening of Route 16 EB to maintain the two-lane through movement toward Mahoney (Bell) Circle;
- pedestrian phasing, not provided under existing conditions;
- pedestrian safety improvements to allow for safe pedestrian routes from Winthrop Avenue to Revere Beach Parkway in both eastbound and westbound directions, including associated sidewalk reconstruction, curb ramps, crosswalks and median improvements; and
- Installation of an emergency vehicle preemption system.

5.6.1.4 Winthrop Avenue/Revere Beach Parkway at North Shore Road and Tomasello Drive

This intersection, which will require DCR, City of Revere, and MassDOT approvals, is an important access to the Resort. Intersection improvements, shown in Figure 5-25, are limited by a series of environmental concerns west of the intersection and constrained geometry to the north. Improvements under consideration include updating signal operation with split phasing to accommodate increased traffic movements associated with the Project, concurrent pedestrian phasing, provision of a missing crosswalk on Winthrop Avenue east of Tomasello Drive, minor realignments within the right-of-way, and construction of an island in the southwest quadrant allowing for pedestrian protection. An emergency vehicle preemption system will also be installed.

5.6.2 Specific City of Revere Locations

5.6.2.1 Mahoney Circle (Bell Circle)

Specific geometric improvements to be funded by the Proponent and constructed by others in accordance with the Revere HCA, subject to MassDOT approval, are presented in Figure 5-26. The localized widening at the northbound through movement to Route 1A north will enable vehicles to access those lanes more easily, increasing the effective storage capacity and improving throughput at the traffic signal. Analysis of this improvement is presented in Section 5.7.3.

Other basic improvements to pedestrian accommodations and general traffic operations, again subject to approval of MassDOT, include the following:

- Design and implementation of a comprehensive upgrade of the signs and pavement markings approaching and within Mahoney Circle, consistent with MUTCD standards, to improve motorist and pedestrian guidance and safety;
- Installation of ADA accessible ramps and associated sidewalk and median improvements within and around Mahoney Circle;
- Add pedestrian crossings to provide a Route 60 crossing on the north side of the circle, recognizing a high desire for the movements especially during school entrance and release periods;
- Design and installation of channelization and signalization improvements within and around Mahoney Circle;
- Construction of upgrades to traffic islands within Mahoney Circle, including new curbing and landscaping; and
- Installation of an emergency vehicle preemption system.

5.6.2.2 Brown Circle

Improvements at the intersection of Routes 60 and 107, to be funded by the Proponent and constructed by others in accordance with the Revere HCA, include the following:

- Design and implementation of a comprehensive upgrade of signs and pavement markings approaching and within Brown Circle, consistent with MUTCD standards, to improve motorist and pedestrian guidance and safety;
- Installation of ADA accessible ramps and associated sidewalk and median improvements within and around Brown Circle;

- Design and implementation of channelization and signalization improvements, including new pavement and directional markings and channelization islands, at the Route 107 northbound approach to Brown Circle;

- Construction of geometric and channelization improvements by extending existing islands and installing new islands to facilitate safer traffic flow; and

- Installation of an emergency vehicle preemption system.

A concept plan is included in Attachment A. Approval will be required from MassDOT and the City of Revere.

5.6.2.3 Route 60 at Revere Street

Intersection improvements proposed for this location, to be funded by the Proponent and constructed by others in accordance with the Revere HCA, include the following:

- Design and implementation of an optimal traffic signal timing and phasing plan at the intersection, including split phasing;

- Construction of pedestrian safety improvements including new crosswalks and ADA accessible ramps with associated sidewalk reconstruction; and

- Installation of an emergency vehicle preemption system.

A concept plan is included in Attachment A. Approval will be required from MassDOT and the City of Revere. Approval by the MBTA may also be required.

5.6.2.4 Donnelly Square (Bennington Street at Winthrop Avenue), including Bennington Street at Crescent Avenue

This signal-controlled intersection is adjacent to the MBTA Beachmont Station. The base improvement assumed for this site includes a signal upgrade using concurrent pedestrian crossings, extension of the Bennington Street median to the south to better control the prohibited left turn movement to a retail parking lot, and realignment of the Crescent Street approach to better manage the Bennington Street approach to Winthrop Avenue. Specific components include the following:

- Design and implementation of an optimal traffic signal timing and phasing plan, including split phasing, for the weekday morning, weekday evening, and Saturday midday peak periods;

- Redesign of the intersection to channelize traffic flow on the intersection approaches;

- Construction of permanent pedestrian crosswalks with new ADA accessible ramps at all crosswalks within the Donnelly Square area;

- Construction of aesthetic improvements within the Donnelly Square area, including new pavement markings;

- Construction of landscaping improvements within the Donnelly Square area and along Winthrop Avenue leading to the Project entrance at Revere Beach Parkway and Tomasello Drive; and

- Installation of an emergency vehicle preemption system.

A concept plan is included in Attachment A. Approval will be required from MassDOT and the City of Revere, and recognition of the MBTA as a potential stakeholder will be required.

5.6.3 Specific City of Boston Locations

5.6.3.1 Bennington Street at Saratoga Street

The base design used for improvements at this location is to improve pedestrian conditions and to upgrade signal operations. At the intersection, installation of a traffic island in the southwest quadrant and redirection of crosswalks for both the Bennington and Saratoga crossings is proposed, providing a compliant curb ramp for the Bennington Street cross in the southeast quadrant, lane use changes on the northbound Bennington Street approach (one right only and one through left), and median removal and median removal/relocation on the northerly leg of Bennington Street to allow a three lane southbound approach (two through and one left), with one through lane northbound. Signal phasing modifications are also proposed with minor support relocations.

As part of this intersection work, improvements will be made to the Saratoga Street pedestrian crossing in the Barnes Avenue, Bayswater Street triangle area to provide a pedestrian warning beacon system and compliant crossing ramps.

A concept plan is included in Attachment A. Approvals will be required from BTD and the Public Improvement Commission (PIC), and additional neighborhood outreach is required.

5.6.3.2 Boardman Street at Saratoga Street

The basic concept of a traffic circle will be maintained within this intersection with the 11-year-old geometry upgraded to a more standard roundabout design. The circle diameter would be increased and splitter islands added where roadway widths permit. The curb line along the easterly side of Saratoga Street would be modified to significantly reduce the pavement area, and the reclaimed roadway would be used for parking adjacent to the Saratoga Street residences. Pedestrian crossings would be relocated and generally pass through the splitter islands where available.

A concept plan is included in Attachment A. Approvals will be required from BTD and the PIC, and additional neighborhood outreach is required.

5.6.3.3 Chelsea Street Corridor from Neptune Road to Frankfort Street

This corridor has been split in two areas for the proposed improvement plan. The westerly section extends from Chelsea Street to Bremen Street, and the easterly section extends from Bremen Street to Frankfort Street. Concept plans are included in the Transportation Attachment A.

Within the westerly section, the plan would create a one-way couplet with Saratoga Street providing a one-way southbound corridor from Bremen Street to Neptune Road and Bremen Street one way northbound from Neptune Road to Saratoga Street. The curb line on the southeast corner of Chelsea Street and Saratoga Street would be modified (pavement area reduced) and a median would be added on Neptune Road from Chelsea Street to Bremen Street where two lanes would be provided: one left turn, and one lane continuing to Bennington Street. Based on traffic count evaluation, the plan would provide stop control on Neptune Road only or multi-way stop control on all approaches. Given geometric concerns and heavy truck activity, traffic signal control is not a viable option. Approvals will be required from BTD and PIC, and additional neighborhood outreach is required.

The plan developed for the easterly section of the Neptune Road corridor looks to increase capacity at the intersection by splitting the function of the overall intersection with the elimination of the westbound Neptune movement between the Route 1A northbound ramps and Bennington Street. All traffic from the ramp (except the U-turn to Route 1A southbound) and from Frankfort Street would be directed to Vienna Road and then allowed to access Bennington Street northbound and southbound via a new traffic signal and median break.

Removal of the westbound movement from the Bennington Street intersection will allow increased tome for the Bennington Street southbound phase, accommodating both the existing demand and the redirected movement from the closed link. Approvals are required from BTD/PIC, MassDOT, and Massport, and the improvements will be subject to additional neighborhood outreach.

5.6.3.4 Route 1A SB at Curtis Street

A proposal to realign Route 1A southbound has been developed in response to the improvement request for this intersection. A concept plan is included in Attachment A.

The realignment, subject to the approval of MassDOT, is intended to create an "exit" from Route 1A southbound to the Bennington Street and Curtis Street areas rather than the wide pavement area that currently exists. The relocation would be into a grass and tree area within the Route 1A median and provide for two continuous lanes for the southbound

through movement. An island would be created within the current paved area of the exiting movement and through movement. Movement from the newly created ramp would intersect with the Curtis Street movement under single or multi-way stop control (to be evaluated), and the movement from the Curtis Street corridor onto Route 1A southbound would be in a free-flow condition to the third lane available south of the interchange area.

The base design concept assumes that all work will be completed within the State Highway Layout and that, like other improvements described in this section, no right of way acquisition is necessary to make these improvements. Approvals will be required from MassDOT and BTD/PIC, and additional neighborhood outreach is required.

5.6.3.5 Route 1A Planning Study

The City of Boston has a long-standing concern about, and interest in, improving traffic flow along Route 1A from the south. In connection with such concerns, the Proponent will perform a feasibility study of various options available to improve traffic flow along Route 1A from the south.

5.6.3.6 Bennington Street Corridor "Constitution Beach to Revere Beach" Bicycle Connection

The Proponent will provide on-street bicycle accommodations along the Bennington Street corridor from Saratoga Street in East Boston to Winthrop Parkway in Revere.

The bicycle route will start at the northerly end of Constitution Beach Park, proceed northerly along Barnes Avenue (shared lanes) to Saratoga Street, and follow Saratoga Street easterly to Bennington Street (also as a shared lane given width limitations on Saratoga Street) over the MBTA Blue Line. From Saratoga Street to the Boston/Revere municipal boundary, a minimum five-foot-wide bicycle lane will be provided with one lane established for through movement northbound.

Parking will generally be permitted along the curb line, except approaching the Bennington Street, Leyden Street/Walley Street extended intersection area where two travel lanes will be designated, one for left turns and one for through movement. Within an area from 250 feet south of Leyden Street through Palermo Street, parking will be restricted. Parking restrictions and/or painted median area or two-way left turn lane will be considered from Leverett Avenue to the Boston/Revere municipal boundary. Southbound from the Revere/Boston municipal boundary to the Suffolk Downs Station, parking will be restricted (matching northbound). Southerly from the MBTA station, one travel lane will be maintained with on-street parking and the bicycle lane to an area between Ashley and Antrim Streets, where lane sharing will be provided to Saratoga Street.

In Revere, a three-lane corridor (one through/right lane in each direction with a two-way center left turn lane) would be provided, with parking on both sides at the curb and five-foot minimum turn lanes, from the City Line to Crescent Street. From Crescent Street to

Winthrop Avenue, lanes would be shared in both directions. From Winthrop Avenue to Winthrop Parkway, one travel lane would be removed, maintaining one travel lane, parking, and the bicycle lane.

Approvals will be required from BTD, the City of Revere, MassDOT, and DCR.

5.7 Traffic Operations Analysis

Capacity analyses were conducted for the Existing (2012), 2022 No-Build, 2022 Build, and 2022 Build with HCA Improvements conditions to determine how well the roadway facilities serve existing and future traffic demands. These roadway operating conditions are classified by the primary service measure of control delay in seconds per vehicle (sec/veh) and quantified LOS. Data are provided for all 30 intersections requested by MassDOT and the cities of Boston and Revere in the expanded regional study area, although the 2022 Build with HCA Improvements analysis is limited to a set of critical locations, as discussed Section 5.7.4.

While this evaluation presents an alternatives analysis of the Route 1A infrastructure improvements, the traffic analysis presented in this DEIR/EPNF is anchored on the flyover concept (Option 4) proposed in response to community concerns and presented publicly. Beyond the area of the Route 1A infrastructure improvements themselves (and the various operations issues that are unique to each option), the overall regional traffic impact analysis for the Project remains the same under any of the Route 1A options.

LOS is a qualitative measure of control delay at an intersection, providing an index to the operational qualities of a roadway or intersection. LOS designations range from A to F, with LOS A representing the best operating conditions and LOS F representing the worst operating conditions. The following sections present LOS analyses for the study area signalized intersections, unsignalized intersections, roundabouts, and interchange (merge/diverge sections).

5.7.1 Signalized and Unsignalized Intersections

LOS designation is reported differently for signalized and unsignalized locations. For signalized intersections, the analysis considers the operation of each lane or lane group entering the intersection and the LOS designation is for overall conditions at the intersection. For unsignalized intersections, however, the analysis assumes that traffic on the mainline is not affected by traffic on side streets. The LOS is only determined for left turns from the main street and all movements from the minor street. The LOS designation is for the most critical movement, which is most often the left turn out of the side street.

The evaluation criteria used for the LOS analysis are based on the *2000 Highway Capacity Manual* (HCM)[6]. Table 5-32 presents the LOS delay threshold criteria as defined in the HCM.

Synchro 7 software was used to model LOS operations at all signalized and unsignalized study area intersections. Overall intersection, as well as individual movement LOS and delay are provided for signalized intersections by Synchro. For unsignalized intersections, only the critical movement is reported.

Table 5-32 Level of Service Criteria for Signalized and Unsignalized Intersections

Level of Service	*Signalized Intersection Control Delay (sec/veh)*	*Unsignalized Intersection Control Delay (sec/veh)*
LOS A	≤ 10	0 - 10
LOS B	> 10-20	>10 - 15
LOS C	> 20-35	>15 - 25
LOS D	> 35-55	>25 - 35
LOS E	> 55-80	>35 - 50
LOS F	> 80	>50

Source: 2010 HCM

LOS results for signalized intersections for the Friday evening peak hour and the Saturday afternoon peak hour are presented in Tables 5-33 and 5-34, respectively, for all analysis scenarios. Synchro reports are included in Attachment A.

[6] 2000 Highway Capacity Manual, Transportation Research Board, Washington D.C. (2000).

1. Volume-to-capacity ratio.
2. Average delay of movement, expressed in seconds per vehicle.
3. Level of Service.
4. 50th percentile queue length in vehicles.
5. 95th percentile queue length in vehicles.

* Movement does not existing in that condition.
\# 95th percentile volume exceeds capacity, queue may be longer.
m Volume for 95th percentile queue is metered by upstream signal.
~ Volume exceeds capacity, queue is theoretically infinite.

25.	Route 1A (North Shore Road) at Wonderland Station	C	C	C	C	C	C
26.	Route 1A (North Shore Road) at Revere Street	F	F	F	F	F	F
27.	Route 60 (Squire Road) at Charger Street	C	D	D	C	D	D
28.	Route 60 (Squire Road) at Sigourney Street/ Mall Driveway	D	F	F	F	F	F

Intersections in urban areas are typically considered to be operating acceptably if the intersection is LOS D or better. While most intersections within the study area operate above this threshold, there are a few intersections operating at a LOS E or F during at least one analyzed scenario (unless indicated otherwise, the stated condition exists for all of the options considered). These include the following:

- Winthrop Avenue (Route 145) at North Shore Road during the Friday evening peak in the No-Build and Build conditions;
- Bennington Street at Saratoga Street during both the Friday evening and Saturday afternoon peaks in all conditions;
- Winthrop Avenue (Route 145) at Revere Beach Parkway (Route 16)/ Harris Street during the Friday evening peak in the Build condition;
- Route 16/Route 1A/Beach Street at Mahoney (Bell) Circle (South signal) during the Friday evening peak in all conditions and Saturday afternoon peak in the No-Build and Build conditions;
- Bennington Street at Neptune Road during both the Friday evening and Saturday afternoon peaks in all conditions;
- Revere Street at Route 60 during both the Friday evening and Saturday afternoon peaks in all conditions;
- Route 16 at Garfield Avenue/Webster Avenue during the Friday evening peak in all conditions and Saturday afternoon peak in the Build condition;
- Route 1A (North Shore Road) at Revere Street during both the Friday evening and Saturday afternoon peaks in all conditions; and
- Route 60 (Squire Road) at Sigourney Street/ Mall Driveway during the Friday evening peak in the No-Build and Build conditions and Saturday afternoon peak in all conditions.

The Project, with the Route 1A flyover solution (Option 4), is expected to have limited impact to the signalized study area intersections. The overall intersection LOS is expected to degrade during the Friday evening peak hour from the No-Build condition to the Build condition at Winthrop Avenue (Route 145) at Revere Beach Parkway (Route 16)/ Harris Street. Route 1A at Boardman Street and Route 1A at Jughandle are expected to have an LOS improvement in the Friday evening peak.

During the Saturday afternoon peak hour, the overall intersection LOS is expected to change at four signalized intersections (with Option 4): Route 1A at Boardman Street, Route 16/Route 1A/Beach Street at Bell Circle (South signal), Route 1A at Jughandle, and Route 16 at Garfield Avenue/Webster Avenue. Route 1A at Boardman Street and at the Jughandle, is expected to have an improvement in the overall intersection LOS.

LOS results for unsignalized intersections for the Friday evening peak hour and the Saturday afternoon peak hour are presented in Tables 5-36 and 5-37, respectively, for all analysis scenarios. Synchro reports are included in Attachment A.

During existing Friday evening and Saturday afternoon peak hour conditions, the currently illegal left-turn movement from Tomasello Drive onto Route 1A southbound, the right-turn movement from Furlong Drive onto Route 1A northbound, and the right-turn from Curtis Street onto Route 1A southbound are operating at a poor LOS (LOS E or F). With the Resort, the currently illegal left turn out of the Resort to Route 1A southbound will be signalized, resulting in a legal and safe left-turn movement experiencing increased capacity as shown previously in Table 5-36 and Table 5-37.

Currently, the right-turn movement from Furlong Drive onto Route 1A northbound is not exceeding capacity, but it is LOS E due to excessive delays for vehicles making that turn during the analyzed Friday and Saturday peak hours. Under Future No-Build and Build conditions, this movement will continue to experience these delays.

The right-turn movement from Curtis Street onto Route 1A southbound is currently experiencing long average vehicle delays. In future conditions, this movement will exceed its capacity and will continue to operate at LOS F. However, it should be noted that the Synchro methodology for unsignalized intersection does not account for gaps in traffic created by up-stream signals. Therefore, the analysis for all conditions over-estimates the delays experienced in practice.

Table 5-36 Unsignalized Intersection Capacity Analysis, Friday Evening Peak Hour

4. Level of Service.
5. 95th percentile queue length in vehicles.

5.7.2 Roundabout/Rotary Analysis

The Highway Capacity Manual defines the capacity of a facility as "the maximum hourly rate at which persons or vehicles can reasonably be expected to traverse a point or uniform section of a lane or roadway during a given time period under prevailing roadway, traffic, and control conditions." The general principal for the capacity of an approach to a roundabout considers the inverse relationship between capacity of the approach and conflicting internal flow. Conflicting flow is the circulating flow that passes directly in front of the individual approach. Sidra Intersection 5.1 software was used to model control delay and LOS operations at the three study area roundabouts.

Table 5-38 presents the LOS delay HCM threshold criteria for roundabouts/rotaries.

Table 5-38 Level of Service Criteria for Roundabouts/Rotaries

Level of Service	*Roundabout Control Delay (sec/veh)*
A	0 - 10
B	>10 - 15
C	>15 - 25
D	>25 - 35
E	>35 - 50
F	>50

Source: 2010 HCM

Overall roundabout, as well as individual approach LOS and delay, are reported for Friday evening and Saturday afternoon peak hours in Table 5-39 and 5-40, respectively. Sidra reports are included in Attachment A.

Based on 2010 *Highway Capacity Manual*.
1. Volume –Approach volume in vehicles per hour.
2. Delay – Average stopped delay in seconds per vehicle.
3. LOS – Level of Service rating.
4. 95th - 95th percentile queue length in vehicles.

Under all analyzed conditions, Eliot Circle performs at LOS D or better during Friday evening and Saturday afternoon peak hours. However, the northbound approach of Winthrop Parkway will operate at LOS F under Future conditions during the Friday evening peak. The northeast-bound Route 145 approach will operate at LOS B or better during both peak hour periods. The Project is anticipated to have negligible impacts at this location due to the minimal Project trips estimated to utilize this corridor.

During the existing Friday evening and Saturday afternoon peak hours, the recently redesigned Butler Circle operates at LOS C and LOS B, respectively. Under Future No-Build growth conditions (without the Project), the circle will be reduced to LOS E during the Friday evening peak hour and LOS C during the Saturday afternoon peak. Although only a small amount of Project trips are expect to use Butler Circle, the LOS will be further decreased to LOS F during the Friday evening peak period.

The LOS at Butler Circle is primarily controlled by the minor North Shore Road northbound approach. This approach operates at a LOS E or F during the Friday evening peak in all conditions and Saturday afternoon peak in the No-Build and Build conditions. This delay is due to the heavy internal volume within Butler Circle heading northbound on Route 1A which opposes the North Shore Road approach.

Currently all approaches to Brown Circle (Route 60/Route 107) operate at LOS F during the Friday evening and Saturday afternoon peak hours. Route 60 in particular is a heavily travelled roadway for commuters both locally and regionally as it connects Route 1 to the north at Copeland Circle. Under Future No-Build and Build conditions, Brown Circle will continue to operate with excessive delays for all approaches.

5.7.3 Merge/Weave Interchange Analysis

The analysis of weaving operations at exit ramps is based on procedures presented in the HCM. A weaving movement is defined as the interaction between the crossings of two or more traffic streams traveling in the same direction without the aid of traffic control devices. The measure of effectiveness to determine the LOS is based on many parameters, including density and the speed of both the weaving and non-weaving vehicles. The higher the speeds and lower the density, the better the operations of the weaving segment.

The analysis of merge operations at ramps is based on procedures presented in HCM Chapter 25, Ramps and Ramp Junctions. The procedure focuses on the interaction between freeway mainline through-traffic and traffic merging from or diverging to ramps. The analysis takes into account geometric and operational factors such as the length and taper of the acceleration/deceleration lanes, free-flow vehicle speed along the freeway and on the ramps themselves, and the number of vehicles in the right-most (or left-most for left exits) two lanes of the freeway. It should be noted that limitations in the HCM merge analysis methodology define the mainline as a freeway with a minimum input free flow speed of 55 miles/hour. This limitation affects the presented study area merge analyses as stated.

The focus of the analysis is at the ramp junction with the mainline where entering vehicles attempt to find gaps in the adjacent traffic stream. The action of this merging traffic creates vehicle turbulence along the mainline that can affect freeway operations. According to the HCM, the influence area for both of these movements is approximately 1,500 feet before

the diverge areas and beyond the merge areas (including acceleration and deceleration lanes). Table 5-41 summarizes the HCM criteria for LOS and densities for merge and diverge analyses.

Table 5-41 Level-of Service Criteria for Merge/Weave Segments

Level of Service	*Density Range(pc/mi/ln)[1]*
A	≤10
B	>10 - 20
C	>20 – 28
D	>28 – 35
E	>35
F	Demand exceeds capacity

Source: Highway Capacity Manual, Transportation Research Board, National Research Council, Washington, D.C., 2010.
1 Passenger cars per mile per lane.

Capacity analyses for Copeland Circle and the Route 1/Route 16 interchange were conducted utilizing Highway Capacity Software (HCS+) Version 6.3. As defined by the HCM, Copeland Circle operates as a series of three weave sections and three merge sections. Merge and Weave analysis HCS+ output is provided in Attachment A. Figures 5-27 and 5-28 show the location of each merge/weave section.

Friday evening and Saturday afternoon peak hour weave and merge capacity analyses for Copeland Circle are presented in Table 5-42 and Table 5-43, respectively.

Table 5-42 Operations Summary, Copeland Circle, Friday Evening Peak Hour

M7. Copeland w/ Route 1 SB	381	19.6	B	407	20.5	C	407	20.7	C

Based on 2010 *Highway Capacity Manual*,
1. Volume – Unadjusted weave segments demand or ramp volume in vehicles per hour.
2. Density – Expressed in passenger cars per mile per lane.
3. LOS – Level of Service rating.

N/A = Volume exceeds capacity, density could not be calculated
W = Weave Segment analysis; M = Ramp Merge analysis.

During existing and future Friday evening and Saturday afternoon peak hour conditions, almost all weaving segments within Copeland Circle are a LOS E. The HCM defines this state as "turbulence felt by virtually all drivers." The only exception to this is the Route 1 southbound weave with Route 60 in the Build condition during the Friday evening peak hour. This weave operates at LOS F due to the fact that the volume just exceeds the capacity at a v/c ratio of 1.02. The HCM defines LOS F as "ramp and freeway queues form".

The merge approach onto Route 1 northbound from Copeland Circle appears to function at LOS D during the Friday evening and LOS E during the Saturday afternoon peak hours. It should be noted, however, that due to limitations in the Sidra software, the program cannot accurately model the lane-drop along Route 1 that occurs directly south of this merge segment. Therefore, while this merge location is most likely failing during peak traffic hours, the output may not be representative of true conditions. While this merge segment is considered failing, the Project impact is anticipated to be an approximately one-second increase in delay during both peak hours.

The on-ramp to Route 1 southbound from Copeland Circle functions at an acceptable LOS B during Existing peak hour conditions. In the future this merge is expected to continue to operate at LOS B during the Friday evening peak hour and degrade slightly to a LOS C during the Saturday peak hour due to regional growth projections.

The merge approach (Route 60 westbound) functions at a reasonable LOS C during all analysis periods.

As defined by the HCM, the Route 1/Route 16 interchange operates as a series of three merge sections. It should be noted that the ramp connecting Route 1 southbound to Route 16 westbound is not defined as a merge segment by the HCM definition due to the control of a signal at its terminus (Webster Avenue). Friday evening and Saturday afternoon peak hour merge capacity analyses for the Route 1/16 Interchange are presented in Table 5-44 and Table 5-45, respectively.

Table 5-44 Operations Summary, Route 1/16 Interchange, Friday Evening Peak Hour

1. Volume – Unadjusted ramp volume in vehicles per hour.
2. Density – Expressed in passenger cars per mile per lane.
3. LOS – Level of Service rating.

M = Ramp Merge analysis.

During the existing and future Friday evening and Saturday afternoon peak hour conditions, all three merge segments within the Route 1/Route 16 interchange operate at acceptable densities and LOS according to the defined criteria, with or without the proposed Project. The merge segment with the poorest LOS connects Route 1 northbound to Route 16 eastbound and currently operates at a LOS C during the Friday evening peak hour. This segment is projected to continue to operate at the acceptable LOS C under Future conditions, with or without the Project.

5.7.4 Harbor Tunnel Operations

One of the MassDOT-requested scope items was evaluation of operations in the Ted Williams Tunnel eastbound. As noted previously, incomplete data are available to facilitate analysis. Given severe limitations on the existing system infrastructure, it has not been feasible to gain access to and count data for the critical multiple merge sections at the entry to the eastbound tunnel. The Proponent will work with MassDOT to seek solutions to obtain these data. However, following is a qualitative discussion of operations and a potential improvement concept for on-going discussion with MassDOT.

There are five primary feeds to the two lane eastbound tunnel, which during a Thursday or Friday afternoon peak carries approximately 3,000 vehicles:

1. The I-90 corridor itself, sometimes referred to as the extension tunnel (Seaport Access Highway) east of the I-93 corridor;

2. The ramp from I-93 northbound, which merges with the I-90 mainline east of the mainline exit to the Congress Street ramp in South Boston;

3. The South Boston local access and South Boston By-Pass Road/Massport Haul Road ramp;

4. The HOV lanes from I-93 northbound; and

5. The emergency on-ramp from the Traffic Operation Center and Police Barracks in South Boston.

It should be noted that #4 and #5 merge together and end at the tunnel portal where the corridor is actually three lanes wide, and following an acceleration lane and taper reduce to the two lane section within the tunnel.

General observation of demands and operations suggests that the tunnel operation is very much controlled by actual on-ramp merging demands and lane turbulence with much lane changing occurring in the immediate areas of the ramp, and that there is a general prioritization of movement into the tunnel based on the movement from ramps closer to the tunnel portal. The farther downstream a vehicle enters, the less delay associated with the entering movement given the tendency for vehicles to "alternate merge" under heavy flow condition. This is generally accompanied by vehicles upstream of the merge to move to the left lane, displacing "capacity" for vehicles already in the traffic stream. For example, there is very little delay (associated with the movement of an HOV or Traffic Operation Center or emergency vehicle using entrances #4 and #5 because they are entering east of where much of the vehicle merging and turbulence has been created. Each vehicle entering once inside the portal is only impacting the operation of the right lane and only for a limited period.

South Boston surface demand is competing for the two-lane capacity at its merge point with vehicles that have been in the system from both mainline I-90 and those that have entered from I-93 northbound. The demand to enter from South Boston is high, and the impact of the ramp operation shows queuing on the Bypass Road from the eastbound corridor itself and from the West Service Road Extension corridor that provides access from the Congress Street area and from the Massport Haul Road corridor approaching from the east including both the surface road and ramp from D Street components. The ramp enters the I-90 mainline as it is exiting from the extension tunnel into the boat section, and then merges to the two-lane section continuing to run parallel to the HOV lane.

I-93 demand merges well within the I-90 tunnel extension through a horizontal curve and functions generally well until downstream demand in the tunnel starts to cause the slow down which then leads to ramp turbulence and changes to the left lane.

With a goal of minimizing impact first to the I-90 corridor traffic from the east, a potential approach to manage operational issues is as follows:

1. Reduce the I-90 eastbound corridor to one lane east of the Congress Street off-ramp. This would involve a right lane closure with all vehicles moved to the left lane. It is anticipated that this single lane will have a carrying capacity of some 1,350 to 1,500 vph, which will be reviewed against the eastbound demand when available. From this point, the left lane is available only for vehicles that have entered the system from the I-90 eastbound corridor to several hundred feet within the Ted Williams Tunnel.

2. Allow I-93 northbound traffic to enter I-90 eastbound in its own lane (and start to allow use of both lanes in the eastbound extension tunnel at that point).

3. Merge the South Boston on-ramp movement into the right lane I-93 northbound traffic stream. Modify the length of the merge lane to its maximum available distance and then taper to a single lane closer to the merge of the HOV and Traffic Operation Center ramps.

These are suggestions only, made for the purpose of raising with MassDOT some possibilities for addressing the Ted Williams Tunnel demand and to recognize that the continual addition of surface traffic into the tunnel from the South Boston Seaport area that has been added since the tunnel opened in December 1995 is impacting daily tunnel performance. The concept of this approach, which may be expanded to include ramp metering in one or more corridors, can be validated when traffic volume data (morning, afternoon, and Saturday mid-day peaks) are available.

5.7.5 Critical Operational Analysis with HCA Improvements

A key objective of many of the roadway improvements under the HCAs is to provide operational, safety, bicycle, pedestrian, and ADA improvements, rather than necessarily improve intersection capacity. However, improvements proposed on Revere Beach Parkway are expected to have positive regional as well as local impacts that involve diverting traffic from the Route 60 corridor to the Route 1/Route 16 corridor. Therefore, it is important to evaluate the capacity of those intersection improvements to accommodate diverted traffic.

Forecasting trip diversions associated with new roadway connections requires the use of MassDOT's Regional Transportation Model (maintained by CTPS) and, when looking at local intersections, some interpretation of the model projections is necessary. Initial model projections indicate the general trends in trip redistribution on the roadway network, but more detailed analysis will be required in consultation with MassDOT.

A conservative approach has been adopted for the initial critical analyses under these HCA improvements. While relief to Route 60 is expected, reduction in traffic through the Route 60 corridor study intersections has not been assumed. However, based on the initial model results, analysis has been performed for the Revere Beach Parkway corridor study intersections to demonstrate their ability to accommodate the addition of traffic from the Route 60 corridor.

Results of this analysis are presented in Tables 5-46 and 5-47. The Proponent intends to pursue discussion of these improvements with MassDOT and DCR so that a full analysis can be performed in coordination with MassDOT and the CTPS using refined Regional Transportation Model results. It should be noted that, although the analysis of critical locations in isolation suggests some negative impacts with the HCA improvements, it does not reflect the positive impacts to be realized by the improvements. Rather, as previously noted, the analysis is presented to demonstrate that the critical intersections that will process the diverted regional traffic will perform adequately.

The traffic volume diversions for initial analysis purposes at the critical Revere Beach Parkway intersections are shown in Figures 5-29 and 5-30 for the Friday evening and Saturday afternoon peak hours, respectively. Review of these initial data and analysis will be continued in coordination with MassDOT and CTPS.

5.8 Alternative Modes of Transportation

While auto travel is a dominant mode of travel for the proposed Project, the Proponent is committed to improvements and strategies to encourage and maximize multi-modal access for the Project and take advantage of the unique adjacency of a rapid transit line.

5.8.1 Transit

As discussed in Section 5.2.1, the Project site is well served by public transportation, with several available options including the Blue Line rapid-transit Suffolk Downs Station abutting the site and bus routes within one-quarter mile of the site, all provided by the MBTA. To further encourage use of public transit, the Proponent intends to collaborate

with the MBTA on ways Suffolk Downs Station can be upgraded and improved. In addition, stronger pedestrian, bicycle, and shuttle bus connections will be made on-site to promote use of the station.

As described in detail in Section 5.9, the TDM Plan for the Project will include a range of incentives to encourage public transit as an access mode, particularly for employees.

5.8.1.1 MBTA Blue Line Ridership Build Analysis

Because it is a longer walk from the Resort, and in light of the fact that the MBTA does not support the idea of running shuttle service from the Resort to Beachmont Station, use of Beachmont Station by Resort patrons and employees is not expected to be significant. Further, the vast majority of trips on the Blue Line will be from the eastbound (i.e., outbound) direction, and will therefore reach Suffolk Downs Station first, where shuttle service to the Resort entrances will be available.

Accordingly, all Blue Line Project trips are assigned to Suffolk Downs Station for purposes of analysis. Analysis of the patron catchment served by the Blue Line between Suffolk Downs Station and Wonderland Station indicates that only about 5% of patrons are expected to arrive from that direction. Therefore, 95% of patron Blue Line trips are assigned to arrive from and depart toward the downtown Boston direction.

Tables 5-48 and 5-49 and Figure 5-31 present the projected Build boardings and alightings for Suffolk Downs Station. While a significant increase in use of Suffolk Downs Station is projected, the level of use is well within the physical capacity of the station. It is also worth noting that, while Resort patrons and employees are expected to board and alight at other Blue Line stations, analysis of the patron and employee catchments indicates that the number of Project trips using other Blue Line stations within East Boston and Revere will be relatively limited in absolute numbers.

5.8.1.2 MBTA Blue Line Capacity Analysis – Build Conditions

Based on the MBTA's FY 2014 budget, the MBTA projects an annual ridership growth rate of 1% per year. As such, it was assumed that ridership would grow 10% over the 10-year period between the available 2012 passenger count data and the year 2022 Build condition analysis with the Project.

To analyze the Blue Line capacity for the Build condition, the highest existing ridership volumes between Aquarium and Maverick Stations were studied consistent with the Existing conditions analysis in Section 5.2.1.2. This Build condition analysis also includes the MBTA's projected ridership growth and projected 2022 ridership for Project patrons and employees. Since Fridays and Saturdays are anticipated to be the busiest in terms of ridership for the Resort, the analysis considers weekday and Saturday inbound and outbound ridership, again consistent with the Existing conditions analysis in Section 5.2.1.2.

The capacity analyzed is not the absolute maximum capacity; rather, it is a conservative interpretation based on the MBTA's Service Delivery Policy. The absolute maximum capacity of riders (also referred to by the MBTA as "crush capacity") for each Blue Line Number 5 car is 145 people.

Projected 2022 Build hourly ridership by direction between Maverick Station and Aquarium Station is presented for a weekday and Saturday in Figure 5-32. The charts also include line capacity as it varies during the course of the day.

As shown in Figure 5-32, under the projected 2022 No-Build and Build conditions, inbound Blue Line ridership almost meets or exceeds available capacity between the hours of 8:00 AM and 11:00 AM. The impact of additional riders for the Resort is expected to be very limited over and above the projected MBTA 2022 ridership growth during these morning periods. While capacity is met or exceeded during these times, they are well within the maximum crush capacity of 145 riders per car as outlined in the Blue Book.[7] To mitigate the existing ridership between 9:00 AM and 10:00 AM, the MBTA could choose to operate additional trains to reduce the nine-minute headways.

The projected 2022 Blue Line ridership for the weekday eastbound (outbound) direction would exceed capacity several times a day, due to projected MBTA ridership growth or Project trips. In the 3:00 PM to 4:00 PM and 10:00 PM to midnight hours, the capacity would be exceeded simply due to the projected MBTA 2022 ridership growth regardless of any increased volume due to the Resort. On other occasions where ridership is projected to meet or slightly exceed capacity (i.e., between 7:00 PM and 10:00 PM), it is largely due

[7] *MBTA Subway Operations Fleet Roster* as of February 2010, 2010 MBTA Blue Book Chapter 2, Page 7.

to increase in Project ridership. This is expected to result in some crowding during these periods on a Friday night, but impacts are relatively limited as the Project ridership will be much lower on other weekdays. Projected MBTA ridership growth could be mitigated by operating additional trains to reduce headways or changing the MBTA Service Delivery Policy vehicle load standards.

The projected 2022 Build Saturday inbound and outbound ridership is well within available capacity with Project trips. With the projected additional Project, the line volume never approaches the peak load capacity based on the current service plan.

5.8.1.3 MBTA Bus Ridership, Build conditions

Since MBTA Bus Routes 119 and Route 120 primarily serve the local neighborhoods, ridership increases due to the proposed Project on either route are anticipated to be very small on an hourly basis. Based on analysis of the patron and employee catchment areas, it is anticipated that a relatively low number of riders will choose to ride either route to access the proposed Project, and such trips per bus will be minimal. Projected new Project trips on each route during the Friday evening and Saturday afternoon peak hours are presented in Table 5-50. Most of the projected new trips comprise employees coming to and from the site, and insignificant impact to bus capacity is expected.

Table 5-50 Project Generated Bus Ridership

	Friday Evening Peak Hour	*Saturday Afternoon Peak Hour*
Route 119		
Inbound	4 trips	8 trips
Outbound	3 trips	4 trips
Route 120		
Inbound	0 trips	0 trips
Outbound	1 trip	1 trip

Table 5-51 shows the estimated changes in MBTA bus travel time from the Existing to No-Build Conditions and from the No-Build to Build Conditions for the Friday evening and Saturday afternoon peak hours, respectively. Changes in travel time are based on the HCM approach delay in the No-Build and Build Conditions as presented on Section 5.7, Traffic Operations Analysis. Bus travel time will only be minimally effected by the additional Resort traffic due to local routing of both of these routes. Therefore, bus operations and schedules are not expected to be significantly impacted by the Project.

Table 5-51 Bus Travel Time Delay

	Friday Evening Peak Hour		*Saturday Afternoon Peak Hour*	
	Existing to No-Build	*No-Build to Build*	*Existing to No-Build*	*No-Build to Build*
Route 119				
Inbound	12 seconds	10 seconds	5 seconds	3 seconds
Outbound	41 seconds	48 seconds	7 seconds	-1 second
Route 120				
Inbound	16 seconds	No Change	3 seconds	No Change
Outbound	388 seconds	50 seconds	385 seconds	32 seconds

5.8.2 Pedestrian Access

Due to the close proximity of residential areas to the Project site, walking is, and will continue to be, attractive to some employees and patrons. For this reason, the Project site layout has been designed to encourage pedestrian activity to and from the site by making appropriate connections to the existing off-site pedestrian network in the area.

The Project recognizes the existing connection between the Orient Heights neighborhood and retail stores located north of the Project site. Currently, residents of Orient Heights access these stores through the Suffolk Downs site. The Project site plan will enhance and strengthen the safety and quality of this pedestrian link.

On-site pedestrian circulation is described in detail in Sections 1.1.1.5 and 4.0. Pedestrian accommodations and safety will be afforded priority in the design development of off-site infrastructure.

Many of the off-site improvements to be provided under the HCAs include improvements in pedestrian accommodations and safety. Key improvements include the following:

- Provision of a crosswalk on Winthrop Avenue east of Tomasello Drive;
- Protected signal accommodations for pedestrians at the intersection of Route 16 with Route 145 (Winthrop Avenue) and Harris Street;
- Streetscape and safety improvements in and around Donnelly Square;
- Streetscape and pedestrian improvements on Winthrop Avenue between Beachmont Station and Tomasello Drive;
- Enhanced and more direct pedestrian connection between Suffolk Downs Station and the Project site;

- Improved pedestrian accommodations at Bell Circle and Brown Circle; and
- Introduction of concurrent pedestrian phasing at signalized intersections where feasible.

5.8.3 Bicycle Access

The Project seeks to continue the ongoing north-eastward expansion of the bicycle network from the East Boston piers. This expansion provides an excellent opportunity for the Project to significantly add to the bicycle infrastructure of the area, which will not only benefit Project patrons and employees but also the communities of East Boston, Revere, and other nearby municipalities.

The Proponent proposes to provide on-street bicycle accommodations along the Bennington Street corridor extending between Saratoga Street to the south and Revere Beach Boulevard to the north. With the current on-street bicycle accommodations on Bennington Street south of Saratoga Street, the proposed extension will provide the communities of East Boston and Revere with a "beach-to-beach" connection between Constitution Beach to the south and Revere Beach to the north. In addition to these proposed accommodations on Bennington Street, the Proponent proposes to provide bicycle connections that extend into the Project site at Suffolk Downs Station and along Winthrop Avenue to Tomasello Drive. Figure 5-5 in Section 5.2.3 present the proposed bicycle accommodations connecting to the Project site in the context of existing and planned bicycle facilities.

5.8.3.1 Bennington Street Corridor connection to Revere Beach

The Project's proposed expansion of the existing bicycle network will extend bicycle accommodations from Saratoga Street along Bennington Street to Eliot Circle at Revere Beach. This connection will provide the area with an almost continuous connection between the East Boston waterfront, Constitution Beach, and the front entrance to DCR's Belle Isle Marsh and Revere Beach, connecting several residential neighborhoods with retail, recreation, and transportation opportunities. It is anticipated that the changes to the corridor will be within the existing curb-to-curb width, thus minimizing the impact to adjacent communities. A bicycle route connecting several recreational opportunities may bring additional visitors to the area and has the potential to increase neighborhood livability and economic activity without significantly increasing automobile traffic and impacts.

The Proponent also plans to provide a spur connection from the Bennington Street corridor to the site to supply Project employees and patrons with bicycle access to the site. It is expected that many Project employees will live within adjacent neighborhoods, and providing bicycle access from Bennington Street will encourage them to bicycle to work.

In addition, bicycle access from Bennington Street and accommodations internal to the site will provide bicycle access to the retail store north of the Project site for residents living near and adjacent to the Bennington Street corridor.

5.8.3.2 Site Accommodations

As described in Section 4.0, bicycle paths and connections are integrated into Project site design. These paths will connect the Project's main bicycle access points from the wider area bicycle network with desired destinations within the Project site. Secure bicycle parking will be provided at the employee entrances and at locations convenient for patrons. The number of bicycle parking spaces required was determined in accordance with the BTD "Bicycle Parking Guidelines" (the Guidelines). Clearly, the Guidelines do not include requirements for a gaming resort land use, and BTD asked that the Guidelines be applied by considering the Project as a campus.

The BTD guidelines for a campus call for one secure/covered parking space per staff for 15% of the planned part- and full-time campus-wide occupancy. Based on the highest projected number of Project employees on-site at any given time (i.e., approximately 1,200 employees), this yields a requirement for 60 bicycle parking spaces. In addition, BTD guidelines for a campus call for one outdoor/covered or outdoor/open parking space for patrons and visitors for 5% of estimated daily building users. Based on the highest projected patron occupancy on-site at any given time (i.e., approximately 2,000 patrons), this yields a requirement for 100 bicycle parking spaces. Accordingly, the Project will provide a total of 160 covered bicycle parking spaces, along with some additional visitor "short-term" bicycle parking spaces close to the building entrance. At the entrance to Casino Area II, valet bicycle service will be available in addition to a bicycle rack. The Proponent has also committed to funding two bike-share Hubway stations on the Project site, one near the resort and one near Suffolk Downs Station, when the City expands the program to East Boston.

5.8.4 High Occupancy Vehicle Shuttle Plan

An effective way to accomplish the objectives of the TDM plan (described in Section 5.9) to reduce travel by private autos, particularly SOV trips, is the use of HOVs. While HOV trips will be encouraged for patron and employee travel, and many patrons will visit the Project in private buses or coaches, the Proponent will substantially expand the use of alternative modes of transportation through implementation of an off-site HOV Shuttle Plan operated by a suitably qualified contractor with extensive experience in the Boston region. These shuttle operations will be in addition to the on-site shuttle service connecting Suffolk Downs Station with the Resort building entrances.

The off-site shuttle plan will be tailored to the distinct needs of employees and patrons, and will accommodate employee commuting needs as described in Section 5.10.1. The shuttle plan for patrons will encompass a diverse range of services to provide alternative

transportation for patrons to and from multiple locations, including the East Boston business districts, nearby tourist, cultural, and entertainment venues, and area hotels. The purpose of the shuttle services goes beyond catering for the needs of patrons and minimizing vehicle trips; it is also intended to stimulate business and tourism in the region by enabling convenient transportation connections to the Resort for tourists, visitors, and business entities.

A major advantage of an off-site shuttle service is the flexibility with which it can be planned and operated. In essence, it is in the Proponent's interest to provide shuttle service wherever there is demand, and the routing and scheduling of shuttles can be tailored to satisfy such demand. Further, the shuttle plan implemented will be dynamic and responsive to demand changes as they occur.

Accordingly, it is not possible or necessary to identify specific service locations or routes at this stage of planning. The plan will be framed around an extensive variety of expected areas of demand, which can be continuously modified and optimized with experience over time and in coordination with state, municipal, business, and non-profit entities. The Proponent will also partner with Boston-area hotels, restaurants, entertainment venues, and tourism organizations to emphasize linkages with existing local attractions and services. It is anticipated, however, that HOV shuttle service will be provided to at least the following locations:

- MBTA transit hubs such as South Station and North Station;
- Logan Airport;
- Downtown hotels;
- Planned water transportation ferry/taxi dock on the East Boston waterfront;
- East Boston business districts;
- BCEC and Hynes Convention Center;
- Citi Performing Arts Center in Boston's Theater District; and
- Massport Black Falcon Cruise Terminal.

5.9 Transportation Demand Management

The Proponent is committed to implementing a robust TDM program, the primary objective of which is to reduce SOV travel, thereby reducing parking demand, congestion, and associated environmental impacts from the Resort. Complementary to the reduction in vehicular impacts, the TDM plan also enhances mobility by alternative modes of travel by

promoting walking, bicycling, ridesharing, and transit. The TDM Plan is an integral component of the overall Project mitigation package, and it overlaps with other key plan elements such as parking demand management and infrastructure improvements.

While goals for TDM programs targeted at employees and patrons are the same (e.g., to reduce drive-alone travel, reduce travel during commuter peak hours, and reduce reliance on personal automobile), the actual execution and implementation of these programs varies because of differences in travel behavior and characteristics of employees and patrons. As such, TDM programs need to be tailored to each group and account for unique needs. The Proponent proposes to develop and implement TDM actions and strategies appropriate for each user group.

The Proponent will prepare the TDM plan in close coordination with other stakeholders such as Massport, MBTA, and the City of Boston, and will commit to the plan by executing a TAPA with BTD. The plan will be comprehensive and include policy/management, infrastructure, and programmatic components. The remainder of this section discusses the proposed TDM plan in more detail.

5.9.1 Regulatory Context

Existing state and local regulations create TDM requirements that influence the way in which the Project can proceed. The Proponent intends to comply with both the letter and the spirit of these regulations.

State Regulation 310 CMR 7.16 (i.e., the Rideshare Regulation), is part of the Massachusetts SIP and requires employers of more than 250 employees to establish an SOV reduction target goal and implement a variety of TDM measures for employees to reach that goal.

In addition, the City of Boston will require the Proponent to execute a TAPA, which will establish a variety of TDM programs to be implemented by the Proponent and monitored by the BTD. It is the Proponent's expectation that a coordinated set of TDM measures will be developed for the Project regardless of jurisdiction.

In combination, the regulatory framework creates an environment in which TDM can be successful by aggressively managing parking, requiring employers to implement TDM programs, and working with developers to mitigate transportation impacts through the TAPA agreements. They also provide means for the city and state to monitor TDM measures identified in the plan.

5.9.2 Developmental Framework

To ensure a balanced and multi-modal transportation network that reduces auto dependency, the Proponent has defined a framework for implementing programs to reduce SOV trips. Under this framework, the Proponent has primary responsibility for developing and updating the TDM plan. The Proponent will ensure implementation of, and long-term compliance with, the plan through four independent but overlapping strategies:

1. Designating a Transportation Coordinator

   The Proponent bears responsibility for ensuring implementation of Plan by subsidiaries, tenants, and operators of individual components of the Project (e.g., multi-purpose meeting/entertainment space, hotels, retail, and restaurants). To the extent that ownership/management of individual components changes over time, requirements of the TDM plan will be formally "carried forward" to new management by incorporating specific requirements into binding legal agreements.

   Oversight of Plan implementation will be assigned to a Transportation Coordinator, whose duties will include, but not be limited, to the following:

   - Developing and implementing TDM measures identified in the Plan;
   - Acting as Project liaison to the TMA and MassRIDES, the statewide travel options program;
   - Coordinating with the various tenants and management companies within the development regarding the Plan;
   - Monitoring implemented programs for compliance with the TAPA and working with the City of Boston to update the Plan as necessary;
   - Maintaining and disseminating information on transit service, transit passes, ridesharing, and other alternative modes;
   - Advocating with transportation agencies at local and state levels to improve transportation infrastructure and services;
   - Developing marketing materials and hosting transportation-related events to promote the use of commuting alternatives; and
   - Answering questions from employees and visitors, and assisting them with their commuting/travel decisions.

2. Joining the Logan Transportation Management Association (Logan TMA)

   Implementation of the Plan will be facilitated by collaboration with the Logan TMA. The Proponent will join the TMA and encourage tenants to join as well. Through the TMA, all users on-site will have access to commuter services.

3. Forming Strategic Partnerships

   The Proponent will explore opportunities and play a leadership role in developing partnerships with other strategic stakeholders in the immediate area and region including, but not limited to, Massport, the Cities of Boston of Revere, A Better City, private transportation operators, the Massachusetts Convention Center Authority, and various tourism organizations.

4. Binding TAPA Commitments

   Elements of the Plan will be incorporated into the City of Boston's TAPA, enabling the City to be directly involved in implementation, monitoring, and enforcement of the TAPA under Article 80 of Boston zoning. The TAPA will establish a mechanism for updating the TDM Plan over time as conditions change and new technologies and approaches become available.

5.9.3 TDM Measures – By Land Use

TDM measures are most often directed at commuter travel, and are therefore implemented at the work-site. However, due to the nature of the Project and the desire to create an inviting environment and travel convenience with a choice of transportation options for all user groups, the Plan includes trip reduction measures for gaming, retail, and hotel patrons as well as employees. Some operational characteristics of the Project, such as 24-hour operations, lend themselves to spreading site-generated traffic over the course of the day, reducing the potential for vehicular trips during peak commuter hours.

The Proponent will work with individual Project tenants to join the TMA and implement TDM strategies for their employees that are equivalent to the TDM for the Proponent's own employees. Because not every TDM program may be suitable for all Project tenants that have employees, the Transportation Coordinator will offer technical assistance to develop and implement individual Tenant TDM programs.

5.9.4 Supporting Site Design and Program Elements

The Project site design itself is a critical supporting component of the TDM plan. As described in detail in other sections, the site layout, circulation, and accommodations are designed to foster a multi-modal Project. The physical layout of the Resort will provide wide sidewalks, interior walkways, and well-connected gaming and retail spaces, which will promote a pleasant walking environment attractive to visitors. Key site design and programmatic elements include the following:

- Pedestrian-scale streetscape design will include paving, street tree planting, signage, street furniture, and pedestrian-oriented street lighting;

- Sidewalks and walkways on the site will form a continuous network and make key internal and external pedestrian connections to the public realm both internal and external to the site;

- A bicycle-friendly environment, supported by necessary bicycle accommodations on the site, and coupled with conveniently located indoor and outdoor bicycle parking, is integrated throughout the site design to foster connections to public off-site bicycle accommodations;

- The Proponent will actively seek to attract a variety of retail tenants to the development which will provide services/products that meet the needs of visitors and employees;

- On-site amenities will provide services that reduce the need for employees to have their own vehicle available to run errands such as dining services, ATM, convenience retail and emergency nurse/medical facilities;

- The site design includes convenient curbside locations accommodating of HOV vehicles and shuttles for drop off and pick up of rideshare patrons and employees; and

- An extensive and comprehensive HOV shuttle plan, as described in Section 5.8.4, will support the entire Project program.

5.9.5 Summary of TDM Elements

This section provides a summary of proposed TDM plan measures, policies, and strategies to support the Project. These commitments will be formalized in a TAPA to be executed with the BTD.

TMA Membership

1. Outreach to area businesses or TMA, including, but not limited to, the following:

    - Massport;

    - Massachusetts Convention Center Authority;

    - A Better City;

    - Greater Boston Chamber of Commerce; and

    - Revere Chamber of Commerce.

2. Become a member of the Logan TMA.

3. Require Resort tenants to join a TMA.

Transportation Coordinator

1. Designate an on-site Transportation Coordinator to be responsible for all transportation programs and primary contact with BTD, Revere, MassDOT, MBTA, and Massport.

2. Designate a deliveries/loading dock manager.

3. Schedule deliveries outside of peak traffic and night-time periods.

4. Designate a parking manager.

Transit Pass Programs and Promotion of Transit

1. Subsidize MBTA Transit passes (Charlie Cards) for all full- and part-time employees.

2. Offer on-site transit pass sales.

3. Participate in MBTA Corporate T-pass Program (employees/employer receive a pre-tax deduction) sales.

4. Provide transit incentives to patrons.

5. Provide enhanced shuttle service between Suffolk Downs Station and the patron and employee entrances at Resort buildings.

6. Provide enhanced pedestrian connections to Suffolk Downs Station and local bus stops.

7. Provide MBTA bus stop on site if MBTA wishes to modify bus routes through site.

8. Provide shuttle service to planned water transportation at Pier 1 in East Boston.

Ridesharing/Carpooling, Auto-Trip Reduction and Parking Management

1. Facilitate rideshare matching for employees through staff data base/software.

2. Participate in MassRIDES (Massachusetts Car Sharing Program) through TMA.

3. Designate preferential parking for carpool/vanpools.

4. Designate preferential patron parking for fuel efficient/alternative fuel vehicles.

5. Provide electric car charging stations in parking areas.

6. Enforce five-minute vehicle idling in conformance with State law.

7. Restrict employee parking on-site to senior management and critical staff only.

8. Provide employee parking remote from Resort site supported by 24-hour shuttle service.

9. Work with BTD and City of Revere to develop and implement effective on-street parking plans to protect neighborhoods from Resort-related parking.

10. Implement local hiring to the extent possible and allowable under law to reduce auto commuting.

11. Provide on-site facilities including ATM, dining and convenience services.

12. Provide on-site medical/nurse facilities.

13. Provide direct-deposit pay for employees.

14. Provide incentives for non-auto commuters.

15. Work with visitor and tourist entities to provide coach and/or shuttle connecting resort with the following:

    - MBTA transit hubs such as South Station, North Station, Lynn commuter rail station, and Wonderland Station parking garage;
    - Logan Airport;
    - Downtown, Back Bay, Theater District, and Seaport (Innovation District) hotels;
    - Planned water transportation ferry/taxi dock on the East Boston waterfront;
    - East Boston business districts;
    - BCEC and Hynes Convention Center;
    - Massport Black Falcon Cruise Terminal; and
    - Boston region major tourist locations.

16. Provide parking spaces for a car-sharing entity (such as Zipcar), subject to demand.

17. Work with MassDOT to implement directional signage program to direct drivers to regional rather than local roadways.

18. If feasible, work with GPS network providers to direct drivers to regional rather than local roadways.

Guaranteed Ride Home Program

1. Offer a "Guaranteed Ride Home" to all employees in the event of an emergency.

Information Disseminations and Promotion of Travel Alternatives

1. Provide employees and patrons with MBTA system maps.
2. Provide information on travel alternatives for employees and patrons via the internet/Resort web-site.
3. Provide information on travel alternatives to new employees.
4. Incorporate information on travel alternatives in all marketing materials and instructions to vendors, special event organizers, etc.
5. Provide "transportation kiosks" to display transit service and schedules in prominent locations in Resort and employee areas.
6. Promote bicycles as an alternative to SOV travel by providing materials to employees on bicycle commuting and bicycle safety.
7. Provide quarterly employee transportation newsletter or bulletin summarizing transit, ridesharing, bicycling, alternative work schedules, and other programs.
8. Sponsor an annual "Transportation Day" at which employees may obtain info on travel alternatives and register for ridesharing.
9. Modify work shifts for employees to minimize commuting during peak traffic periods and/or offer alternative work schedules.
10. Modify shifts to the extent possible to avoid nighttime periods when the MBTA is not operating and transit is not a feasible commuting mode.
11. Provide flex time and telecommuting options when feasible.
12. Provide sheltered, secure bicycle parking for employees and patrons.
13. Provide convenient short-term outside bicycle parking for visitors. At the entrance to Casino Area II, valet bicycle service will be available in addition to a bicycle rack.
14. Provide locker rooms, showers, and changing facilities for employees commuting by bicycle.
15. Provide two Hubway stations on-site when the City expands the program to East Boston.

16. Provide enhanced bicycle access to and within Resort site.

17. Negotiate employee discounts for purchase of bicycle equipment at local retailers.

Transportation Monitoring and Annual Report

1. Monitor employee and patron travel by mode.

2. Provide Annual Reports to BTD on transportation and TDM performance measures.

3. Execute annual ridesharing surveys for submission to MassDEP.

4. Discuss with MassDOT and implement monitoring of assumptions and effectiveness of TDM strategies.

5.10 Parking

5.10.1 Project Parking Supply

Today, large sections of the Suffolk Downs site are dominated by impervious parking areas, providing a current total of approximately 6,000 parking spaces, of which approximately 209 are located in the Barn Area/Horsemen's Lot. This parking supply far exceeds the demand associated with the proposed Project, and the total number of parking spaces will be reduced to a supply of approximately 4,891 spaces, excluding the Barn Area/Horsemen's Lot. The layout and location of on-site parking and on-site circulation is discussed in Sections 1.0 and 4.4. Allocation of parking spaces is summarized in Table 5-52.

Table 5-52 Project parking

Area	*Spaces*
Parking garage	2,550
North Lot	1,468
South Lot	413
Valet	460
Barn Area/Horsemen's Lot	209
Total	*5,100*

For the purposes of analysis, the 209 parking spaces in the Barn Area are not included in the total supply as they are not anticipated to always be available to patrons on a day-to-day basis. The net Project parking supply for analysis purposes is therefore 4,891 spaces.

While there is a total supply of almost 4,900 parking spaces, when designing to accommodate operational needs it is necessary to determine a practical operational capacity that reflects the fact that there will be a portion of cars circulating at any given time, and that a reasonable LOS must be achieved for patrons to find a space reasonably easily without undue circulation. Accordingly, the operational capacity is considered to be 85% of the total supply, equivalent to approximately 4,157 spaces.

5.10.2 Project Patron Parking Demand

To estimate parking demand associated with the Resort, hourly patron arrivals were forecast based on empirical data from other Caesars resorts and by applying an average stay of three hours per patron. Using the auto trip generation presented in Section 5.4 and vehicular arrival patterns presented in Table 5-14, a parking accumulation analysis was performed.

In addition to the new trips associated with the Resort, the existing racing activity at Suffolk Downs will continue. A conservative 50 vehicles was assumed on a typical Friday, while races are simulcast at the racetrack. For the Saturday parking analysis, counts were performed on a live race day in June 2013 to determine parking occupancy on-site associated with the racetrack.

Resort patron and racetrack demand were combined to derive hour-by-hour total parking accumulation for a Friday and Saturday. Results of the parking demand analysis for the Project peak days (i.e., Friday and Saturday) are presented in Figure 5-33.

As shown in Figure 5-33, the maximum parking demand on a typical Friday and Saturday is estimated at approximately 3,850 vehicles. The peak parking demand on Friday is estimated to occur at 9:00 PM, while the Saturday peak is expected to occur around 4:00 PM with the live racing activity overlapping with Resort patron activity. This peak parking demand represents a 79% utilization of the proposed patron parking supply on a typical Friday and Saturday.

Accordingly, the parking supply proposed for the Project is expected to more than adequately accommodate Project demand, and will provide a high LOS for users on a typical day-to-day basis. There will be adequate capacity, however, to accommodate variation in demand that may be associated with special events, holidays, or seasonal variations.

5.10.3 Employee Parking

Consistent with objectives of the TDM plan described in Section 5.9 to discourage employees from commuting in private cars and to encourage use of alternative modes such as transit, no employee parking will be provided on the Project site, with the exception of a limited number of spaces for senior management, essential staff, and disabled employees.

The parking plan for staff is based on the use of multiple geographically-dispersed parking locations remote from the Project site, with employee shuttle service to and from the Resort. This will result in maximum dispersion of employee auto trips, and will minimize employee VMT as employees will choose to park at locations that are most convenient for their commute. Further, it will minimize employee vehicle trips in the vicinity of the Project site, as the majority of employee trips will be intercepted on the roadway network before they reach the Project site area, and therefore will not use the roadway network local to the Project site.

While the Proponent's policy of limiting employee parking at the Project site (in favor of a ground shuttle program) may have the effect of encouraging more employees to choose transit for commuting, it is not expected that the numbers of additional employees will be sufficient to change the assumptions presented in the analysis.

It should be noted, however, that to present a conservative (i.e., worse case) Build traffic impact analysis, it was assumed that employees would park on-site. Therefore, the employee auto trips are included in the Build condition traffic assignment to the local roadway network, even though in reality they will not be added to the local network.

The Proponent proposes to engage a contractor to manage and operate the employee shuttle system, which will run continuously 24-hours per day, seven days a week, to serve the continuous turnover of multiple employee shift changes throughout the day. As discussed in Section 5.4, this will also provide a way for employees whose shifts start or end during the period when the MBTA is not operating (roughly 12:30 AM to 5:30 AM) to commute to work.

The shuttle contractor will be responsible for identifying available parking locations and developing the shuttle plan, but it is anticipated that locations could include strategic regional parking facilities such as the Logan Express park-and-ride lots or other existing public commuter parking facilities, or available private parking facilities. Also, as discussed previously, the Proponent and employee shuttle contractor will work with MassDOT, MassRIDES, MBTA, and Massport to collaborate on optimizing the use of existing parking facilities throughout the Boston area and region.

Section 6.0

Environmental Protection Component

6.0 ENVIRONMENTAL PROTECTION COMPONENT

Article 80 of the Boston Zoning Code specifies that the BRA may require that the applicant conduct studies to determine the direct or indirect impact to the environment reasonably attributable to a project. In accordance with the Secretary's Certificate on the ENF and the City of Boston comment letters, this section addresses various environmental considerations of particular interest to the City of Boston and the BRA in reviewing the impacts of the Project. Where the potential for direct or indirect impacts exists, design measures are incorporated to mitigate the impacts, to the extent economically feasible.

6.1 Wind

A pedestrian wind study was conducted to assess the proposed Project's effects on local conditions in pedestrian areas around the site and provide recommendations for minimizing adverse effects. The study involved wind simulations on a 1:400 scale model of the proposed Project and surroundings. Simulations were conducted in Rowan Williams Davies & Irwin Inc.'s (RWDI's) boundary-layer wind tunnel facility in Guelph, Ontario, for the purpose of quantifying local wind speed conditions and comparing them to appropriate criteria for gauging wind comfort in pedestrian areas. The criteria recommended by the BRA were used in this study (see Section 6.1.3).

6.1.1 Overview

Major buildings, especially those that protrude above their surroundings, often cause increased local wind speeds at the pedestrian level. Typically, wind speeds increase with elevation above the ground surface, and taller buildings can intercept those faster winds and deflect them down to the pedestrian level. The funneling of wind through gaps between buildings and the acceleration of wind around building corners may also increase wind speeds. Conversely, if a building is surrounded by others of equivalent height, it may be protected from prevailing upper-level winds, resulting in no significant changes to the local pedestrian-level wind environment. The most effective way to assess potential pedestrian-level wind impacts around a proposed building is to conduct scale-model tests in a wind tunnel.

The consideration of wind in planning outdoor activity areas is important since high winds tend to deter pedestrian use. For example, winds should be light or relatively light in areas where people will be sitting, such as outdoor cafes or playgrounds. For bus stops and other locations where people will be standing, somewhat higher winds can be tolerated. For frequently used sidewalks, where people are primarily walking, stronger winds are acceptable. For infrequently used areas, wind comfort criteria can be relaxed even further. The actual effects of wind can range from pedestrian inconvenience (e.g., the blowing of dust and other loose material in a moderate breeze) to severe difficulty with walking.

6.1.2 Methodology

Information concerning the Project site and surrounding area was derived from site photographs, specifications on surrounding buildings and terrain, site plans, and elevations of the proposed Project provided by the design team. The following configurations were simulated:

- No Build Configuration: includes all existing surrounding buildings; and
- Build Configuration: includes the proposed Project and all existing surroundings.

The wind tunnel model included the proposed development and all relevant surrounding buildings and topography within a 1,600-foot radius of the Project site. The mean speed profile and turbulence of the natural wind approaching the modeled area were also simulated in RWDI's boundary layer wind tunnel. The scale model was equipped with 82 specially designed wind speed sensors connected to the wind tunnel's data acquisition system to record the mean and fluctuating components of wind speed at a full-scale height of five feet above grade in pedestrian areas throughout the study area. Wind speeds were measured for 36 wind directions in 10-degree increments, starting from true north. Measurements at each sensor location were recorded in ratios of local mean and gust speeds to the reference wind speed in the free stream above the model. Results were then combined with long-term meteorological data recorded from 1982 to 2011 at Boston's Logan International Airport to predict full-scale wind conditions. The analysis was performed separately for each of the four seasons and for an entire calendar year.

The pedestrian wind study report provided as Attachment K contains "wind roses" summarizing the annual and seasonal wind climates in the Boston area based on the data from Logan International Airport. In general, prevailing winds in spring (i.e., March, April, and May) are from the west-northwest, northwest, west, southwest, and east. On an annual basis, the most common wind directions are those between southwest and northwest.

This study involved state-of-the-art measurement and analysis techniques to predict wind conditions in the study area. Nevertheless, some uncertainty remains in predicting wind comfort, and this must be kept in mind. For example, the sensation of comfort among individuals can be quite variable. Variations in age, individual health, clothing, and other human factors can change the response of a particular individual. Comfort limits used in this report represent an average for the total population. Also, unforeseen changes in the Project area, such as construction or demolition of buildings, can affect conditions experienced at the Project site. Finally, the prediction of wind speeds is necessarily a statistical procedure. Wind speeds reported are for the frequency of occurrence stated (one percent of the time). Higher wind speeds will occur but on a less frequent basis.

6.1.3 Pedestrian Wind Comfort Criteria

The BRA has adopted two standards for assessing the relative wind comfort of pedestrians. First, the BRA wind design guidance criterion states that an effective gust velocity (hourly mean wind speed +1.5 times the root-mean-square wind speed) of 31 mph should not be exceeded more than one percent of the time. The second set of criteria used by the BRA to determine the acceptability of specific locations is based on the work of Melbourne[1]. This set of criteria is used to determine the relative level of pedestrian wind comfort for activities such as sitting, standing, or walking. The criteria are expressed in terms of benchmarks for the one-hour mean wind speed exceeded 1% of the time (i.e., the 99-percentile mean wind speed) (see Table 6-1).

Table 6-1 BRA Mean Wind Criteria*

Dangerous	> 27 mph
Uncomfortable for Walking	> 19 and ≤ 27 mph
Comfortable for Walking	> 15 and ≤ 19
Comfortable for Standing	> 12 and ≤ 15 mph
Comfortable for Sitting	< 12 mph

* Applicable to the hourly mean wind speed exceeded one percent of the time.

The wind climate found in a typical downtown location in Boston is generally comfortable for pedestrian use of sidewalks and thoroughfares, and meets the BRA effective gust velocity criterion of 31 mph. However, without any mitigation measures, this wind climate is likely to be frequently uncomfortable for more passive activities such as sitting.

6.1.4 Test Results

Mean and effective gust wind speeds for each season as well as annually are provided in the full RWDI report (see Attachment K). Figures 6-1 and 6-2 graphically depict wind comfort conditions at each wind measurement location based on the annual winds for No Build and Build conditions, respectively. Typically, summer and fall winds tend to be more comfortable than the annual winds, while the winter and spring winds are less comfortable than the annual winds. The following summary of pedestrian wind comfort is based on the annual winds for each configuration tested.

The majority of the existing site was confirmed to have acceptable conditions with respect to pedestrian safety, with the exception of one area south of the existing grandstand. These existing unsafe wind conditions will be effectively mitigated and therefore improved with the addition of the proposed Project.

---

[1] Melbourne, W.H. 1978. *Criteria for Environmental Wind Conditions*. Journal or Industrial Aerodynamics. Vol 3. Pp 241-249.

6.1.4.1 No Build Configuration

Existing Grandstand Area (Sensors 21-24, 43-54 and 68-75)

A trend of increasing wind speeds west of the grandstand is evident in Figure 6-1. This trend is evidence of the sheltering effect of the existing structure. The area adjacent to the grandstand is appropriate for sitting (Sensors 24, 45, 47, 50 and 53). Further west from the grandstand, conditions are appropriate for standing (Sensors 44 and 51). Further back, towards the existing parking areas, conditions are appropriate for walking (Sensors 21-23, 43, 46, 48, 49, 52 and 54).

Along the racetrack, some shelter is provided by the grandstand to the west, creating conditions appropriate for walking (Sensors 71, 73, 75 and 76). However, the area north of the grandstand is less sheltered from prevailing easterly and westerly winds, creating conditions that are uncomfortable (Sensors 68 and 69).

Other Areas (Sensors 1 – 20, 25-42, 55-67, 76 and 77)

A wind comfort categorization of walking is considered appropriate for sidewalks. Sidewalks along Tomasello Drive and within the Orient Heights neighborhood southwest of the Project site are predominantly comfortable for walking. One segment of Tomasello Drive west of the existing grandstand currently experiences uncomfortable wind conditions due to exposure to prevailing westerly winds (Sensors 40, 57-59 and 63).

As shown in Figure 6-1, the proposed building site for Casino Area II and Hotel I was found to be mainly uncomfortable, with the eastern portion being comfortable only for walking (Sensors 1, 2, 4 and 6).

Elevated wind conditions, suitable for walking at best, are currently observed for much of the site north and south of the existing grandstand due to the exposed nature of the site (Sensors 13, 14, 16-20, 41, 42, 55, 56, 59-62 and 65-69).

6.1.4.2 Build Configuration

Casino Area II Entrance and Water Feature Area (Locations 1 through 11)

Shelter provided by the proposed Project is expected to significantly improve wind conditions over the Project site, with many of the previously uncomfortable wind conditions predicted to be comfortable for walking or better. The highly sheltered entrance to Casino Area II is predicted to be comfortable for sitting (Sensors 1-3, 5 and 6). Areas adjacent to the entrance are expected to be comfortable for standing (Sensors 4, 7 and 11), which is appropriate for the pedestrian traffic in these areas. The water feature proposed west of the casino will be located in an area where walking conditions are expected.

North and South Plazas (Locations 21 through 24, 43 through 54)

As shown in Figure 6-2, the North and South Plazas will be suitable for walking or better annually, with the majority of locations suitable for standing or sitting. The north and south extents of the plazas will have conditions appropriate for standing (Sensors 21, 22, 46 and 50-54). Increased sheltering in the central plaza areas will result in conditions appropriate for sitting, which will correspond well with the planned park benches and cafes in these areas (Sensors 43 and 47-49). Slightly increased wind conditions will occur in the narrow section between the North and South Plazas as a result of wind channeling between the adjacent structures. However, conditions appropriate for walking are anticipated, which will be appropriate for the pedestrian use of this area (Sensors 24, 44 and 45).

Other On-Site Areas (Locations 12 – 20, 34, 35, 41, 42, 55, 56, 59-62, 65-82)

The majority of other on-site areas near buildings, including secondary building entrances, will have conditions appropriate for the intended pedestrian usages. However, two areas are expected to remain uncomfortable for walking. These include the area south of the existing grandstand which currently exhibits unsafe wind conditions (Location 20), and on the proposed parking garage (Locations 80 and 81). While the area around Sensor 20 will remain uncomfortable, conditions are expected to be significantly improved from conditions currently experienced in this area. It should also be noted that this area currently does not pass the criteria used to assess pedestrian safety, and the proposed development will effectively mitigate these unsafe conditions. There is dense landscaping in the area, which should be retained or enhanced for wind reduction. Sensors 80 and 81 are on top of the proposed garage, and if frequent pedestrian use is anticipated, porous windscreens placed around the perimeter of the upper parking lot would reduce pedestrian discomfort at this location.

Off-Site Areas (Locations 25 through 33, 36-40, 57, 58, 63, 64)

Construction of the proposed Project is expected to reduce the speed of wind in most immediately surrounding areas. Further, it is not expected that the addition of the proposed development will have a significant negative effect in any of the surrounding areas. The most notable improvement is anticipated along Tomasello Drive just southeast of the shopping plaza (Sensors 57, 58 and 63). Other areas will remain in the same wind comfort category.

6.1.5 Conclusion

The pedestrian wind analysis demonstrates that shelter provided by the proposed Project is expected to significantly improve wind conditions over the site, with many previously uncomfortable wind conditions predicted to be comfortable for walking or better. Furthermore, the Project is not expected to have a significant negative effect in any of the surrounding areas. On the contrary, as described above, construction of the proposed

Project is expected to reduce wind speeds in most surrounding areas, most significantly along Tomasello Drive southeast of the existing shopping plaza. Anticipated wind conditions along pedestrian walkways, plazas, and open spaces will be comfortable for users. In addition, sheltering of the North Plaza will result in conditions appropriate for sitting, corresponding well with the planned outdoor restaurant seating areas.

6.2 Shadow

The Proponent conducted a shadow impact analysis to assess potential Project-related impacts. The analysis evaluated shadow conditions at four times of day (9:00 a.m., 12:00 noon, 3:00 p.m., and 6:00 p.m.) during the vernal equinox (March 21), summer solstice (June 21), and autumnal equinox (September 21), and at three times of day (9:00 a.m., 12:00 noon, 3:00 p.m., and 6:00 p.m.) during the winter solstice (December 21). Shadows were determined using the appropriate altitude and azimuth data for Boston.

The shadow impact analysis includes net new shadow as well as existing shadow. The incremental impact of new shadow cast by the proposed Project is shown in dark gray in Figures 6-3 through 6-17, while existing shadows are shown in light gray. The shadow analysis focuses on open spaces, residential areas, major pedestrian areas, and plazas in the Project vicinity.

The shadow analysis demonstrates that new shadow impacts from the Resort will be minimal, and will not affect any sensitive areas off-site. Likewise, the network of pathways throughout the entry landscape will be unaffected by new shadow, as will most of the open spaces on the Project site.

6.2.1 Vernal Equinox (March 21)

At 9:00 a.m. on the vernal equinox, new shadow from the Resort will extend in a westerly direction onto portions of Tomasello Drive and the Entry Court in front of Casino Area II and Hotel I (see Figure 6-3). Portions of the North Plaza and South Plaza will be covered in shade from existing shadow cast by the grandstand and clubhouse, although no new shadow will be cast onto these areas. No new shadow will fall on the grandstand or clubhouse. All new shadow will be contained on-site.

At 12:00 noon, the Resort will cast new shadow towards the north, covering a portion of the open space northwest of Casino Area II close to the building (see Figure 6-4). The southernmost portion of the North Plaza will also be in shadow. New shadow from the parking garage will cover part of the access from Tomasello Drive. No new shadow will fall on the grandstand or clubhouse. All new shadow will be contained on-site.

At 3:00 p.m., new shadow from the proposed Resort will extend northeast across southern and western sections of the North Plaza as well as the access from Tomasello Drive (see Figure 6-5). Shadow from Hotel I will fall on the roof of Casino Area II, but will have

minimal ground-level impacts. South Plaza will remain entirely unaffected by new shadow, as will the other open spaces and sidewalks on the Project site. A small area of new shadow will fall on the western roof of the grandstand. All new shadow will be contained on-site.

The sun sets at approximately 6:00 p.m. during the vernal equinox, and therefore existing shadows are abundant at this time (see Figure 6-6). Nonetheless, since the Project site is largely empty, development of the Project will generate new shadows at this time. New shadows will cover the North Plaza and most of the South Plaza, and will also extend across a portion of the eastern side of the racetrack infield. The southern half of the grandstand and northern half of the clubhouse will also be cast in new shadow. A narrow band of new shadow will extend outside of the eastern side of the Project site boundary towards Bennington Street.

6.2.2 Summer Solstice (June 21)

At 9:00 a.m. on the summer solstice, new shadow from the Resort will be minimal (see Figure 6-7). Small areas of new shadow will extend westward from Project buildings to cover the Port Cochere immediately in front of Casino Area II and Hotel I. A sliver of new shadow will fall along the northwest side of the new parking garage. No new shadow will fall on the grandstand or clubhouse. All new shadow will be contained on-site.

At 12:00 noon, new shadow will be minimal, limited to narrow sections of ground along the northern sides of Project buildings (see Figure 6-8). A small area at the southernmost end of the North Plaza will be in new shadow. No new shadow will fall on the grandstand or clubhouse. All new shadow will be contained on-site.

At 3:00 p.m., new shadows from the Resort will extend over the southern half of the North Plaza (see Figure 6-9). The access road from Tomasello Drive will also be in new shadow. A very small area of new shadow will fall on the western roof of the grandstand. All new shadow will be contained on-site.

At 6:00 p.m., shadows will extend eastward from the proposed Resort, falling across the North Plaza and South Plaza (see Figure 6-10). Other landscaped open spaces will remain unaffected at the time. A very small area of new shadow will fall on the southern portion of the grandstand roof. All new shadow will be contained on-site.

6.2.3 Autumnal Equinox (September 21)

At 9:00 a.m. on the autumnal equinox, shadows will extend toward the northwest, and new shadow from the Resort will extend over a portion of the Entry Court and sections of Tomasello Drive (see Figure 6-11). The North Plaza and South Plaza will be in sun except for a narrow band of each that will be covered in existing shadow from the grandstand and clubhouse. No new shadow will fall on the grandstand or clubhouse. All new shadow will be contained on-site.

At 12:00 noon, new shadow extending north from the Resort will fall on the southernmost portion of the North Plaza as well as a portion of the landscaped open space on the northwest side of Casino Area II (see Figure 6-12). No new shadow will fall on the grandstand or clubhouse. All new shadow will be contained on-site.

At 3:00 p.m., shadows will extend toward the northeast and the Resort will cast new shadow over southern and western portions of the North Plaza as well as the access road from Tomasello Drive (see Figure 6-13). The South Plaza and other open spaces will remain unaffected. A small portion of new shadow will fall on the western grandstand roof. All new shadow will be contained on-site.

The sun sets at just after 6:00 p.m. during the autumnal equinox, and therefore existing shadows are abundant at this time (see Figure 6-14). Nonetheless, the Resort will cast some new shadow across the easternmost portion of the North Plaza and the northernmost portion of the South Plaza. Most of the Project site will be in shadow at this time, with the exception of the Entry Court and front of Casino Area II and Hotel I as well as the northern portion of the racetrack infield. The clubhouse roof and western portion of the grandstand roof will be cast in new shadow. All new shadow will be contained on-site.

6.2.4 Winter Solstice (December 21)

At 9:00 a.m., the Resort will cast new shadow to the northwest across portions of Tomasello Drive and over a small area of the adjacent tank farm (see Figure 6-15). The northern portion of the Entry Court as well as the landscaped open space northwest of Casino Area II will also be covered in new shadow. The parking garage will cast new shadow across the western portion of the access road from Tomasello Drive. No new shadow will fall on the grandstand or clubhouse.

At 12:00 noon, new shadow extending north from the Resort will cover the southern portion of the North Plaza as well as the landscaped open space located on the northwest side of Casino Area II (see Figure 6-16). The parking garage will cast new shadow over Tomasello Drive as well as the access road along the north side of the garage. No new shadow will fall on the grandstand or clubhouse. All new shadow will be contained on-site.

At 3:00 p.m., the Resort will cast new shadow to the northeast over the North Plaza and portions of the surface parking (see Figure 6-17). A small portion of the landscaped open space located northwest of Casino Area II will also be covered in new shadow. The northern portion of the grandstand roof will be cast in new shadow. All new shadow will be contained on-site.

6.2.5 Conclusions

The shadow analysis demonstrates that new shadow impacts from the Resort will be minimal, and will not affect any sensitive areas off-site. Likewise, the network of pathways throughout the entry landscape will be unaffected by new shadow, as will most of the open spaces on the Project site. The North Plaza will have periodic impacts from new shadow, with these impacts predominantly during the late afternoon hours. During the summer this shadow will provide a welcome relief from the sun. During evening hours in warmer months, the South Plaza will also be in shadow. During fall and winter in particular, some new shadow will minimally affect the landscaped open space located northwest of Casino Area II. Roadways will be unaffected by new shadow except for some stretches of Tomasello Drive, which will be in shade during the early morning hours.

6.3 Daylight Analysis

The purpose of the daylight analysis is to estimate the extent to which a proposed project will affect the amount of daylight reaching streets and sidewalks in the immediate vicinity of a project site. The daylight analysis for the Project considers existing and proposed conditions.

Much of the 161-acre Project site is undeveloped under existing conditions, meaning that existing features on the Project site do not obstruct daylight. Under proposed conditions, Resort buildings will be situated such that large areas around the edges of the site will remain without buildings, thereby leaving buffers for adjacent communities and minimizing the Project's daylight obstruction impacts from many surrounding viewpoints.

6.3.1 Methodology

The daylight analysis was performed using the Boston Redevelopment Authority Daylight Analysis (BRADA) computer program[2]. This program measures the percentage of sky-dome that is obstructed by a project and is a useful tool in evaluating the net change in obstruction from existing to build conditions at a specific site.

Using BRADA, a silhouette view of the building is taken at ground level from the middle of adjacent city streets or pedestrian ways centered on the proposed building. The building façade facing the viewpoint, including heights, setbacks, corners and other features, is plotted onto a base map using lateral and elevation angles. The two-dimensional base map generated by BRADA represents a figure of the building in the "sky dome" from the viewpoint chosen. The BRADA program calculates the percentage of daylight that will be obstructed on a scale of 0 to 100 percent based on the width of the view, distance between

[2] Method developed by Harvey Bryan and Susan Stuebing, computer program developed by Ronald Fergle, Massachusetts Institute of Technology, Cambridge, MA, September 1984.

the viewpoint and building, and the massing and setbacks incorporated into the building design. The lower the number, the lower the percentage of daylight obstructed from any given viewpoint.

The analysis compares existing and proposed conditions. Under existing conditions, the site is largely undeveloped and contains large areas of paved surface parking as well as open space (related to the racetrack and infield). Under proposed conditions, development will still be pulled toward the middle of the Project site, leaving buffers around the site edges. Proposed uses will differ from the existing uses in surrounding areas, which include residential neighborhoods and a tank farm.

Four viewpoints were chosen to evaluate daylight obstruction for existing and proposed conditions:

- **Viewpoint 1**: from Tomasello Drive facing southeast toward the Project site;
- **Viewpoint 2**: from North Plaza facing northwest toward the proposed parking garage;
- **Viewpoint 3:** from the North Plaza facing southwest toward Casino Area II; and
- **Viewpoint 4:** from Waldemar Avenue on the southwest boundary of the Project site facing northeast toward the Project.

6.3.2 Daylight Analysis Results

Results for each viewpoint under existing and proposed conditions are described in Table 6-2. Figure 6-18 illustrates the BRADA results for each analysis; viewpoint locations are shown on Figure 6-19.

Table 6-2 Daylight analysis results for Existing and Proposed conditions.

Viewpoint	*Existing*	*Proposed*
1	0%	9.8%
2	0%	28.3%
3	0%	86.6%
4	0%	16.5%

Viewpoint 1

Tomasello Drive is a wide roadway that runs along the northwest edge of the Project site. Viewpoint 1 was taken from the center of the roadway looking southeast toward the proposed Casino Area II and the proposed parking garage. Since Tomasello Drive is relatively wide and most of the proposed buildings are set back from the property line,

daylight obstruction from this viewpoint under proposed conditions is very low (9.8%); since this portion of the site is currently undeveloped, daylight obstruction under existing conditions is 0%. The Resort's effect on daylight obstruction from this viewpoint will be minimal.

Viewpoint 2

The proposed North Plaza is situated between the proposed parking garage and Casino Area I (i.e., the existing grandstand building). Viewpoint 2 was taken from the center of the plaza looking northwest at the proposed parking garage. Since the Project site is currently undeveloped at this location, the daylight obstruction under existing conditions is 0%. Due to the relatively low height of the proposed parking garage, Project development will increase daylight obstruction from this viewpoint to just 28.3%, which is favorable for an open space.

Viewpoint 3

The proposed North Plaza is situated northeast of the proposed Casino Area II. Viewpoint 3 was taken from the center of the open space looking southwest at the proposed building. Since this portion of the Project site is currently undeveloped, the existing daylight obstruction value is 0%. Project development will increase daylight obstruction from this viewpoint to 86.6%. Although this daylight obstruction value is relatively high, surrounding viewpoints to the east, west, and north from this same location are expected to be low. Therefore, daylight obstruction throughout the open space is expected to be appropriate for its anticipated use.

Viewpoint 4

Viewpoint 4 was taken from Waldemar Avenue on the southwest boundary of the Project site looking northeast into the Project site. This viewpoint best represents the daylight obstruction impact for the residential neighborhood south of the Project. Residences further away from the Project site are at higher elevations, thus minimizing the Resort's impact on daylight. Since the Project site is undeveloped at this location, the existing daylight obstruction value is 0%. Project development will increase daylight obstruction to 16.5%, representing a minimal impact from this viewpoint.

6.3.3 Conclusions

Since the Project site is largely undeveloped and mostly consists of paved surface parking lots under existing conditions, results from the BRADA analysis indicate that Project development will increase daylight obstruction relative to existing conditions from all viewpoints. However, the Project site is separated from the surrounding community by roadways, open spaces, the racetrack, horse stalls, and surface parking lots, and the tallest elements of the Resort will be pulled toward the center of the site, reducing potential

daylight obstruction from surrounding neighborhoods. From certain vantage points within the Project site near the tallest portion of the Resort (i.e., Casino Area II and Hotel I), daylight obstruction will increase significantly. In most other areas, daylight obstruction will be greater under proposed conditions than under existing conditions, but that obstruction will not be extensive and will be entirely suitable for the proposed uses.

A minimal amount of daylight obstruction is anticipated from the residential area south of the Project site, which is the residential area closest to the Resort. Since residences further south are at higher elevations, daylight obstruction will be even less.

6.4 Solar Glare

A solar glare study is being conducted by RWDI to ensure that the Project, including the proposed PV array, will not have any significant solar glare impacts, particularly for operations at Logan International Airport and in the immediate vicinity of the Project site.

Two meetings with Massport and FAA staff have been held, with one meeting specifically conducted to discuss any potential glare impacts and the scope of the solar glare study to be conducted by RWDI. Based on a request from Massport, five additional locations at Logan International Airport (R15L, R33L, R33R, R4L, and R4R) were added to the four initial locations at the airport (R15R, R22R, R22L, and R27) for the analysis (see Figures 6-20 and 6-21) to assess any potential solar glare impacts. Airport locations will be studied using actual flight path data provided by Massport, which will greatly increase the accuracy with which the Project is able to assess potential impacts. The FEIR will include results of the solar glare study.

If any changes to the alignment of the PV array or other building elements are necessary, these changes will be described in the FEIR.

6.5 Air Quality

6.5.1 Introduction

An air quality analysis was conducted to determine the impact of pollutant emissions from combustion and mobile source emissions generated by the Resort. A microscale analysis was performed to evaluate the potential air quality impacts of carbon monoxide (CO) due to traffic flow in the Project area. A mesoscale analysis was performed to assess the net increase in ozone precursor pollutant emissions as a result of increased traffic. In addition, for stationary sources (i.e., combustion source stacks), the EPA-approved air dispersion model was used to estimate Project-generated ambient concentrations of nitrogen oxides (NOx), particulate matter (PM-10 and PM-2.5), and sulfur dioxide (SO_2) in addition to CO.

A transportation conformity analysis was not required as this Project requires no Federal funding, sponsorship, or approval by the Federal Transit Administration (FTA) or the Federal Highway Administration (FHWA).

Summary of analysis: Overall, the Project will produce no significant air quality deterioration. All predicted CO concentrations at modeled intersections are well below applicable national air quality standards. All stationary sources will be state of the art technology and will be permitted through MassDEP. Analysis of stationary sources also shows all modeled concentrations to be below applicable national air quality standards. Although increases in NOx and VOC emissions from No-Build to Build are shown in the regional analysis, roadway improvement measures (as required) are presented in Section 5.0 that are expected to minimize the increase.

6.5.2 National Ambient Air Quality Standards

The 1970 Clean Air Act was enacted by the U.S. Congress to protect the health and welfare of the public from the adverse effects of air pollution. As required by the Clean Air Act, EPA promulgated National Ambient Air Quality Standards (NAAQS) for these criteria pollutants: nitrogen dioxide (NO_2), SO_2, PM10 and PM2.5, CO, ozone (O_3), and lead (Pb). The NAAQS are listed in Table 6-3. Massachusetts Ambient Air Quality Standards (MAAQS) are typically identical to NAAQS. However, since the NAAQS are not incorporated into the MAAQS by reference, there can be differences if EPA promulgates new standards and there is delay in Massachusetts incorporating them into 310 CMR 6.04.

NAAQS specify concentration levels for various averaging times and include both "primary" and "secondary" standards. Primary standards are intended to protect human health, whereas secondary standards are intended to protect public welfare from any known or anticipated adverse effects associated with the presence of air pollutants, such as damage to vegetation. The more stringent of the primary or secondary standards were applied when comparing to the modeling results for the Project.

Table 6-3 National Ambient Air Quality Standards

Pollutant	*Averaging Period*	*National Ambient Air Quality Standards and Massachusetts Ambient Air Quality Standards (micrograms per cubic meter)*	
		Primary	*Secondary*
NO_2	Annual [1]	100	Same
	1-hour [7]	188	None
SO_2	Annual [1]	80	None
	24-hour [2]	365	None
	3-hour [2]	None	1,300
	1-hour [7]	195	None
PM10 [6]	Annual	50	Same
	24-hour [3]	150	Same
PM2.5	Annual [4]	12	15
	24-hour [5]	35	Same

Table 6-3 National Ambient Air Quality Standards (Continued)

Pollutant	*Averaging Period*	*National Ambient Air Quality Standards and Massachusetts Ambient Air Quality Standards (micrograms per cubic meter)*	
		Primary	*Secondary*
CO	8-hour [2]	10,000	Same
	1-hour [2]	40,000	Same
Ozone	8-hour [3]	235	Same
Pb	3-month [1]	1.5	Same

Notes:
[1] Not to be exceeded
[2] Not to be exceeded more than once per year.
[3] Not to be exceeded more than an average of one day per year over three years.
[4] Not to be exceeded by the arithmetic average of the annual arithmetic averages from 3 successive years.
[5] Not to be exceeded based on the 98th percentile of data collection.
[6] Due to a lack of evidence linking health problems to long-term exposure to coarse particle pollution, EPA revoked the annual PM10 standard in 2006 (effective December 17, 2006). However, the annual standard remains codified in 310 CMR 6.00
[7] Not to be exceeded. Based on the 3-yr average of the 98th (NO_2) or 99th (SO_2) percentile of the daily maximum 1-hour concentrations.
Source: 40 CFR 50 and 310 CMR 6.00

The NAAQS also reflect various durations of exposure. The short-term periods (i.e., 24 hours or less) refer to exposure levels not to be exceeded more than once a year. Long-term periods refer to limits that cannot be exceeded for exposure averaged over three months or longer.

The impacts from the Project were modeled and added to monitored background values and compared to the NAAQS. The modeling methodology was developed in accordance with the latest MassDEP modeling policies and Federal modeling guidelines.[3]

Modeling assumptions and backup data for results presented in this section are provided in Attachment H.

6.5.3 Existing Air Quality and Background Concentrations

6.5.3.1 Existing Local and Regional Air Quality

The Project is located in an urban area with residential land use to the south, commercial/industrial directly to the west, marshland to the east, and commercial land to the north. Massachusetts Route 1A is the major local roadway nearest to the Project site. Boston Logan International Airport's nearest operations are approximately 1.5 kilometers south of the Project site. The western edge of the property abuts a number of petroleum storage facilities (tank farms) as well as ocean oil tanker transfer ports.

[3] 40 CFR 51 Appendix W, Guideline on Air Quality Models, 70 FR 68228, Nov. 9, 2005

The Massachusetts Port Authority (Massport) completed its first round of ambient monitoring in 2010 as required in the MEPA certificate issued for the FEIR for the Logan Airside Improvements Project (LAIP), which included several airside improvements. The study was required relative to the construction of a new 9,300-foot-long centerfield taxiway running between the two major parallel runways 4 and 22.[4]

The study lasted 24 months, included three primary locations and eleven "satellite" locations, and focused on specific "air toxics" (VOCs, Carbonyls, Poly-Aromatic Hydrocarbons) and particulate matter (PM-2.5 and black carbon). A number of basic meteorological variables were also observed at two of the primary locations. The nearest monitoring locations to the Project site were located at Annavoy and Saratoga Streets (primary), Constitution Beach (satellite), and Bayswater Street (satellite). Concentrations of the targeted pollutants are presented, and exceedances of the 24-hour PM2.5 concentrations[5] against the "study benchmark" are shown at a monitor location directly adjacent to Logan Airport. Concentrations of speciated VOCs are mostly below benchmarks. These are commonly attributable to emissions from aircraft engines and tend to diminish quickly with increasing distance from the airport runways.

The Massachusetts Department of Public Health (MassDPH), with the help of Massport, has undertaken the Logan Airport Health Study. This study began about 13 years ago but was delayed due to funding problems in 2007. A draft report has not been released to the public. A final report was expected to be released in Spring 2013 but as of July 2013 had still not been released.

Tank farms are typical sources of fugitive VOCs and associated toxic air pollutants (e.g., benzene). VOCs are often emitted through tank vents during filling as the pollutant-laden air within the tanks is displaced by the petroleum liquid being stored. A number of petroleum storage tanks (not affiliated with Suffolk Downs or Caesars) are located near the Project site.

Another good measure of regional air quality in the area is MassDEP's local ambient monitoring network and pollutant concentrations compared to NAAQS. These values are discussed more in Section 6.5.3.2.

6.5.3.2 Background Concentrations

To estimate background pollutant levels representative of the area, the most recent air quality monitor data reported by MassDEP in Annual Air Quality Reports was obtained for 2007 to 2012. MassDEP guidance specifies the use of the latest three years of available monitoring data from within 10 km of the Project site.

---

[4] Massport, Logan International Airport Air Quality Monitoring Study, Baseline Year Report, August 2010

[5] Federal Reference Method (FRM) concentration at Saratoga & Annavoy Streets primary monitor station.

The Clean Air Act allows for one exceedance per year of the CO and SO_2 short-term NAAQS per year. Therefore, the second highest concentration accounts for the one allowed exceedance. Annual NAAQS are never to be exceeded. The 24-hour PM-10 standard is not to be exceeded more than once per year on average over three years. To attain the 24-hour PM-2.5 standard, the three-year average of the 98th percentile of 24-hour concentrations must not exceed 35 $\mu g/m^3$. For annual PM-2.5 averages, the average of the highest yearly observations was used as the background concentration. A new one-hour NO_2 standard was recently promulgated. To attain this standard, the 3-year average of the 98th percentile of the maximum daily one-hour concentrations must not exceed 188 $\mu g/m^3$.

Background concentrations were determined from the closest available monitoring stations to the proposed development. Since all pollutants are not measured at all monitors, the nearest monitor may change depending on the pollutant being measured. The closest monitors are located at 390 Parkland in Lynn, Kenmore Square in Boston, One City Square in Charlestown, and at 174 North Street in Boston's North End. A summary of the background air quality concentrations are presented in Table 6-4.

Table 6-4 Observed Ambient Air Quality Concentrations and Selected Background Levels

Poll.	*Avg. Time*	*2010*	*2011*	*2012*	*Back-ground Conc. ($\mu g/m^3$)*	*NAAQS ($\mu g/m^3$)*	*% of Std*	*Location*

Notes: From 2007-2012 MA DEP Annual Data Summaries

[1] SO_2 reported in ppm or ppb. Converted to $\mu g/m^3$ using factor of 1 ppm = 2600 $\mu g/m^3$.

[2] CO reported in ppm or ppb. Converted to $\mu g/m^3$ using factor of 1 ppm = 1140 $\mu g/m^3$.

[3] NO_2 reported in ppm or ppb. Converted to $\mu g/m^3$ using factor of 1 ppm = 1880 $\mu g/m^3$.

[4] Background level for 24-hour PM-2.5 is the average concentration of the 98th percentile for three years.

[5] Background level for annual PM-2.5 is the average for three years.

[6] Maximum annual 1-hr concentrations.

[7] The 24-hour and Annual standards were revoked by EPA on June 22, 2010, Federal Register 75-119, p. 35520.

[8] The 2010 & 2011 SO_2 3-hr value is not reported. Years 2007-2009 used instead. 2012 Annual SO_2 not reported; 2009 value used instead. 2012 AnnualPM10 not reported; 2009 value used instead. 2012 Annual NO_2 not reported; 2009 value used instead.

All nearby monitored concentrations in MassDEP's system are well below NAAQS.

For use in the microscale analysis, background concentrations of CO in parts per million (ppm) were required. The corresponding maximum background concentrations in ppm were 1.0 ppm for one-hour and 0.7 ppm for eight-hour CO.

6.5.4 Methodology

Air quality modeling methodology, utilized as explained in guidance set forth by the MassDEP and U.S. EPA, is outlined below.

6.5.4.1 Mesoscale/GHG Analysis

A mesoscale analysis is required to ensure that the proposed Project will not adversely impact the existing State Implementation Plan (SIP), which tracks how the state intends to maintain compliance with the NAAQS or plans for reductions in emissions to attain compliance in the future. A mesoscale analysis does not involve predictions of pollutant concentrations.

A mesoscale analysis predicts the change in regional ozone precursor emissions (i.e., NOx and VOCs) due to the Project. In addition, emissions of carbon dioxide (CO_2) are calculated for use in the GHG analysis presented in Section 7.0.

In accordance with MassDEP guidance[6], a mesoscale analysis is required for the following projects for which an ENF is filed under MEPA after May 1, 1991:

- any office project generating 3,000 or more ADT; and
- any other non-residential project generating 6,000 or more ADT.

A mesoscale analysis will be required for the following projects for which a decision on the adequacy of an EIR is issued under MEPA after May 1, 1991:

- any non-residential project generating 10,000 or more ADT.

A mesoscale analysis is required to ensure that a proposed project will not negatively impact the existing SIP. The SIP is created to track how the state intends to maintain compliance with NAAQS or to plan for future emissions reductions to attain compliance.

The analysis includes a comparison of the future Build conditions to the No-Build condition. If emissions are greater for the Build conditions, reasonable and feasible roadway improvement measures are to be evaluated. The methodology and parameters for the mesoscale analysis follow methodology approved by MassDEP.

---

[6] MassDEP, Guidelines For Performing Mesoscale Analysis Of Indirect Sources, May 1991

The mesoscale analysis predicts the change in regional ozone precursor emissions due to the proposed redevelopment of the Project sites. The total vehicle pollutant burden was estimated for the 2012 existing conditions and the No-Build and Build conditions for year 2022. Traffic conditions are described in more detail in Section 5.0.

Emissions Calculations (MOBILE6.2)

The EPA's MOBILE6.2 computer program was used to estimate motor vehicle emission factors of VOC and NOx (and CO_2 for GHG) on the roadway network in the Project area. Conservatively, emission factors derived from MOBILE6.2 for VOC and NOx (and CO_2) are based on the worst case of either wintertime or summertime conditions. Daily and yearly emission estimates were calculated using the vehicle count data, mileage between intersections, modeled signalized intersection delay times, and emission factors.

Traffic

The traffic volumes provided in Section 5.0 form the basis of the mesoscale study. Peak hour traffic volumes were provided by the transportation consultant. Estimates of ADT were made from the peak hour volumes assuming a 10% K-Factor. Average speeds were assumed for all links. Distances for the links were estimated with mapping software. A total of 107 roadway links were included in the analysis.

Average per-vehicle idle times were based on SYNCHRO output reports provided by the transportation consultant to calculate emissions from idling vehicles. Further idling on roadway links was included assuming a one-minute per hour per vehicle idling time. A total of 27 intersections were included in the analysis.

6.5.4.2 Microscale Analysis

The BRA requires an analysis of the effect on air quality of the increase in traffic generated by the Project. This "microscale" analysis is required for any intersection (including garage entrances/exits where the LOS is expected to deteriorate to D and the proposed Project causes a 10 percent increase in traffic or where the LOS is E or F and the proposed Project contributes to a reduction in LOS. The microscale analysis involves modeling CO emissions from vehicles idling at and traveling through both signaled and unsignalized intersections. Predicted ambient concentrations of CO for the Build and No Build cases are compared with NAAQS and MAAQS for CO.

The microscale analysis typically examines ground-level CO impacts due to traffic queues in the immediate vicinity of a project. CO is used in microscale studies to indicate roadway pollutant levels since it is the most abundant pollutant emitted by motor vehicles and can result in so-called "hot spot" (high concentration) locations around congested intersections. The NAAQS standards do not allow ambient CO concentrations to exceed 35 ppm for a one-hour averaging period and 9 ppm for an eight-hour averaging period, more than once

per year at any location. The widespread use of CO catalysts on current vehicles has reduced the occurrences of CO hotspots. Air quality modeling techniques (computer simulation programs) are typically used to predict CO levels for both existing and future conditions to evaluate compliance of the roadways with the standards. The analyses for the Project followed the procedure outlined in U.S. EPA's intersection modeling guidance.[7]

The microscale analysis has been conducted using the latest versions of EPA MOBILE6.2, CAL3QHC, and AERMOD to estimate CO concentrations at sidewalk receptor locations.

Baseline (2012) and future year (2022) emission factor data calculated from the MOBILE6.2 model, along with traffic data, were input into the CAL3QHC program to determine CO concentrations due to traffic flowing through the selected intersections. AERMOD was used to estimate potential ground-level impacts due to emissions from the combustion sources.

Existing background values of CO at the nearest monitor location in Kenmore Square were obtained from the MassDEP. CAL3QHC and AERMOD results were then added to background CO values of 1.9 ppm (one-hour) and 1.5 ppm (eight-hour), as provided by the MassDEP, to determine total air quality impacts due to the Project. This value was compared to the NAAQS for CO of 35 ppm (one-hour) and 9 ppm (eight-hour).

Emissions Calculations (MOBILE6.2)

The EPA MOBILE6.2 computer program was used to estimate motor vehicle emission factors on the roadway network. Emission factors calculated by the MOBILE6.2 model are based on motor vehicle operations typical of daily periods. The Commonwealth's statewide annual Inspection and Maintenance (I&M) program was included, as well as the state specific vehicle age registration distribution. The input files for MOBILE6.2 for the existing (2012) and build year (2022) are provided by MassDEP. As is typical, minor edits to the files were necessary to allow the program to output emission factors for the various speeds used in the analyses.

Idle emissions can be obtained from a vehicle speed of 2.5 mph (the lowest speed MOBILE6 will model). The resulting emission rate given in (grams/mile) is then multiplied by 2.5 mph to estimate idle emissions (in grams/hour). Moving emissions are calculated based on actual speeds at which free-flowing vehicles travel through the intersections. A speed of 30 mph is used for all free-flow traffic. Speeds of 10 and 15 mph were used for right (and U-turns, if necessary) and left turns, respectively.

Winter CO emission factors are typically higher than summer for CO. Therefore, winter vehicular emission factors were conservatively used in the microscale analyses.

---

[7] U.S. EPA, Guideline for Modeling Carbon Monoxide from Roadway Intersections; EPA-454/R-92-005, November 1992.

Intersection Selection

As stated previously, a "microscale" analysis is required for a project at intersections where (1) project traffic would impact intersections or roadway links currently operating at LOS D, E, or F or would cause LOS to decline to D, E, or F; (2) project traffic would increase traffic volumes on nearby roadways by 10% or more (unless the increase in traffic volume is less than 100 vehicles per hour); or (3) a project will generate 3,000 or more new ADT on roadways providing access to a single location.

Given the large number of intersections meeting the above criteria, it was necessary to determine the worst intersections to analyze. Through consultation with transportation engineers, it was determined that the following intersections are the worst performing intersections with the most Project-related traffic and were selected to be modeled:

- the intersection of Route 1A, Route 60, Route 16, Beach Street, and Everett Street (Bell Circle);
- the intersection of Route 1A and Boardman Street;
- the intersection of Revere Street and Route 60;
- the intersection of Route 145 (Winthrop Avenue), Route 16, and Harris Street; and
- the intersection of Route 145 (Winthrop Avenue), North Shore Road, and Tomasello Drive.

Since the intersection of Route 1A and Boardman Street is planned to undergo a significant physical change, and this change will also affect the intersection of Waldemar Avenue and the South Site Driveway with Route 1A, these intersections were included in the analysis of Route 1A and Boardman Street in the Build cases.

Microscale modeling was performed for the intersections based on the aforementioned methodology. The 2012 existing conditions, 2022 No Build conditions, and 2022 Build and Build with HCA Improvements conditions were each evaluated.

Receptors & Meteorology Inputs

Sets of up to 600 receptors were placed in the vicinity of each of the modeled intersections and spaced every five meters. Receptors extended approximately 200 to 300 feet on the sidewalks along the roadways approaching the intersection. Roadway links and receptor locations of the modeled intersections are presented in Figures 6-22 through 6-27. For the CAL3QHC model, limited meteorological inputs are required. Following EPA

guidance[8], a wind speed of 1 m/s, stability class D (4), and a mixing height of 1,000 meters was used. To account for the intersection geometry, wind directions from 0° to 350°, every 10° were selected. A surface roughness length of 175 cm was selected for all intersections.[9]

Impact Calculations

The CAL3QHC model predicts one-hour concentrations using queue-links at intersections, worst-case meteorological conditions, and traffic input data. The one-hour concentrations were scaled by a factor of 0.7 to estimate 8-hour concentrations.[10] The CAL3QHC methodology was based on EPA CO modeling guidance. Signal timings were provided directly from the traffic modeling outputs. The CAL3QHC input parameters are also described in Attachment H.

6.5.4.3 Stationary Source Analysis

AERMOD

The most recent version of the U.S. EPA AERMOD refined dispersion model (Version 12345) was selected to predict concentrations from the stationary sources related to the Project. AERMOD is the U.S. EPA's preferred model for regulatory applications. The use of AERMOD provides the benefits of using the most current algorithms available for steady state dispersion modeling.

The AERMOD View graphical user interface (GUI) Version 8.2.0, created by Lakes Environmental, was used to facilitate model setup and post-processing of data. The AERMOD model was selected for this analysis because it:

- is the required U.S. EPA model for all refined regulatory analyses for receptors within 50 km of a source;
- is a refined model for facilities with multiple sources, source types, and building-induced downwash;
- uses actual representative hourly meteorological data;

[9] U.S. EPA, *User's Guide for CAL3QHC Version 2: A Modeling Methodology for Predicting Pollutant Concentrations Near Roadway Intersections*. EPA –454/R-92-006 (Revised), September 1995.

[10] U.S. EPA, Screening Procedures for Estimating the Air Quality Impact of Stationary Sources; EPA-454/R-92-019, October 1992.

- incorporates direction-specific building parameters which can be used to predict impacts within the wake region of nearby structures;

- allows the modeling of multiple sources together to predict cumulative downwind impacts;

- provides for variable emission rates;

- provides options to select multiple averaging periods between one-hour and one year (scaling factors can be applied to adjust the one-hour impact to a peak impact less than one-hour); and

- allows the use of large Cartesian and polar receptor grids, as well as discrete receptor locations.

Regulatory default options adopted for the model include the options described below.

- *Use stack-tip downwash (except for building downwash):* Stack-tip downwash is an adjustment of the actual stack release height for conditions when the gas exit velocity is less than 1.5 times the wind speed. For these conditions, the effective release height is reduced a bit, based on the diameter of the stack and the wind and gas exit velocity. This option applies to point sources only, such as emergency generators, cooling towers, boiler units and garage vents.

- *Use the missing data and calms processing routines:* The model treats missing meteorological data in the same way as the calms processing routine (i.e., it sets the concentration values to zero for that hour, and calculates the short term averages according to U.S. EPA's calms policy, as set forth in the Guideline). Since only one-hour averages are being used, concentrations predicted with calm or missing data would not affect model results.

The AERMOD model is able to assign sources to a rural or urban category to allow specified urban sources to use the effects of increased surface heating under stable atmospheric conditions. The urban dispersion classification was selected based on a visual inspection of the area within a three-kilometer radius of the Project site. A population estimate of 1,118,961 was obtained from the U.S. Census website (www.census.gov) for the Boston area and surrounding cites of Brookline, Cambridge, Chelsea, Everett, Malden, Revere, Somerville and Winthrop. This value was used in the AERMOD model to estimate the urban boundary layer height.

The regional meteorology in Boston is best approximated with meteorological data collected by the nearby Boston Logan International Airport in East Boston. The station is located approximately 2.3 miles (3.7 km) east of the Project site at an elevation of 15 feet (4.57 m) above mean sea level. This station is the closest site for which extensive meteorological data are available which are representative of similar topographic influences

that affect the proposed sites. Five years (2007-20011) of hourly surface data collected at the station include wind speed and direction, temperature, cloud cover and ceiling height. Upper air data from Gray, Maine was processed along with the surface data. The processed meteorological files for use in AERMOD were provided by the MassDEP. These files have been used on other AERMOD applications in the area for review by MassDEP and are presumed to be of sufficient quality for regulatory applications.

A network of 2,197 receptors was used for the refined AERMOD modeling analysis. A nested grid of Cartesian receptors centered on the Project was used. The entire modeling domain encompassed 132.25 square kilometers (11.5 by 11.5 kilometers). The spacing of the receptors was as follows:

- a one-kilometer square area surrounding the Project site with receptors spaced every 25 meters;
- a 500-meter area extending from the initial one-kilometer square area with receptors spaced every 100 meters;
- a 500-meter area extending from the 1.5-kilometer square area with receptors spaced every 250 meters;
- a one-kilometer area extending from the two-kilometer square area with receptors spaced every 500 meters; and
- a three-kilometer area extending from the three-kilometer square area with receptors spaced every 1,000 meters.

Receptors falling on Resort building footprints were removed from the analysis.

Terrain data were obtained from the U.S.G.S National Map Seamless Server (www.seamless.usgs.gov) according to guidance set forth by EPA.[11] Receptor elevations were processed using the AERMAP processor by way of the Lakes AERMOD View interface. Figure 6-28 presents the source and receptor locations, as well as the buildings used in the GEP stack height/downwash analysis described below.

Sources

Stationary sources of air pollution are typically units that combust fuel. In this case, these sources consist of heating units and electrical generating units. The Project also includes a CHP (also called "cogeneration") facility. Cooling towers, although not a combustion source, are a source of particulate emissions and are included in the analysis.

[11] U.S. EPA, AERMOD Implementation Guide, March 19, 2009.

Current plans include a number of small condensing boilers for heat and domestic hot water. All units will be natural gas-fired and located in a penthouse mechanical area on the roof of the building. The units are expected to be exhausted through individual stacks. The current design includes four heating boilers at 6 MMBtu/hour (heat input) each. The boilers will be within requirements of the MassDEP's Environmental Results Program (ERP) since individual estimated heat inputs are within or below the 10 to 40 MMBtu/hour ERP range. However, emissions were conservatively estimated for each boiler based on the MassDEP Boiler ERP program emission limits. Dispersion modeled impacts from the heating units were estimated from exhaust stacks 10 feet above the building roof heights (48 feet above ground level). For all impacts, the heating equipment is assumed to be in operation 24 hours per day, seven days per week.

Current design plans include emergency generators to be installed next to the CUP building to be constructed. The units will provide life safety and standby emergency power to the buildings. The units will be diesel-fired and located in a mechanical area to the northeast of the CUP building. The generator is assumed to be designed such that its exhaust stack extends at least 10 feet above the unit enclosure height (23.75 feet above ground level). The current design includes two 2,000 kilowatt emergency generators.

Typically, the generators will operate for approximately one hour each month for testing and general maintenance. The ERP regulation applies to new emergency generators greater than 37 kW. The regulation is similar to the boiler ERP in that new engines are subject to emission standards, recordkeeping, certification, and compliance with the MassDEP noise policy. Since the generator maximum rating capacity is greater than the ERP limit of 37 kW, it will be subject to the new ERP program. Per the ERP, the generator owner will limit operation of the generator to less than 300 hours per year and submit a certification form to MassDEP within 60 days of installation.

Emissions were estimated for the emergency generators based on vendor supplied data. Comparable equipment was assumed when not provided by the architects or design engineers. The generators are assumed to operate 300 of 8,760 hours per year in the modeling for annual averaging times.

Current plans call for cooling towers to be installed in the mechanical area northeast of the building. These units will remove the excess heat generated by the buildings' mechanical equipment. All units will be located on the roofs of the buildings. The current design includes three 3,000-ton single-celled cooling towers.

Only emissions of PM are assumed to be produced by the cooling tower cells. The cooling towers are assumed to operate at 100% capacity for 8,760 hours per year. Emissions of all other pollutants from the cooling towers are expected to be negligible.

Emissions and exhaust parameters were based on vendor supplied data and/or engineering judgment.

A CHP system is planned for the Project. A system includes a natural gas-fired reciprocating engine to provide power while collecting the waste heat energy to produce steam for other uses, mainly heating. The currently-planned system consists of two natural gas-fired reciprocating engines and heat recovery units capable of producing a combined 100 kilowatts of power each. It is assumed to exhaust from the roof of the building. The unit is assumed to operate 8,760 hours per year.

Emissions and exhaust parameters were based on vendor supplied data and/or engineering judgment. Since this is not considered final design, all sources and parameters are subject to change and final configurations will be permitted through MassDEP as necessary.

GEP Stack Height Analysis

The Good Engineering Practice (GEP) stack height evaluation of the facility has been conducted in accordance with the EPA revised Guidelines for Determination of Good Engineering Practice Stack Height (EPA, 1985). A GEP stack is sufficiently high to avoid aerodynamic downwash effects from nearby buildings or structures. As defined by the EPA guidelines, the formula for computing GEP stack height is the greater of:

1. 65 meters, or

2. for stacks constructed after January 12, 1979,

$$H_{GEP} = H_b + 1.5L$$

where H_{GEP} = GEP stack height,

H_b = Height of adjacent or nearby structures,

L = Lesser of height or maximum projected width of adjacent or nearby building (*i.e.*, the critical dimension), and nearby is within 5L of the stack from downwind (trailing edge) of the building.

The GEP formula was applied to each input building. EPA's Building Profile Input Program Prime Version (BPIP-Prime) was run to confirm the GEP height and to calculate direction-specific building dimensions for use in AERMOD.

The point sources subject to building influences are the boiler stacks, cooling towers, CHP, and emergency generator stacks.

The proposed boiler stacks, cooling towers, and emergency generator stacks are all below GEP height; therefore, building downwash effects were considered in the air quality modeling. The AERMOD model determines when and if to include downwash in its calculations. In addition, if downwash applies, the AERMOD downwash algorithm will be used to estimate concentrations in the building cavity areas.

6.5.5 Air Quality Analysis Results

The following sections present results of the air quality analyses.

6.5.5.1 Mesoscale Analysis

Results of the regional emissions calculations as part of the mesoscale analysis are presented in Tables 6-5 and 6-6.

The decrease in total emissions from Existing 2012 to 2022 No-Build, even with the modest increases in traffic VMT and delay times, is attributable to anticipated improvements in vehicle engine and emissions technologies, which are expected to reduce per-vehicle emission rates.

Table 6-5 Regional Mesoscale (Indirect) Emissions Analysis Summary (No-Build versus Existing)

Pollutant	*VOC (lbs/day)*	*VOC (tons/yr)*	*NOx (lbs/day)*	*NOx (tons/yr)*
2012 Existing	340.7	53.2	690.0	107.6
2022 No Build	238.9	37.3	239.4	37.4
Difference	-101.8 -29.9%	-15.9 -29.9%	-450.6 -65.3%	-70.3 -65.3%

For Build conditions, shown in Table 6-6, the 2022 Build condition shows increases of NOx and VOC emissions compared to 2022 No Build conditions. Primarily due to trip (VMT) increases, results show increases of approximately 7% in VOCs and 8% in NOx emissions.

Table 6-6 Regional Mesoscale (Indirect) Emissions Analysis Summary (Build versus No-Build)

Pollutant	*VOC (lbs/day)*	*VOC (tons/yr)*	*NOx (lbs/day)*	*NOx (tons/yr)*
2022 No Build	238.9	37.3	239.4	37.4
2022 Build	255.3	39.8	259.3	40.4
Difference	16.4 6.9%	2.6 6.9%	19.8 8.3%	3.1 8.3%

Transportation Improvement Measures

The Proponent has identified and reviewed reasonable and feasible HCA improvement measures to address traffic impacts and the resulting minimal increase in emissions associated with the 2022 Build scenario. Section 5.0 provides a description of the HCA improvements as well as the TDM program that will be implemented to reduce vehicle trips. The Proponent is committed to implementing transportation management improvements to minimize potential impacts to the transportation system including signal improvements at area intersections, encouraging alternative modes of travel, and rideshare programs. Proposed transportation-related improvement measures are further described in Section 5.0.

The HCA improvements on Route 16 are expected to divert trips from the two-mile stretch of Route 60 between Route 1 and Routes 16/145 (just south of Bell Circle) to the 1.25-mile stretch of Route 16 from Route 1 to Route 145, resulting in a significant reduction of VMT annually. Combined with reductions in delay at other intersections, the improvements are expected to reduce emissions from the Build condition.

6.5.5.2 Microscale Analysis

Results of the maximum one-hour predicted CO concentrations from CAL3QHC are provided in Tables 6-7 through 6-10 for the 2012 and 2022 scenarios. Eight-hour average concentrations are calculated by multiplying the maximum one-hour concentrations by a factor of 0.7.[12]

Results of the one-hour and eight-hour maximum modeled CO ground-level concentrations from CAL3QHC were added to EPA-supplied background levels for comparison to NAAQS. These values represent the highest potential concentrations at the intersection as they are predicted during the simultaneous occurrence of "defined" worst case meteorology. The highest one-hour traffic-related concentration predicted in the Project area, for the modeled

[12] U.S. EPA, Screening Procedures for Estimating the Air Quality Impact of Stationary Sources; EPA-454/R-92-019, October 1992

conditions (4.2 ppm) plus background (1.0 ppm) is 5.2 ppm for the 2022 Friday afternoon peak hour case at the intersection of Routes 1A, 16, and 60 (Bell Circle) for multiple conditions. The highest eight-hour traffic-related concentration predicted in the Project area for the modeled conditions (2.9 ppm) plus background (0.7 ppm) is 3.6 ppm at the same intersection for the same conditions. All concentrations are well below the one-hour NAAQS of 35 ppm and the eight-hour NAAQS of 9 ppm.

Physical roadway improvements (memorialized in the HCAs) would be made to improve intersections in the Project vicinity. Significant improvements would be made to the intersection of Routes 16 and 145, while minor improvements would be made to Bell Circle and the North Site Driveway area. Microscale results including these improvements are shown in Table 6-10.

6.5.5.3 Stationary Source Analysis

The AERMOD dispersion model was used to evaluate the expected air quality impacts due to emissions from the Project's stationary sources. Local background concentrations, determined from the ambient monitoring data, are added to model results and compared to the applicable National Ambient Air Quality Standards for each pollutant and averaging period. Table 6-11 presents the results of the stationary source analysis. Compliance is demonstrated with the NAAQS for all pollutants and averaging periods.

Table 6-11 Summary of Stationary Source Modeling Analysis

Pollutant	*Averaging Time*	*Max Modeled Conc. ($\mu g/m^3$)*	*Modeled Year*	*Background Concentration ($\mu g/m^3$)*	*Total Conc. ($\mu g/m^3$)*	*Standard ($\mu g/m^3$)*	*% Of Standard*

6.5.6 Conclusions

6.5.6.1 Mesoscale Analysis

Although results of the mesoscale analysis show increases in NO_x and VOC emissions, the quantitative values (in tons per year) are relatively small (~3 tons per year) between No-Build and Build cases. With the HCA improvements, reductions of NOx and VOCs are expected from the Build case.

6.5.6.2 Microscale Analysis

Results of the microscale analysis show that all predicted CO concentrations are well below one-hour and eight-hour NAAQS. Therefore, it can be concluded that there are no adverse air quality impacts resulting from increased traffic in the area.

6.5.6.3 Stationary Source Analysis

Results of the stationary source air quality dispersion modeling analysis show that all predicted concentrations are well below the NAAQS. Therefore, it can be concluded that the stationary sources associated with the Project will not cause or contribute to a violation of the NAAQS.

6.5.7 Stationary Source Permitting

It is expected that the majority of stationary sources (e.g., boilers, engines) would either be exempt from or subject to MassDEP's Environmental Results Program (ERP). However, with the integration of larger sources (such as CHP), other air quality regulations may apply if total emissions exceed thresholds for other air pollution control requirements, including Massachusetts minor source preconstruction approvals (NMCPA), New Source Review (NSR), Operating Permits, and Prevention of Significant Deterioration (PSD).

6.5.7.1 Combined Heat and Power

Depending on the unit's final design size and operating conditions, the CHP system could be permitted under the ERP regulations (310 CMR 7.26) or under the Plan Approval regulations (310 CMR 7.02). Operating restrictions could allow the system to be permitted under the ERP and require the facility to submit a self-certification to MassDEP after installation. The Plan Approval process requires consultation with and approval by MassDEP before construction. Both permits require full compliance with all applicable air quality standards.

6.5.7.2 Boilers

Projects typically include a number of small condensing boilers for heat and domestic hot water. All units are often natural gas-fired and located in a penthouse mechanical area on the roofs of buildings. The units are typically exhausted through individual stacks.

The boilers will likely be within the requirements of the ERP since individual estimated heat inputs would be within or below the 10 to 40 million British Thermal Units per hour (MMBtu/hr) ERP range. If boilers are below the ERP limits of 10 MMBtu/hr, registration with MassDEP would not be required.

6.5.7.3 Emergency Generators

Emergency generators are required to provide life safety and standby emergency power to the buildings. The units are often diesel-fired and located in a mechanical area on the roofs of buildings. The generators are required to be designed such that exhaust stacks extend at least 10 feet above the individual building roof height above ground level.

Typically, generators will operate for approximately one hour each month for testing and general maintenance. The ERP regulation applies to new emergency generators greater than 37 kW. The regulation is similar to the boiler ERP in that new engines are subject to emission standards, recordkeeping, certification, and compliance with MassDEP noise policy. Since the generators' maximum rating capacities are likely to be greater than the ERP limit of 37 kW, they will be subject to the new ERP program. Per the ERP, the generator owner will be required to limit operation of the generator to less than 300 hours per year and submit a certification form to MassDEP within 60 days of installation.

6.5.7.4 Parking Garage Exhausts

According to local building codes and best construction practices, CO monitors will be installed within any underground levels in the parking garages to ensure that CO levels do not exceed health standards and to control abatement ventilation when necessary. Compliance will be certified by local inspection authorities.

6.5.8 General Air Quality Mitigation Measures

Pollutant emissions from the Project will be reduced in a variety of ways. Stationary sources will be required to comply with applicable emission regulations promulgated for the specific sources. Diesel emergency generators will be required to meet emission performance standards as specified in 40 CFR 89 and/or 310 CMR 7.26(42). Heating boilers subject to ERP will be required to meet emissions limits specified in 310 CMR 7.26(33)(b). Sources not meeting these emission limits will require aftermarket pollution control.

Curbside vehicle idling of taxis, shuttle buses, and private vehicles will be limited to five minutes. Massachusetts state laws (M.G.L. Chapter 90, Section 16A and M.G.L. Chapter 90, Section 16B) and MassDEP regulations [310 CMR 7.11(1)(b)] limit vehicle idling to no more than five minutes in most cases. A vehicle may idle longer only if absolutely necessary. There are exceptions for vehicles being serviced, vehicles making deliveries that need to keep their engines running (to power refrigerators, for example), and vehicles that need to run their engines to operate accessories (such as power lifts). MassDEP provides tools for both facilities and fleets to use to discourage curbside idling.

6.5.9 Construction Air Quality

See the Draft CMP in Attachment L for air quality mitigation from construction activities.

6.6 Noise

This section describes the noise analysis conducted for the Project. The analysis includes a baseline noise-monitoring program to determine existing background levels and an estimate of future noise impacts from stationary sources (i.e., mechanical equipment), mobile sources (i.e., traffic), and construction activities associated with the Project. Predicted

sound levels are compared to existing background levels, and impacts are evaluated against the City of Boston Zoning District Noise Standards, MassDEP Noise Policy, U.S. EPA guidelines, HUD Environmental Criteria and Standards, and FHWA Noise Abatement Criteria.

Summary of Analysis: Baseline noise levels were measured in the vicinity of the proposed Project and were compared to predicted stationary-source noise levels based on information provided by the manufacturers of representative mechanical equipment or estimated from the equipment's capacity. With appropriate mitigation, the Resort is expected to meet City of Boston and MassDEP noise limits as well as the recommended EPA and HUD guidelines. In addition, a mobile source analysis of future traffic impacts indicates that sound levels due to increases in traffic volumes associated with the Resort will meet the applicable FHWA noise criteria at each of the nearest residences and community receptors. Furthermore, an analysis of construction noise resulting from the operation of diesel-powered equipment indicates that the Resort is expected to meet the applicable City of Boston construction noise limits during daytime construction hours.

6.6.1 Noise Terminology

There are several ways in which sound (noise) levels are measured and quantified, all of which use the logarithmic decibel (dB) scale. The following information defines the noise terminology used in this analysis.

The decibel scale is logarithmic to accommodate the wide range of sound intensities observed in the environment. A property of the decibel scale is that the sound pressure levels of two distinct sounds are not purely additive. For example, if a sound of 50 dB is added to another sound of 50 dB, the total is only a three-decibel increase (53 dB), not a doubling (100 dB). Thus, every three-decibel change in sound level represents a doubling or halving of sound energy. Related to this is the fact that a change in sound level of less than three dB is generally imperceptible to the human ear.

Another property of the decibel scale is that if one source of noise is 10 dB (or more) louder than another source, then the total combined sound level is simply that of the louder source (i.e., the quieter source contributes negligibly to the overall sound level). For example, a source of sound at 60 dB plus another source at 47 dB is 60 dB.

The sound level meter used to measure noise is a standardized instrument.[13] It contains "weighting networks" to adjust the frequency response of the instrument to approximate that of the human ear under various conditions. One network is the A-weighting network (there are also B- and C-weighting networks), which most closely approximates how the

[13] *American National Standard Specification for Sound Level Meters*, ANSI S1.4-1983, published by the Standards Secretariat of the Acoustical Society of America, Melville, NY.

human ear responds to sound as a function of frequency, and is the accepted scale used for community sound level measurements. Sounds are frequently reported as detected with the A-weighting network of the sound level meter, in dBA. A-weighted sound levels emphasize the middle frequencies (*i.e.,* middle pitched – around 1,000 Hertz sounds), and de-emphasize lower- and higher-frequencies.

Because the sounds in our environment vary with time, they cannot simply be represented with a single number. In fact, there are several methods used for quantifying variable sounds which are commonly reported in community noise assessments, as defined below.

- L_{eq}, the equivalent level, in dBA, is the level of a hypothetical steady sound that would have the same energy (*i.e.,* the same time-averaged mean square sound pressure) as the actual fluctuating sound observed.

- L_{90} is the sound level, in dBA, exceeded 90 percent of the time in a given measurement period. The L_{90}, or residual sound level, is close to the lowest sound level observed when there are no obvious nearby intermittent noise sources.

- L_{50} is the median sound level, in dBA, exceeded 50 percent of the time in a given measurement period.

- L_{10} is the sound level, in dBA, exceeded only 10 percent of the time in a given measurement period. The L_{10}, or intrusive sound level, is close to the maximum sound level observed due to occasional louder intermittent noises, like those from passing motor vehicles.

- L_{max} is the maximum instantaneous sound level observed in a given measurement period.

By employing various noise metrics it is possible to separate prevailing, steady sounds (the L_{90}) from occasional louder sounds (L_{10}) in the noise environment. In the design of noise controls, which do not function quite like the human ear, it is important to understand the frequency spectrum of the noise source of interest. The spectra of noises are usually stated in terms of octave-band sound pressure levels, in dB, with the octave frequency bands being those established by standard. To facilitate the noise-control design process, the estimates of noise levels in this analysis are also presented in terms of octave-band sound pressure levels.

6.6.2 Noise Regulations and Criteria

6.6.2.1 City of Boston Zoning District Noise Standards

The primary set of regulations relating to the potential increase in noise levels is the City of Boston Zoning District Noise Standards (City of Boston Code – Ordinances: Section 16–26 Unreasonable Noise and City of Boston Air Pollution Control Commission Regulations for

the Control of Noise in the City of Boston). Separate regulations within the Standards provide criteria to control different types of noise. Regulation 2 is applicable to the effects of stationary sources associated with the proposed Project, as completed. Table 6-12 includes maximum allowable sound pressure levels per the Zoning District Standards.

Regulation 3 is applicable to the effects of noise associated with the proposed Project during construction. Lot line noise limits for construction devices are shown in Table 6-13.

In addition, according to the City of Boston Noise Ordinance, Section 16-26.5 (Ord. 1985 c. 3 §1 [354d]), *"it shall be unlawful to operate any construction device(s), including but not limited to impact devices, on any construction site if the operation of such device(s) emits noise, measured at the lot line of a residential lot in excess of 50 dBA between the hours of 6:00 PM and 7:00 AM."*

Table 6-12 City of Boston Zoning District Noise Standards

Octave-band Center Frequency (Hz)	Residential Zoning District Daytime (dB)	Residential Zoning District All Other Times (dB)	Residential-Industrial Zoning District Daytime (dB)	Residential-Industrial Zoning District All Other Times (dB)	Business Zoning District Anytime (dB)	Industrial Zoning District Anytime (dB)

Notes: Noise standards are extracted from Regulation 2.5, City of Boston Air Pollution Control Commission, "Regulations for the Control of Noise in the City of Boston", adopted December 17, 1976.
All standards apply at the property line of the receiving property.
dB and dBA based on a reference sound pressure of 20 micropascals.
'Daytime' refers to the period between 7:00 am and 6:00 pm daily, excluding Sunday.

Table 6-13 City of Boston Restrictions on Noise Emitted from Construction Sites

Lot Use of Affected Property	L10 Level	Maximum Noise Level
Residential or Institutional	75 dBA	86 dBA
Business or Recreational	80 dBA	-
Industrial	85 dBA	-

Notes:
Noise standards are extracted from Regulation 3.1, City of Boston Air Pollution Control Commission, "Regulations for the Control of Noise in the City of Boston", adopted December 17, 1976.
All standards apply at the property line of the receiving property, no closer than 50 feet from the nearest active construction device on the construction site.
These standards are not applicable to impact devices.

As further defined by the City of Boston Noise Ordinance Section 16-26.1 (Ord. 714 § 354; Ord. 1991 c. 4 § 1), *"Unreasonable or excessive noise shall mean...noise measured in excess of 50 dBA between the hours of 11:00PM and 7:00AM, or in excess of 70 dBA at all other hours."*

6.6.2.2 MassDEP Noise Policy

MassDEP has the authority to regulate noise under 310 CMR 7.10, which is part of the Commonwealth's air pollution control regulations. According to MassDEP regulations, "unnecessary" noise is considered an air contaminant and thus is prohibited by 310 CMR 7.10. MassDEP administers this regulation through Noise Policy DAQC 90-001, which limits a source to a 10-dBA increase above the L_{90} ambient sound level measured at the Project property line and at the nearest residences. MassDEP policy further prohibits "pure tone" conditions where the sound pressure level in one octave-band is three dB or more greater than the sound levels in each of two adjacent bands.

6.6.2.3 U.S. EPA Guidelines

Another useful publication for evaluating sound levels is the *Information on Levels of Environmental Noise Requisite to Protect Public Health and Welfare with an Adequate Margin of Safety* (U.S. Environmental Protection Agency, Office of Noise Abatement and Control, Washington, DC, 550/9-74-004, March 1974). This report, often referred to as the "Levels" document, recommends an outdoor L_{dn} of 55 dBA (or equivalent L_{eq} of 48.6 dBA) in residential areas as the level below which no effects on public health or welfare would be expected to occur due to the interference of speech or other activities. This guideline, which incorporates a 10 dBA "penalty" for sound levels at night (10 p.m. to 7 a.m.), was developed to promote normal speech communication and protect against sleep interference inside a home with windows open.

6.6.2.4 HUD Environmental Criteria and Standards

The HUD Environmental Criteria and Standards (24 CFR Part 51), Subpart B – Noise Abatement and Control specifies noise criteria for HUD-funded housing developments. The HUD exterior noise goal for residential construction is a day-night average sound level (L_{dn}) of 65 dBA or less. This is considered "Acceptable." L_{dn} sound levels above 65 dBA but not exceeding 75 dBA are considered "Normally Unacceptable," and L_{dn} levels above 75 dBA are considered "Unacceptable." Funding for HUD approvals in 'Normally Unacceptable' areas require a minimum of 10 dB of additional sound attenuation for buildings having noise-sensitive uses. The HUD interior noise goal is an L_{dn} of 45 dBA.

6.6.2.5 U.S. DOT FHWA Noise Abatement Criteria

The U.S. Department of Transportation (DOT) Federal Highway Administration's (FHWA) Code of Federal Regulations (CFR), Title 23, Part 772 specifies hourly A-weighted noise abatement criteria (NAC) applicable to the assessment of traffic noise impacts at receivers classified by "Activity Category," as shown in Table 6-14.

Table 6-14 U.S. Department of Transportation FHWA Noise Abatement Criteria (NAC) Hourly A-Weighted Sound Level Decibels (dBA)[1]

Activity Category	Activity Criteria[2]		Evaluation Location	Activity Description
	$L_{eq}(h)$	$L_{10}(h)$		
A	57	60	Exterior	Lands on which serenity and quiet are of extraordinary significance and serve an important public need and where the preservation of those qualities is essential if the area is to continue to serve its intended purpose
B[3]	67	70	Exterior	Residential
C[3]	67	70	Exterior	Active sport areas, amphitheaters, auditoriums, campgrounds, cemeteries, day care centers, hospitals, libraries, medical facilities, parks, picnic areas, places of worship, playgrounds, public meeting rooms, public or nonprofit institutional structures, radio studios, recording studios, recreation areas, Section 4(f) sites, schools, television studios, trails, and trail crossings

1. Either Leq(h) or L10(h) (but not both) may be used on a project.
2. The Leq(h) and L10(h) Activity Criteria values are for impact determination only, and are not design standards for noise abatement measures.
3. Includes undeveloped lands permitted for this activity category

Table 6-14 U.S. Department of Transportation FHWA Noise Abatement Criteria (NAC) Hourly A-Weighted Sound Level Decibels (dBA)[1] (Continued)

D	52	55	Interior	Auditoriums, day care centers, hospitals, libraries, medical facilities, places of worship, public meeting rooms, public or nonprofit institutional structures, radio studios, recording studios, schools, and television studios
E[3]	72	75	Exterior	Hotels, motels, offices, restaurants/bars, and other developed lands, properties or activities not included in A-D or F
F	--	--	--	Agricultural, airports, bus yards, emergency services, industrial, logging, maintenance facilities, manufacturing, mining, rail yards, retail facilities, shipyards, utilities (water resources, water treatment, electrical), and warehousing
G	--	--	--	Undeveloped lands that are not permitted

1. Either Leq(h) or L10(h) (but not both) may be used on a project.
2. The Leq(h) and L10(h) Activity Criteria values are for impact determination only, and are not design standards for noise abatement measures.
3. Includes undeveloped lands permitted for this activity category

6.6.3 Existing Conditions

6.6.3.1 Baseline Noise Environment

The Proponent has conducted an ambient sound level measurement program to document existing "baseline" conditions surrounding the proposed Project. Existing noise sources include: vehicular traffic on local roadways, trains, aircraft, birds, wind and leaf noise, pedestrian conversation and foot traffic, rooftop and residential mechanical equipment located on the surrounding buildings, and sound from the loudspeaker at the existing Suffolk Downs racetrack.

6.6.3.2 Noise Monitoring Locations

Noise monitoring locations were selected upon a review of zoning and land-use in the area to represent the existing noise levels at sensitive residential receptors north, east, and south of the Project. Three long-term, continuous noise monitoring locations were selected as representative sites to obtain a sampling of the ambient baseline noise environment on-site. In addition, three short-term monitoring stations were selected to represent off-site conditions in the surrounding elevated residential neighborhoods to the north (Crescent Heights), east (Beachmont), and south (Orient Heights). The locations of all six monitoring stations, described below, are presented in Figure 6-29 and Table 6-15.

- **Location LT-1** is along the southern Project property line at the southernmost tip of the Suffolk Downs racetrack, approximately eight feet from the fence. This location was selected to represent the property line closest to residences south of the Project along Waldemar Avenue (Boston).

- **Location LT-2** is along the eastern Project property line within the horse stable area, approximately 10 feet from the fence. This location was selected to represent sound levels at the property line closest to residences east of the Project along Washburn Avenue (Revere).

- **Location LT-3** is at the northern corner of the Project property line within a clearing between the Stop & Shop and Revere Beach Parkway. This location was selected to represent sound levels at the property line closest to residences north of the Project along Northshore Road (Revere).

- **Location ST-1** is south of the Project at the intersection of Beach View Road and Orient Avenue (Boston). This location was selected to represent the residential Orient Heights neighborhood.

- **Location ST-2** is east of the Project in front of #103 Crest Avenue (Revere). This location was selected to represent the residential Beachmont neighborhood.

- **Location ST-3** is north of the Project between #30 and #34 Clark Road (Revere). This location was selected to represent the residential Crescent Heights neighborhood.

Table 6-15 GPS Coordinates – Sound Level Measurement Locations

Location	Latitude	Longitude
LT-1 Southern Property Line	42.39122°	70.99945°
LT-2 Eastern Property Line	42.39692°	70.99353°
LT-3 Northern Property Line	42.40043°	70.99772°
ST-1 Orient Avenue (Boston)	42.39023°	71.00219°
ST-2 Crest Avenue (Revere)	42.39688°	70.98792°
ST-3 Clark Road (Revere)	42.40201°	70.99488°

6.6.3.3 Noise Monitoring Methodology

The background monitoring program was designed to document the variability of sound levels within the Project area throughout the course of a day, evening, and night, including both weekdays and weekends. The measurement period was also selected to capture horse racing events held at the existing Suffolk Downs racetrack.

Approximately six days of continuous ambient sound level monitoring was conducted from Friday, October 5, 2012 to Thursday, October 11, 2012 at three long-term sites (LT-1, LT-2, and LT-3). Continuous broadband (dBA) and one-third octave-band sound level measurements were made at all three of these locations where the sound level meters logged data, including L_{eq}, L_{max}, L_{10}, L_{50}, and L_{90} sound levels, every 20 minutes with a one-minute time history. The meters were housed in an environmental suitcase and were connected to a microphone fitted with the manufacturer's environmental windscreen that was mounted on a tripod at a height of approximately five feet (1.5 meters) above ground. These measurements were generally unattended, although the field technician checked on the equipment and recorded ambient noise sources three times during the program: upon deployment (daytime); during the quietest nighttime period between midnight and 4 a.m.; and upon demobilization (daytime). During the month of October 2012, live horse racing took place each Monday, Wednesday, and Saturday beginning at 12:45 p.m. Three horse racing periods occurred within the measurement period.

Additional short-term sound level measurements were taken for 20 minutes per location during the daytime (11:30 a.m. to 1:30 p.m.) on Thursday, October 11, 2012, and during nighttime hours (12:00 a.m. to 2:00 a.m.) on Wednesday, October 10, 2012. Since noise impacts are greatest at night when existing noise levels are lowest, the study was designed to measure community noise levels under conditions typical of a "quiet period" for the area. Daytime measurements were scheduled to exclude peak traffic conditions while coinciding with a live horse racing event.

All short-term measurements were made at publicly accessible locations at a height of five feet (1.5 meters) above ground level, under low wind conditions, and with dry roadway surfaces. Wind speed measurements were made with a Davis Instruments TurboMeter electronic wind speed indicator, and temperature and humidity measurements were made using a General Tools digital psychrometer. Unofficial observations of meteorology or land use in the community were made solely to characterize the existing sound levels in the area and to estimate the noise sensitivity at properties near the proposed Project.

Meteorological data from the closest National Weather Service station in Boston (Logan International Airport, KBOS) were archived for the duration of the measurement period and field-verified during the short-term measurements. Sound level data collected from October 5 to October 11, 2012 were evaluated against these conditions and any time measurement periods occurring during precipitation events were discarded.

6.6.3.4 Noise Monitoring Equipment

Four Larson Davis Model 831 sound level meters equipped with a PRM831 Type I Preamplifier, a 377B20 half-inch microphone, and manufacturer-provided windscreen were used to collect long-term and short-term background sound pressure level data. This instrumentation meets the "Type 1 - Precision" requirements set forth in American National Standards Institute (ANSI) S1.4 for acoustical measuring devices. The measurement equipment was calibrated in the field before and after the surveys with a Larson Davis CAL200 acoustical calibrator which meets the standards of IEC 942 Class 1L and ANSI S1.40-1984. Statistical descriptors (e.g., L_{eq}, L_{90}) were calculated for each 20-minute sampling period, with one-third octave-band sound levels corresponding to the same data set processed for the broadband levels.

6.6.3.5 Measured Background Noise Levels

The continuous L_{90} and L_{eq} sound level data for Locations LT-1 through LT-3 are plotted in Figures 6-30 and 6-31, respectively, along with periods of precipitation as reported by the National Weather Service in Boston.

It can be seen from Figure 6-30 that residual L_{90} sound levels at the long-term sites ranged from 30 dBA during the quietest nighttime hours to 60 dBA during the day. Typical nighttime L_{90} sound levels ranged from approximately 40 to 45 dBA depending on location while daytime L_{90}'s ranged from approximately 45 to 55 dBA. While occasional sound from the Suffolk Downs racetrack loudspeaker was audible during horse racing events, there was no significant increase in the residual sound levels at any of the short-term monitoring locations due to the races.

A summary of the baseline noise monitoring results for the selected study periods considered in this analysis are presented in Table 6-16. A tabular summary of the short-term background measurements is presented in Table 6-17.

Table 6-16 Summary of Background Sound Level Measurements

6.6.4 Future Conditions

6.6.4.1 Stationary Sources

Overview of Potential Project Stationary Noise Sources

The primary sources of continuous sound due to stationary sources exterior to the Project will include ventilation, cooling, central utility and emergency power noise sources. Two energy recovery units (ERUs) will be located on the roof of the Hotel I building, each surrounded by eight-foot-tall screening walls. The roof of Casino Area II will contain up to three air handling units (AHUs) surrounded by a screening wall approximately 15 feet tall, a single ERU, and six to ten kitchen exhaust fans. Ten to twelve kitchen exhaust fans will also be located on the roof of Casino Area I. The CUP will contain two 100 kW cogen engines assumed to be well-controlled within a windowless building with acoustically louvered openings. Both engines will exhaust vertically through the roof of the CUP building with ten-foot stacks fitted with critical grade exhaust silencers. Four cooling towers and two emergency diesel generators will be located at ground level adjacent to the CUP, surrounded on all sides by barrier walls approximately 20 feet tall. Both emergency generators will be housed in dedicated weather-proof, sound-attenuating enclosures exhausted vertically through 15-foot stacks fitted with critical grade exhaust silencers. It is assumed that these generators will only operate during the day for brief, routine testing when background sound levels will be higher or during an emergency interruption of the electrical grid when other rooftop mechanical equipment will not be operating.

Other secondary and interior noise sources including hot water heaters, chillers, boilers, and pumps, are not considered in this analysis to contribute significantly to the overall sound level. Stair pressurization fans will be for emergency use only and are not included as steady sources of mechanical noise. The parking garage will be naturally ventilated.

A tabular summary of the modeled mechanical equipment proposed for the Project is presented in Table 6-18. Sound power level data for each unit, as provided by the manufacturer or calculated from provided sound pressure level data, is presented in Table 6-19. Sound power levels of those units for which data was not provided were assumed based on data for similar or representative equipment. Approximate locations of the mechanical equipment were provided by the Project team in a preliminary roof plan.

Additional mitigation will be applied to multiple sources as needed to ensure compliance with applicable noise regulations. Attributes of the emergency generator enclosures and exhaust silencers are described in Tables 6-20 through 6-22. To further limit impacts, the required periodic routine testing of emergency generators should be scheduled during daytime hours when background sound levels will be highest.

Noise Modeling Methodology

Noise impacts from mechanical equipment associated with the Project were predicted using Cadna/A noise calculation software (DataKustik Corporation, 2005). This software, which uses the ISO 9613-2 international standard for sound propagation (Acoustics - Attenuation of sound during propagation outdoors - Part 2: General method of calculation), offers a refined set of computations accounting for local topography, ground attenuation, drop-off with distance, barrier shielding, diffraction around building edges, reflection off building facades, and atmospheric absorption of sound from multiple noise sources.

An initial analysis considered all of the mechanical equipment without the emergency generators running to simulate typical nighttime operating conditions at nearby receptors. A second analysis combined the mechanical equipment and the emergency generators to reflect worse-case daytime conditions during brief, routine, testing of the generators. Both analyses conservatively assume all mechanical equipment will be operating simultaneously and at full load.

Noise Modeling Results & Evaluation

In the first modeling scenario, the analysis of sound levels at night considered all of the stationary mechanical equipment without the emergency generators running to simulate typical nighttime operating conditions at nearby receptors. In the second modeling scenario, the analysis combined sound emissions from the mechanical equipment and the emergency generators to reflect worse-case conditions during brief, routine, daytime testing of the generators when ambient levels are higher. Ten modeling locations with a height of 1.5 meters above grade were included in both analyses, consisting of the nearest noise sensitive receptors and residential neighborhoods, and were evaluated against the applicable daytime or nighttime background sound levels and noise limits. Figure 6-32 shows the locations of each modeled receptor as well as the monitoring locations selected for background measurements.

In both scenarios, the predicted future sound levels (Project plus background) are well below the MassDEP criteria of 10dBA over the measured background L_{90} sound levels at all sensitive receptor locations. This evaluation, with and without emergency generators, is presented in Tables 6-23a and b, respectively. No background sound level measurements were conducted near receptors R8 through R10, which were selected only to evaluate mobile source impacts (see Section 6.6.4.2). As such, no compliance evaluation with MassDEP policy was possible for stationary sources at these locations, which are absent from Tables 6-23a and b. In addition, modeled sound levels from stationary mechanical equipment are predicted to be within the most stringent broadband and octave-band residential zoning limits for the City of Boston at the closest residential receptors. This evaluation is presented with and without emergency generators in Tables 6-24a and b, respectively, which also show stationary noise sources are not expected to create any "pure-tone" conditions as defined by MassDEP at these locations.

With appropriate mitigation (listed below), the Resort is not expected to introduce significant outdoor mechanical equipment noise into the surrounding community.

The recommended mitigation efforts included in the analysis are as follows:

- Each emergency generator should be fitted with a critical-grade exhaust silencer and sound-attenuating enclosure. Routine testing of generators should be scheduled during daytime hours only when background sound levels are higher.

- The CUP cogen engine exhaust ducts should be fitted with critical-grade exhaust silencers, and any proposed ventilation openings in the CUP building should contain acoustical louvers.

- Noise barrier walls should enclose the CUP cooling towers and emergency generators as well as the rooftop air handling units and energy recovery units associated with Hotel I and Casino Area II.

Results of this analysis indicate that noise levels from the Resort at the nearest receptors will be equal to or below the City of Boston Noise Zoning requirements based on land-use, and will comply with all MassDEP A-weighted and tonal noise limits. Worst-case operations are also expected to meet the U.S. EPA guideline of 48.6 dBA which is equal to an Ldn of 55 dBA during the quietest nighttime hours. Even with the emergency generators running, all Ldn sound levels from the Project will be less than 60 dBA and will not significantly increase the existing Ldn in the Project area. Therefore, the Resort will not affect the area's compliance with the HUD Residential Site Acceptability Standards after the Project is complete.

At this time, mechanical equipment and noise controls are conceptual in nature and, during final Project design, will be specified to meet the applicable City of Boston, MassDEP, and HUD noise limits. Additional mitigation may include the selection of quieter units, acoustical louvers, screening walls, mufflers, or equipment enclosures, as needed.

6.6.4.2 Mobile Sources

Overview of Potential Project Mobile Noise Sources

Major off-site roadways in the immediate Project vicinity applicable to this analysis include: Route 1A, Waldemar Avenue, Boardman Street (with proposed Route 1A infrastructure improvements), Bennington Street, and Winthrop Avenue (Route 145). Noise impacts from increased vehicle activity on primary onsite roadways including Tomasello Drive and Blue Line Drive were also considered. A detailed description of existing and future Project noise sources relating to traffic can be found in Section 5.0.

Noise Modeling Methodology

Traffic noise calculations were conducted using the Federal Highway Administration's Traffic Noise Model (FHWA TNM 2.5) software which computes the sound propagation between roadways and nearby receptors using cruise-throttle vehicle noise emission levels based on vehicle type and speed. This mobile source analysis allowed for consideration of geometric divergence, atmospheric absorption, and acceleration of vehicles following traffic-control devices including stop signs and traffic signals.

Traffic data consisting of hourly traffic volumes, vehicle speed, and the distribution of automobiles and heavy trucks was used as input in the noise model. Off-site and existing onsite roadway centerlines were derived from the official state-maintained MassGIS street transportation dataset, while future onsite roadways and traffic control device locations were provided by the Project team in a proposed site plan. Traffic data for existing conditions used in this noise analysis were obtained from automated traffic counts taken in July 2012, October 2012 and June 2013. Projections of traffic volumes were provided for assessing future conditions. A summary of the existing and future traffic data used in the evaluation is presented in Tables 6-25 and 6-26, respectively.

Based on a review of both hourly and daily traffic distributions, the following two scenarios were selected for evaluation:

1) Friday 8:00 PM – 9:00 PM represents the single hour corresponding to the greatest number of patron arrivals and departures within a given week. This modeling scenario considers "worst-case" absolute sound levels due to the highest traffic volumes.

2) Saturday 3:00 AM – 4:00 AM represents the hour of greatest increase over existing sound levels measured during the background study. This modeling scenario considers noise impacts due to relatively high traffic volumes observed during relatively quiet nighttime periods.

Noise Modeling Results & Evaluation

Table 6-27 presents the modeling results for the two selected scenarios under existing and future traffic conditions at each of the receptor locations identified in Figure 6-32. All noise levels computed represent an hourly A-weighted equivalent sound level, or Leq(h), in dBA.

Table 6-27 Mobile Source Modeling Results

Receptor ID	Friday 8:00 PM - 9:00 PM			Saturday 3:00 AM - 4:00 AM		
	Existing Leq(h)	*Future Leq(h)*	*Difference*	*Existing Leq(h)*	*Future Leq(h)*	*Difference*
	dBA	dBA	dBA	dBA	dBA	dBA
R1	64	64	0	56	57	1
R2	58	59	1	50	52	2
R3	59	59	0	50	51	1
R4	66	67	1	57	59	2
R5	52	53	1	43	45	2
R6	55	55	0	45	48	3
R7	52	53	1	44	47	3
R8	64	67	3	57	60	3
R9	67	68	1	61	62	1
R10	65	65	0	59	59	0

Results of this analysis indicate that traffic noise from mobile sources associated with the proposed Project will not result in a significant impact on nearby sensitive receptors. As seen in Tables 6-25 and 6-26, the increase in traffic volumes for off-site roadways is expected to be minimal (less than 50% of existing volumes). For perspective, a doubling of source sound emissions (corresponding to a 100% increase in traffic volumes) would result in a three decibel increase in received sound pressure levels (see Section 6.6.1 for further explanation). Onsite roadways will accommodate a more substantial increase in vehicle traffic volumes, however the increase in community sound levels at the closest residences and quietest neighborhoods are predicted to be no more than three dBA louder than experienced today, as seen in Table 6-27. A comparison with the relevant FHWA Noise Abatement Criteria for residential receptors indicates that, without mitigation, worst-case predicted sound levels from future traffic volumes will be equal to or less than the noise limit of 67 dBA specified in Table 6-14 on an hourly, A-weighted basis.

6.6.4.3 Construction

Overview of Potential Project Construction Noise Sources

The Project includes a combination of new construction, redevelopment of existing buildings, retention of existing infrastructure and facilities, and demolition. The Project also includes construction of access drives, parking lots, sidewalks, utilities (water, gas, storm, sewer, electric), and extensive landscaping. The proposed construction process, expected to commence in Spring 2014, has been designed around site constraints to isolate construction activities while providing safe access for pedestrians and automobiles during normal daily activities, and is expected to last for a duration of approximately 26 months.

Typical construction hours will be between 6:00 a.m. and 7:00 p.m. Monday through Saturday. Sunday and/or 3rd shift activities will be the exception, and will be performed in a manner that will minimize noise impacts. Some activities, such as materials unloading, will need to be performed during off hours; however, no truck idling, construction activity, or staging outside of the construction site fencing will be allowed between the hours of 6:00 p.m. and 7:00 a.m. Within the site, activities such as excavation, pile driving, and steel erection will also be prohibited during these hours to minimize noise impacts.

A schedule of proposed construction activities, broken down into periods of three to six months, is provided in Table 6-28. Each activity has been categorized into one of five discrete phases of construction, as defined by the U.S. EPA[14], and described below:

- Ground Clearing;
- Excavation;
- Foundations;
- Erection; and
- Finishing.

[14] U.S. Environmental Protection Agency,"Noise from Construction Equipment and Operations, Building Equipment, and Home Appliances",Table 1-b, December 31, 1971.

Table 6-28 Proposed Schedule of Construction Activities

Construction Activity	*EPA Category* Name
Month 1-5	
Install Erosion Control/Environmental Protection	Ground Clearing
Demo & Prep for New Maintenance Building	Ground Clearing
Temp Road	Ground Clearing
Reclaim Asphalt	Ground Clearing
Prep Sub Compound	Ground Clearing
Crushing Area	Excavation
CUP Piles	Foundation

Temp Road	Ground Clearing
Surface Parking Utilities & Prep	Excavation
Roadwork & Utility Relocation	Excavation
Garage/Casino Piles & Foundations	Foundation
Phase 1 CUP Structure	Foundation/Erection
Complete New Maintenance Building	Erection
Month 8-14	
Construction Laydown & Crane Locations	Ground Clearing
Queuing for Precast Trailers	Ground Clearing
Prep for Patron Parking	Excavation
Roadwork & Utility Relocation	Excavation
Garage/Casino Area II Structure	Erection
Casino CUP Fitout	Finishing
Month 14-17	
Landscaping	Excavation
Porte Corchere Main Entry	Erection
Stage II Complete Façade	Erection
Loading & Hoist	Erection
Casino CUP Fitout	Finishing
Casino & CUP Operational	Finishing
Garage Fit & Finish	Finishing
Month 17-26	
Landscaping	Excavation
Porte Corchere Fit & Finish	Erection
Casino Fit/Finish & Construction Access	Finishing

While the exact pieces of equipment used at the Project site have yet to be finalized, typical earthmoving activities will include highly mobile excavating equipment (e.g., backhoes, bulldozers, shovels, front loaders) as well as road-building machinery (e.g., compactors, scrapers, graders, pavers). Other activities will involve partly-mobile materials-handling equipment (e.g., cranes, mixers, concrete pumps), pneumatically or hydraulically-powered impact machinery (e.g., jack hammers, rock drills, pile drivers), and stationary sources (e.g., pumps, generators, compressors).

Table 6-29 presents a list of reference sound levels for each EPA construction activity category used as input in the noise model. These sound levels represent typical ranges of noise levels at construction sites in urban areas due to equipment operations associated with each activity category, as defined by the EPA.

Table 6-29 Reference Sound Pressure Levels for Typical Building Construction Activities

EPA Category	*Sound Pressure Level[1,2], dBA*
Ground Clearing	84
Excavation	89
Foundation	78
Erection	85
Finishing	89

1. Reference sound pressure level at 50 feet (energy average) for "Industrial, Parking Garage, Religious, Amusement & Recreations, Store, Service Station" construction sites, ALL pertinent equipment present at site
2. Source: U.S. Environmental Protection Agency,"Noise from Construction Equipment and Operations, Building Equipment, and Home Appliances",Table 1-b, December 31, 1971

Noise Modeling Methodology

Noise impacts associated with Project construction were predicted using Cadna/A noise calculation software (DataKustik Corporation, 2005). This software, which implements the ISO 9613-2 international standard for sound propagation (Acoustics - Attenuation of sound during propagation outdoors - Part 2: General method of calculation), offers a refined set of computations accounting for local topography, ground attenuation, drop-off with distance, reflection, barrier shielding, and atmospheric absorption of sound from multiple sound sources.

A site-wide noise model was developed for each construction period using the activity schedule presented in Table 6-28 along with site plans illustrating construction phasing and staging locations on the Project site (see Section 6.12 and referenced plans). All equipment associated with a given construction activity was assumed to be collocated within the relevant work area. While the location of individual pieces of equipment will vary depending on operations, source locations were modeled to represent routine construction operations from the Project site. Sound levels from construction activities were modeled at the same set of receptor locations evaluated in both the stationary and mobile source analyses representing the closest receptors in the Project vicinity.

Noise Modeling Results & Evaluation

Table 6-30 presents the predicted sound levels due to Project construction at each of the modeling locations shown in Figure 6-32 along with a comparison to the City of Boston 70 dBA daytime limit. The results indicate that predicted sound levels from construction within the proposed Project site are not anticipated to cause a significant noise impact and are expected to meet the relevant City of Boston daytime construction noise criteria at all noise-sensitive locations. If required, a waiver of the City of Boston nighttime limits will be sought for any work performed between the hours of 6 a.m. to 7 a.m. and 6 p.m. to 7 p.m.

Table 6-30 Received Sound Pressure Levels Due to Project Construction

R10	46	46	45	45	40
City of Boston Noise Limit	**70**	**70**	**70**	**70**	**70**

While the locations assumed for each construction activity were chosen to be representative, there will be times when some of the mobile sources associated with ground clearing and excavation will be closer to the southern Project property line, resulting in elevated sound levels up to 80 dBA at some of the residences along Waldemar Avenue. However, as with other forms of facility construction, this work will be transient and thus the duration of potential daytime construction noise effects at a given residence will be limited. Predicted sound levels based on the assumption that all activities proposed within a given period are concurrent, and that all equipment associated with a given activity will be collocated, are conservative. In practice, many of the activities modeled cumulatively will occur at different times, equipment will be spread out within each work area, and not all equipment will operate simultaneously at full load. In addition, the majority of the construction will occur in areas well removed from residences or other sensitive receptors.

With respect to traffic, the daily workforce will arrive prior to peak traffic periods and will be encouraged to utilize public transportation. Personal vehicles will be allowed to park within designated areas at the Project site, and no construction vehicle parking will be

allowed in adjacent neighborhoods where streets will remain open to the public during the construction period. Therefore, traffic associated with jobsite personnel is not expected to result in a significant noise impact.

Measures recommended to minimize the noise impact of construction activities include:

- Scheduling work during daytime hours, with construction hours planned from 6:00 a.m. to 7:00 p.m., including "start-up" time;
- Using appropriate mufflers on all equipment and providing ongoing maintenance of intake and exhaust mufflers;
- Maintaining muffler enclosures on continuously operating equipment, such as air compressors and welding generators;
- Replacing specific construction operations and techniques with less noisy ones where feasible and practical;
- Selecting the quietest practicable equipment (e.g., electric instead of diesel-powered equipment);
- Selecting equipment operations to keep average noise levels low, to synchronize the noisiest activities with times of highest ambient noise levels, and to maintain relatively uniform noise levels;
- Locating noisy equipment at locations that protect sensitive locations by shielding or distance; and
- Turning off idle equipment.

6.6.5 Conclusions

Baseline noise levels were measured in the vicinity of the proposed Project and were compared to predicted stationary-source noise levels based on information provided by the manufacturers of representative mechanical equipment or estimated from the equipment's capacity. With appropriate mitigation the Resort is expected to meet the City of Boston and MassDEP noise limits as well as the recommended EPA and HUD guidelines. Additionally, a mobile source analysis of future traffic impacts indicates that sound levels due to increases in traffic volumes associated with the Resort will meet the applicable FHWA noise criteria at each of the nearest residences and community receptors. Furthermore, an analysis of construction noise resulting from the operation of diesel-powered equipment indicates that the Resort is expected to meet the applicable City of Boston construction noise limits during daytime construction hours.

In conclusion, results of these analyses indicate that predicted sound levels due to stationary mechanical equipment, increased traffic volumes, and temporary construction activities are not anticipated to cause a significant noise impact on the surrounding community, and, with appropriate mitigation, are expected to meet relevant noise limits at all noise-sensitive locations.

6.7 Public Benefit Review and Determination

In November 2007, the Massachusetts House and Senate passed An Act Relative to the Licensing Requirements for Certain Tidelands (HB 4324), which was signed by Governor Patrick on November 15, 2007 (Chapter 168 of the Acts of 2007) as the "Landlocked Tidelands Legislation." The legislation, among other things, names the Secretary of EEA as the "administrator of tidelands," and requires the Secretary to conduct a "public benefit review" for projects located on tidelands and to issue a written determination (the "Public Benefit Determination"). The Secretary must conduct a public benefit review for any proposed project located on tidelands or on landlocked tidelands that requires an EIR pursuant to MEPA.

6.7.1 Nature of Affected Tidelands

As evidenced by Attachment F of the ENF, MassDEP determined that the Project site is not subject to Chapter 91 licensing jurisdiction and the only tidelands on the Project site are landlocked tidelands. In the agency's comment letter on the ENF, MassDEP affirmed this prior determination. Pursuant to Chapter 168 of the Acts of 2007 and accompanying regulatory changes, the portion of the site that constitutes landlocked tidelands is subject to an analysis of its public benefits as well as any impacts on the public trust rights to access, use, and enjoy tidelands that are protected by Chapter 91.

6.7.2 Public Benefit of Project

In making the Public Benefit Determination, the Landlocked Tidelands Legislation requires that the Secretary consider the following:

> *"Purpose and effect of the development, the impacts on abutters and the surrounding community; enhancement to the property, benefits to the public trust rights in tidelands or other associated rights, including but not limited to, benefits provided through previously obtained municipal permits; community activities on the development site; environmental protection and preservation; public health and safety; and the general welfare; provided further that the secretary shall also consider the differences between tidelands and landlocked tidelands and great ponds when assessing the public benefit and shall consider the practical impact of the public benefit on the development."*

As described in Section 1.6, the Project offers numerous public benefits. The following sections describe these public benefits in the terms required by the Landlocked Tidelands legislation.

6.7.2.1 Purpose and Effect of the Development

The Project is proposed to redevelop the 161-acre site of Suffolk Downs into a Caesars-branded world-class resort and casino at New England's only thoroughbred racetrack. The $1 billion development plan includes hotel, entertainment, restaurant, luxury spa, and retail spaces as well as continued operations at the Suffolk Downs racetrack. In addition, the Project includes plans to improve the track's racing facilities and provide millions of dollars in funding to reduce longstanding transportation concerns and to make improvements to the local road network.

6.7.2.2 Impact on Abutters and Surrounding Community

The design for the Resort has been thoroughly reviewed in numerous meetings with abutters to the Project site and is expected to have an overall positive impact on the surrounding community.

The Resort will bring major new investment to the cities of Boston and Revere, increase governmental revenue, and create construction jobs as well as new permanent employment opportunities for residents of the host cities and other local communities. Furthermore, pursuant to Chapter 23K, a portion of the taxes on the proposed Resort's gross gaming revenue will be allocated to a community mitigation fund, from which the Massachusetts Gaming Commission will allocate funds to the host and surrounding communities to address potential Project impacts. In addition to new jobs, public funding, and direct investment at Suffolk Downs, the proposed Resort will promote small business and the tourism industry and have positive economic effects on the cities and the Commonwealth of Massachusetts. Locating a Category 1 gaming establishment at Suffolk Downs will permit tourists to enjoy both the gaming establishment and the unique cultural and social resources of Boston and Revere, and will result in additional enjoyment of and support for those resources.

Consistency with planning initiatives and municipal zoning are discussed in Sections 3.4 and 3.5, respectively.

Project development will benefit local water quality by significantly improving the quality of stormwater discharged from the Project site relative to existing conditions by incorporating a mix of low-impact development (LID) and conventional Best Management Practices (BMPs) into the site design to provide water quality treatment (see Section 9.3). In addition, proposed transportation improvements described in Section 5.0 will address existing historic and background traffic issues of concern to the community and the region, and will have significant positive effects on abutters and the surrounding community.

Construction-period impacts will be avoided and minimized through a series of Best Management Practices (BMPs) as described in the Draft CMP in Attachment L.

Furthermore, and in accordance with Section 9(a)(8)(ii) of Chapter 23K, the Proponent shall provide on-site space for an independent substance abuse and mental health counseling service for a provider identified by the Massachusetts Gaming Commission.

6.7.2.3 Enhancement to Property

The property is currently home to Suffolk Downs, which opened in 1935 and remains New England's only operating thoroughbred racetrack. Much of the Project site, however, contains surface parking, and as such is underutilized.

As proposed, the Project will redevelop the site into a Caesars-branded world-class resort and casino. The Project is a $1 billion economic development initiative that will bring significant new investment to the cities of Boston and Revere and will create thousands of new jobs. Proposed redevelopment plans will significantly improve site access (for vehicles and bicycles as well as pedestrians), surrounding roads, and stormwater management.

6.7.2.4 Benefits to Public Trust Rights in Tidelands or Other Associated Rights

As described above, a portion of the Project site is located on filled Private Tidelands that have been determined to be Landlocked Tidelands (see Attachment F of the ENF, reaffirmed in the MassDEP comment letter on the ENF); the Project site does not contain any jurisdictional tidelands. Redevelopment proposed on the Project site will largely displace existing surface parking, and will not displace any water-dependent uses. Furthermore, the Project is separated from flowed tidelands by several interconnecting roadways.

The Project will provide the following public benefits:

- Creation of New Publicly-Accessible Open Space: The Project design creates a number of high-quality open spaces that will establish aesthetically-pleasing entrances to the Resort, provide the public with areas for outdoor enjoyment, and establish outdoor green spaces suitable for entertainment and other events (see Figure 1-38). As proposed, the Project design will increase open space by approximately 16 acres relative to existing conditions.

- Streetscape Improvements: The Project will also enhance the landscape and pedestrian experience along Winthrop Avenue, another front door to the Project site. Pedestrian accommodations at the Tomasello Drive intersection will be significantly improved by the introduction of concurrent pedestrian phasing and the provision of a new "missing" crosswalk on Winthrop Avenue east of Tomasello Drive. In addition, traffic and pedestrian safety improvements will be implemented in Donnelly Square, which will incorporate streetscape improvements on the east of

Beachmont Station. The Project will also provide plantings to provide shade and visual interest at the edge of the neighborhood as well as an attractive new fence along the Resort edge.

- Public Transit Improvements: The Project will improve access to the MBTA Blue Line Suffolk Downs Station, including upgraded pedestrian, bicycle, and shuttle connections to the Resort. The Proponent has also agreed to Suffolk Downs Station improvements, each of which remains subject to further negotiation and discussion with the MBTA:

    - Maintenance improvements including concrete restoration and repair of the existing structure, ramps, stairs, overpass, and platform as well as repainting;

    - Installation of two new ADA-compliant elevators, along with associated foundations, structure, and improvements;

    - Three new turnstiles; and

    - Various site improvements including new sidewalks, ramps, railings, lighting, way-finding, and landscaping, along with a pedestrian shelter located at the entrance to the Project site.

- Active Uses: Ground levels of the proposed Resort buildings are designed to activate the public realm with daytime and nighttime uses. For example, restaurant, entertainment, and retail spaces will promote activity throughout the day and night, and the Project site connections with existing MBTA Suffolk Downs and Beachmont Stations will encourage pedestrian activity and a sense of neighborhood continuity.

- Recreation: The Proponent has agreed to provide on-street bicycle accommodations to connect Constitution Beach, Belle Isle Marsh, and Revere Beach along the Bennington Street corridor, along with connections to and through the Project site from the Suffolk Downs MBTA station and from Winthrop Avenue. This network will effectively create pedestrian and bicycle loop systems that will enhance public access to open space and will improve access to a walkway in the Belle Isle Marsh that is being constructed as part of a separate project associated with a U.S. EPA consent order in accordance with a plan developed by the Friends of Belle Isle Marsh. In addition, the Proponent has agreed to provide two Hubway bicycle stations, one near the Suffolk Downs MBTA Station and one near the south entry to Casino Areas I and II, when the network expands into East Boston. On-site pedestrian paths and aesthetically-pleasing open spaces will encourage pedestrian activity and access, including at the site entries. The pedestrian connection from Orient Heights will be maintained.

- Enhancement of public access to tidelands of a unique and high quality: The Proponent is responsible for additional improvements that will promote better public access to DCR's park at the 241-acre salt marsh, the only remaining salt marsh in Boston.

- Drainage Improvements: The Project will significantly improve stormwater management on the Project site and thus improve the water quality within Sales Creek.

6.7.2.5 Community Activities on the Development Site

The Project will create a number of high-quality open spaces that will establish aesthetically-pleasing entrances to the Resort, provide the public with areas for outdoor enjoyment, and establish outdoor green spaces suitable for education, entertainment, and other events. In addition, the Project will improve pedestrian and bicycle accommodations and will provide ground-floor retail space.

The Proponent has demonstrated a commitment to community support and activities. For example, the Project site currently functions as a community gathering location for a variety of public activities and events with attendance levels in the thousands. These events include:

- Starting point of half marathon;
- Food Truck Festival;
- Greater Boston Walk Now For Autism Speaks;
- Assembly area for Columbus Day Parade (even years);
- Kentucky Derby Day;
- Preakness Stakes Day;
- Opening Day of the live racing season;
- Belmont Stakes Day; and
- Breeders' Cup Saturday.

6.7.2.6 Environmental Protection and Preservation

The Project consists of redeveloping surface parking lots and renovating existing buildings into a world-class resort and casino at New England's only thoroughbred racetrack. The Project will comply with the applicable environmental regulatory programs of the Commonwealth. Regulatory programs specifically applicable to this Project and the status of the Project with respect to these programs are summarized below.

- *The Massachusetts Environmental Policy Act (MEPA).* This Draft EIR follows the January 31, 2013 submission of an ENF and issuance of the Secretary's Certificate on April 5, 2013. The Proponent anticipates filing a Final EIR with the MEPA Office before completing MEPA review.

- *The Massachusetts Wetlands Protection Act (WPA).* A Notice of Intent (NOI) will be filed with each of the Conservation Commissions in Boston, Revere, and Chelsea describing jurisdictional activities associated with Project construction. The Project will contribute to the protection of the interests identified in the WPA by complying with the applicable general performance standards.

- *Massachusetts Historical Commission State Register Review.* The Project is subject to review by the MHC in compliance with MGL Chapter 9 §§ 26-27C as amended by St. 1988, c. 254. Consultation with MHC was initiated with the filing of the ENF.

The balance of this section discusses the Project in terms of development review components, and as such addresses potential Project impacts and mitigation measures to avoid and minimize such impacts.

6.7.2.7 Public Health and Safety, and General Welfare

The Project will enhance public health and safety as well as the general welfare in a number of ways, including providing significant transportation-related improvements not only on the immediate Project site but also in the surrounding neighborhoods. These improvements, such as the proposed Route 1A infrastructure improvements, will address existing historic and background traffic issues of concern to the community.

The Project will also provide streetscape improvements and high-quality open spaces that will establish aesthetically-pleasing entrances to the resort, provide the public with areas for outdoor enjoyment, and establish outdoor green spaces suitable for entertainment and other events. Enhanced bicycle access, including on-street bicycle accommodations to connect Constitution Beach with Belle Isle Marsh and Revere Beach, will encourage walking and cycling.

As noted previously, the Project will significantly improve stormwater management on site by incorporating a mix of LID and conventional BMPs into the site design to provide water quality treatment and improve the water quality discharged ultimately into Boston Harbor (see Section 9.3).

Furthermore, pursuant to the HCAs with Boston and Revere and in accordance with Section 9(a)(8)(ii) of Chapter 23K, the Proponent shall provide on-site space for an independent substance abuse and mental health counseling service for a provider identified by the Massachusetts Gaming Commission.

As described in Section 1.6, the Project will provide numerous significant public benefits, many of which will boost economic development and enhance annual property tax revenues for the Cities of Boston and Revere. Approximately 2,500 construction jobs and more than 4,000 permanent jobs will be created as a result of the proposed development.

6.8 Consistency with Policies of the Office of Coastal Zone Management

As currently proposed, the Project does not require any federal actions that are subject to the CZM federal consistency requirement. This fact notwithstanding, the Project site is located within the coastal zone and therefore information demonstrating consistency with CZM's enforceable policies is provided herein.

The Proponent certifies to CZM that the Project complies with the enforceable policies of the approved Massachusetts Coastal Zone Management Plan and will occur in a manner consistent with such policies. This certification is made in accordance with the requirements of the Federal Coastal Zone Management Act (16 U.S.C. 1451 et seq.) (CZMA) and implementing regulations at 15 CFR Part 930, as amended, and pursuant to 301 CMR 21.00 and relevant statutory and regulatory authorities for the Commonwealth of Massachusetts Coastal Zone Management Plan and Program Policies. The analysis contained herein describes Project compliance with each of the Massachusetts Coastal Zone Management Plan enforceable policies.

6.8.1 Jurisdiction for Federal Consistency Certification

According to the coastal zone boundary defined by the Coastal Zone Management Program Federal Consistency Review Procedures regulations at 301 CMR 21.99, the Project site lies entirely within the coastal zone. Although the Project as currently proposed does not require any federal actions that are subject to the CZM federal consistency requirement, Project consistency with CZM's enforceable policies is nonetheless discussed herein. Applicable review procedures are set forth at 301 CMR 21.07 (see 301 CMR 21.04(2)).

The following section describes the Project's consistency with the program policies of the Massachusetts approved Coastal Zone Management Program Plan as set forth in the policy appendix at 301 CMR 21.98.

6.8.2 Certification of Consistency with MCZM Program Policies

The Proponent certifies that the proposed activity complies with the enforceable policies of the Massachusetts approved Coastal Zone Management Plan (the Plan) and will be conducted in a manner consistent with such policies.

The following sections list each of the Program Policies and Management Principles contained in the Plan and describe how the Project is consistent with the Plan.

6.8.2.1 Water Quality

Water Quality Policy #1

Ensure that point-source discharges in or affecting the coastal zone are consistent with federally-approved state effluent limitations and water quality standards.

The Project will not result in any new point-source discharges; therefore, this policy is not applicable.

Water Quality Policy #2

Ensure that non-point source pollution controls promote the attainment of state surface water quality standards in the coastal zone.

The Project design includes stormwater management measures and techniques that will significant improve the quality of stormwater runoff from the site relative to existing conditions. Section 9.3 contains a detailed discussion of proposed stormwater management.

Water Quality Policy #3

Ensure that activities in or affecting the coastal zone conform to applicable state and federal requirements governing subsurface waste discharges and sources of air and water pollution and protection of wetlands.

The Project does not involve any subsurface waste discharges; therefore, this policy is not applicable. Please see Section 6.5 for a discussion of air quality, Section 9.3 for a discussion of water quality in the context of stormwater management, and Section 6.9 for a discussion related to wetlands protection.

6.8.2.2 Habitat

Habitat Policy #1

Protect wetland areas including salt marshes, shellfish beds, dunes, beaches, barrier beaches, salt ponds, eelgrass beds, and freshwater wetlands for their role as natural habitats.

No coastal wetland resource areas are present on the Project site, and the Project will have no impact to those resources. On-site activities will occur within Bordering Land Subject to Flooding (BLSF) and the 25-foot Riverfront Area (RFA) associated with Sales Creek, but there will be no direct wetlands impacts; no work is proposed in Bordering Vegetated Wetlands (BVW). Compliance with the performance standards of the WPA is presented in Section 6.9.1.3.

Off-site roadway improvements will entail work in Land Subject to Coastal Storm Flowage (LSCSF) and RFAs associated with Sales Creek and Mill Creek. The WPA does not prescribe any specific performance standards for work in LSCSF. Work in RFAs associated with the off-site roadway improvements will occur within the footprint of existing roadways or in maintained lawn, and therefore qualifies as a redevelopment project. Improvements at these locations will include enhancing and restoring degraded areas with native plantings to improve the capacity of the RFA to protect interests of the WPA. Depending on the outcome of MassDOT review, off-site improvements along Lee Burbank Highway may entail minor alteration of Coastal Bank and Salt Marsh. As described in Section 6.9.2, these alterations qualify as limited projects.

Habitat Policy #2

Promote the restoration of degraded or former wetland resources in coastal areas and ensure that activities in coastal areas do not further wetland degradation but instead take advantage of opportunities to engage in wetland restoration.

The Project will not degrade any wetland areas; rather, since the Project includes a stormwater management system, it will significantly improve the quality of stormwater runoff from the site relative to existing conditions, thus benefitting Sales Creek and downstream areas. The off-site roadway improvements will include using native plantings to enhance and restore RFAs that are presently covered by lawn. If the off-site roadway improvements along Lee Burbank Highway result in alteration of Salt Marsh, the Proponent will consult with resource agencies regarding appropriate mitigation. The EEA's Division of Ecological Restoration has several ongoing and future restoration projects in the Belle Isle Marsh area that the Proponent could support if compensation for Salt Marsh alteration is needed.

6.8.2.3 Protected Areas

Protected Areas Policy #1

Assure preservation, restoration, and enhancement of complexes of coastal resources of regional or statewide significance through the Areas of Critical Environmental Concern (ACEC) program.

Sales Creek, which crosses through the site, is associated with the Belle Isle Inlet that is within the Rumney Marshes ACEC. The boundary for this ACEC extends through the Project site from approximately its northwest corner, passing between the proposed Project development and the existing horse barns, through the northern portion of the racetrack infield, and continues east of the Project site. Since stormwater from the Project site discharges into Sales Creek, the stormwater management system proposed as part of the Project will significantly improve the stormwater quality entering the ACEC.

The off-site roadway improvements at the intersection of Winthrop Avenue/Revere Beach Parkway and Tomasello Drive will occur within the above-referenced ACEC. As identified in Section 6.8.2.2, these activities will occur within the footprint of existing roadways and in areas that consist of maintained lawn. Improvements will include enhancing and restoring adjacent disturbed areas with native plantings, thereby improving habitat values associated with the Sales Creek corridor.

Protected Areas Policy #2

Protect state and locally designated scenic rivers and state-classified scenic rivers in the coastal zone.

The Project is not located in or near any state or locally designated scenic rivers; therefore, this policy does not apply.

Protected Areas Policy #3

Review proposed developments in or near designated or registered historic districts or sites to ensure that the preservation intent is respected by federal, state, and private activities and that potential adverse effects are minimized.

The Project site does encompass a few historic resources that are included in the Inventory of Historic and Archaeological Assets of the Commonwealth. In addition, there are a number of historic resources in the vicinity of the Project site, including Revere Beach Parkway, which is listed in the National Register of Historic Places. The Project design avoids and minimizes potential adverse effects to these historic resources, as described in Section 8.0.

6.8.2.4 Coastal Hazards

Coastal Hazard Policy #1

Preserve, protect, restore, and enhance the beneficial functions of storm damage prevention and flood control provided by natural coastal landforms, such as dunes, beaches, barrier beaches, coastal banks, land subject to coastal storm flowage, salt marshes, and land under the ocean.

The Project site does not contain any of these coastal wetland resource areas. Some of the transportation improvements proposed off-site will occur within LSCSF, salt marsh, and coastal bank, but will not adversely affect the ability of these resource areas to provide storm damage prevention or flood control because the improvements will be designed in accordance with applicable AASHTO/MassDOT structural requirements and the affected coastal banks will be reconstructed to preexisting conditions.

Coastal Hazard Policy #2

Ensure construction in water bodies and contiguous land areas will minimize interference with water circulation and sediment transport. Approve permits for flood or erosion control projects only when it has been determined that there will be no significant adverse effects on the project site or adjacent or down coast areas.

The Project does not involve any in-water construction nor is it a flood or erosion control project; therefore, this policy does not apply. Nonetheless, it is relevant to note that erosion and sedimentation control measures will be used during construction, and these are described in the Draft CMP in Attachment L.

Coastal Hazard Policy #3

Ensure that state and federally funded public works projects proposed for location within the coastal zone will: (1) not exacerbate existing hazards or damage natural buffers or other natural resources; (2) be reasonably safe from flood and erosion related damage; (3) not promote growth and development in hazard-prone or buffer areas, especially in Velocity zones and ACECs; and (4) not be used on Coastal Barrier Resource Units for new or substantial reconstruction of structures in a manner inconsistent with the Coastal Barrier Resource/Improvements Acts.

This Project is not a state or federally funded public works project; therefore, this policy does not apply.

Coastal Hazard Policy #4

Prioritize public funds for acquisition of hazardous coastal areas for conservation or recreation use, and relocation of structures out of coastal high hazard areas, giving due consideration to the effects of coastal hazards at the location to the use and manageability of the area.

The Project does not involve the use of public funds; therefore, this policy does not apply.

6.8.2.5 Port and Harbor Infrastructure

Ports Policy #1

Ensure that dredging and disposal of dredged material minimize adverse effects on water quality, physical processes, marine productivity and public health.

The Project does not involve dredging; therefore, this policy does not apply.

Ports Policy #2

Promote the widest possible public benefit from channel dredging, ensuring that designated ports and developer harbors are given highest priority in the allocation of federal and state dredging funds. Ensure that this dredging is consistent with marine environment policies.

The Project does not involve dredging; therefore, this policy does not apply.

Ports Policy #3

Preserve and enhance the capacity of Designated Port Areas (DPAs) to accommodate water-dependent industrial uses and prevent the exclusion of such uses from tidelands and any other DPA lands over which a state agency exerts control by virtue of ownership, regulatory authority, or other legal jurisdiction.

The Project is not located in a DPA; therefore, this policy does not apply.

Ports Management Principle #1

Encourage, through technical and financial assistance, expansion of water dependent uses in designated ports and developed harbors, re-development of urban waterfronts, and expansion of visual access.

The Project is not located in a designated port, developed harbor, or urban waterfront; therefore, this principle does not apply.

6.8.2.6 Public Access

Public Access Management Principle #1

Improve public access to coastal recreation facilities and alleviate auto traffic and parking problems through improvements in public transportation. Link existing coastal recreation sites to each other or to nearby coastal inland facilities via trails for bicyclists, hikers, and equestrians, and via rivers for boaters.

The Proponent has agreed to provide on-street bicycle accommodations to connect Constitution Beach with Belle Isle Marsh and Revere Beach along the Bennington Street corridor, along with connections to and through the Project site from the Suffolk Downs MBTA station and from Winthrop Avenue. This network will effectively create pedestrian and bicycle loop systems that will enhance public access to open space and will improve access to a walkway in the Belle Isle Marsh that is being constructed as part of a separate project associated with a U.S. EPA consent order in accordance with a plan developed by the Friends of Belle Isle Marsh. In addition, the Proponent has agreed to host two Hubway bicycle stations, one near the Suffolk Downs MBTA Station and one near the south entry to Casino Areas I and II, when the system expands into East Boston.

Public Access Management Principle #2

Increase capacity of existing recreation areas by facilitating multiple uses and by improving management, maintenance and public support facilities. Resolve conflicting uses whenever possible through improved management rather than through exclusion of uses.

Although the Project site does not contain any existing recreation areas, the Proponent has agreed to provide on-street bicycle accommodations to connect Constitution Beach with Belle Isle Marsh and Revere Beach along the Bennington Street corridor, along with connections to and through the Project site from the Suffolk Downs MBTA station and from Winthrop Avenue. This network will effectively create pedestrian and bicycle loop systems that will enhance public access to open space and will improve access to a walkway in the Belle Isle Marsh that is being constructed as part of a separate project associated with a U.S. EPA consent order in accordance with a plan developed by the Friends of Belle Isle Marsh. In addition, the Proponent has agreed to host two Hubway bicycle stations, one near the Suffolk Downs MBTA Station and one near the south entry to Casino Areas I and II, when the system expands into East Boston.

Public Access Management Principle #3

Provide technical assistance to developers of private recreational facilities and sites that increase public access to the shoreline.

The Project does not involve a private recreational facility; therefore, this principle does not apply.

Public Access Management Principle #4

Expand existing recreation facilities and acquire and develop new public areas for coastal recreational activities. Give highest priority to expansions or new acquisitions in regions of high need or limited site availability. Assure that both transportation access and the recreational facilities are compatible with social and environmental characteristics of surrounding communities.

The Proponent has agreed to provide on-street bicycle accommodations to connect Constitution Beach with Belle Isle Marsh and Revere Beach along the Bennington Street corridor, along with connections to and through the Project site from the Suffolk Downs MBTA station and from Winthrop Avenue. This network will effectively create pedestrian and bicycle loop systems that will enhance public access to open space and will improve access to a walkway in the Belle Isle Marsh that is being constructed as part of a separate project associated with a U.S. EPA consent order in accordance with a plan developed by the Friends of Belle Isle Marsh. In addition, the Proponent has agreed to host two Hubway bicycle stations, one near the Suffolk Downs MBTA Station and one near the south entry to Casino Areas I and II, when the system expands into East Boston.

6.8.2.7 Energy

Energy Policy #1

For coastally dependent energy facilities, consider siting in alternative coastal locations. For non-coastally dependent energy facilities, consider siting in areas outside of the coastal zone. Weigh the environmental and safety impacts of locating proposed energy facilities at alternative sites.

The Project does not involve an energy facility; therefore, this policy does not apply.

Energy Management Principle #1

Encourage energy conservation and the use of alternative sources such as solar and wind power in order to assist in meeting the energy needs of the Commonwealth.

Energy conservation measures have been incorporated into the Project design, as described in Section 9.5. Although the Project site is not suitable for wind power, a PV array is included in the Project design.

6.8.2.8 Ocean Resources

Ocean Resources Policy #1

Support the development of environmentally sustainable aquaculture, both for commercial and enhancement (public shellfish stocking) purposes. Ensure that the review process regulating aquaculture facility sites (and access routes to those areas) protects ecologically significant resources (salt marshes, dunes, beaches, barrier beaches, and salt ponds) and minimizes adverse impacts upon the coastal and marine environment.

The Project does not involve aquaculture; therefore, this policy does not apply.

Ocean Resources Policy #2

Extraction of marine minerals will be considered in areas of state jurisdiction, except where prohibited by the Massachusetts Ocean Sanctuaries Act, where and when the protection of fisheries, air and marine water quality, marine resources, navigation and recreation can be assured.

The Project does not involve extraction of marine minerals; therefore, this policy does not apply.

Ocean Resources Policy #3

Accommodate offshore sand and gravel mining needs in areas and in ways that will not adversely affect shoreline areas due to alteration of wave direction and dynamics, marine resources and navigation. Mining of sand and gravel, when and where permitted, will be primarily for the purpose of beach nourishment.

The Project does not involve offshore mining or beach nourishment; therefore, this policy does not apply.

6.8.2.9 Growth Management

Growth Management Principle #1

Encourage, through technical assistance and review of publicly funded development, compatibility of proposed development with local community character and scenic resources.

The Project is not a publicly-funded development; therefore, this principle does not apply.

Growth Management Principle #2

Ensure that state and federally funded transportation and wastewater projects primarily serve existing developed areas, assigning highest priority to projects that meet the needs of urban and community development centers.

This Project is not a state or federally funded transportation or wastewater project; therefore, this principle does not apply.

Growth Management Principle #3

Encourage the revitalization and enhancement of existing development centers in the coastal zone through technical assistance and federal and state financial support for residential, commercial and industrial development.

This Project involves the redevelopment of an under-utilized site into a world-class destination resort that will also maintain and enhance the Suffolk Downs racetrack operations. It will have numerous economic benefits for the area without requiring federal or state financial support.

6.8.3 Conclusion

As described herein, the Project complies with the enforceable policies of the Massachusetts approved Coastal Zone Management Plan and will be conducted in a manner consistent with such policies.

6.9 Wetlands

6.9.1 Description of On-Site Wetland Resource Areas

On April 24 through 26 and May 3, 2012, wetland and soil scientists from Epsilon Associates, Inc. (Epsilon) delineated wetlands and other resource areas[15] within the approximately 161-acre Project site. The purpose of the delineation was to define the extent of wetlands, resource areas, and buffer zones regulated under the Massachusetts WPA (MGL Ch. 131 § 40), Sections 401/404 of the U.S. Clean Water Act (CWA, 33 U.S.C. 1344), and local wetland ordinances in the Cities of Revere and Boston.[16] Delineated wetland resource areas on the Project site are shown on Figure 6-33.

---

[15] "Resource Area," as used herein, means any of the areas specified in the Massachusetts Wetlands Protection Act regulations at 310 CMR 10.25 through 10.35 and 310 CMR 10.54 through 10.58. It is used synonymously with Area Subject to Protection Under M.G.L. c. 131, § 40, each one of which is enumerated in 310 CMR 10.02(1).

[16] The City of Boston does not currently have a Wetlands Protection Ordinance with the exception of a provision for local filing fees.

Table 6-31 summarizes the delineated wetlands and other resource areas and identifies the jurisdictional status of each under the Wetlands Protection Act and Revere Wetlands Protection Ordinance. For the purposes of this evaluation, Epsilon assumed that all delineated vegetated wetlands and streams located on the Project site are jurisdictional "waters of the United States"[17] as defined under Sections 401 and 404 of the U.S. Clean Water Act. The wetland resource areas delineated by Epsilon are located in both Revere and Boston (the municipal boundary bisects the site). Boundaries of the delineated wetland resource areas and associated buffer zones are depicted on Figure 6-33. Additional details pertaining to the wetland delineation work conducted by Epsilon are provided in the technical memo in Attachment I, which includes more detailed graphics, wetland determination field forms, representative site photographs, and information describing the 1999 Densely Developed Area (DDA) designation relative to the Sales Creek Riverfront Area.

In general, wetland resource areas identified on or immediately adjacent to the Project site include BVW, RFA associated with Sales Creek, Inland Bank and Land Under Water (LUW) associated with Sales Creek, on-site intermittent streams, and a pond located in the center of the racetrack infield. No Isolated Land Subject to Flooding is delineated.

The RFA associated with Sales Creek is the area of land between a river's mean annual high-water line measured horizontally outward from the river and a parallel line located 200 feet away, except that the parallel line is located 25 feet away in Boston and 25 feet away in DDAs, as designated by the Secretary of EEA pursuant to 301 CMR 10.00 (see 310 CMR 10.58(2)(a)3). On March 12, 1999, Sales Creek and the surrounding environs on the Project site were designated as a DDA by the Secretary; accordingly, the RFA is also 25 feet in the City of Revere. RFA does not have a buffer zone.

An ACEC is an area designated by the EEA Secretary in accordance with 301 CMR 12.00 of CZM regulations. Sales Creek is associated with the Belle Isle Inlet, which is within the Rumney Marshes ACEC. The ACEC extends through the Project site from approximately its northwest corner, passing between the proposed Project development and the existing horse barns, through the northern portion of the racetrack infield, and continues east of the Project site (see Figure 5 in Attachment I).

Portions of the Project site are located within the 100-year floodplain as delineated by the FEMA (see Figure 2 in Attachment I), and the floodplain has been conservatively classified as BLSF based on two open Orders of Conditions issued by the Boston and Revere Conservation Commissions in 2011 (MassDEP File Nos. 006-1276 and 061-0620).

[17] "Waters of the United States" is broadly defined in the federal regulations that implement the Clean Water Act. It includes tidal waters, rivers, streams, lakes, ponds and wetlands.

According to the applicable FEMA FIRM panel numbers 25025C0038G and 252025C0019G, portions of the Suffolk Downs property are located within a mapped 100-year floodplain, Zone AE, Base Elevation 9 feet NGVD (15.46 feet Boston City Base).

The Proponent reviewed the Massachusetts Natural Heritage Atlas (MassGIS, 2008), prepared by the Massachusetts Natural Heritage and Endangered Species Program (NHESP), for state-listed species on or near the Project site. The Project site does not contain any areas of Priority Habitat or Estimated Habitat for state-listed species. There are also no mapped certified or potentially certifiable vernal pools located on or near the Project site.

Table 6-31 Summary of Jurisdictional Wetland Resource Areas under the Wetlands Protection Act and Revere Wetlands Ordinance

Wetland Flag Series	*Wetland Resource Areas in Flag Series*				*Comments*
	Inland Bank	LUW	BVW	RFA	
A			•		Flag Series A delineates a detention basin that connects directly to Sales Creek (Series F/FF) via a culvert under Furlong Drive (thus making it a BVW). Series A and Flag Series B/BB are connected via a flood control gate running under an upland berm. This wetland series has a 100 foot buffer zone and is located in the City of Revere.
B/BB	•	•	•		Series B/BB delineates the edge of a linear BVW that borders an intermittent stream. The Inland Bank of the stream was not formally delineated because it exists down gradient of the BVW and is non-descript in certain stretches. This series is connected under Route 1A via a culvert. This wetland series has a 100 foot buffer zone and is located in the City of Revere and the City of Boston.
C	Non Jurisdictional Stormwater Basin				This non-jurisdictional stormwater basin is depicted as an open water body with no wetland flags shown on the referenced existing conditions plan. The vegetation is predominantly common reed *(Phragmites australis)*. The stormwater basin is located in the City of Revere. This stormwater basin does not meet the criteria to be regulated as a wetland resource area including but not limited to "ponds" and "streams" (see 310 CMR 10.04) comprised of Inland Bank (310 CMR 10.54) and Land Under Water (310 CMR 10.56) or Isolated Land Subject to Flooding (310 CMR 10.57) and BVW (310 CMR 10.55). It is also Epsilon's opinion that the Corps would not likely regulate this area as a water of the U.S.
D	Non Jurisdictional Stormwater Basin				This non-jurisdictional stormwater basin is depicted as an open water body with no wetland flags shown on the enclosed existing conditions plan. The vegetation is predominantly common reed. The stormwater basin is located in the City of Revere. Similar to Series C described above, this stormwater basin does not meet the criteria to be regulated as a wetland resource area including but not limited to "ponds" and "streams" (see 310 CMR 10.04) comprised of Inland Bank (310 CMR 10.54) and Land Under Water (310 CMR 10.56) or Isolated Land Subject to Flooding (310 CMR 10.57) and BVW (310 CMR 10.55). It is also Epsilon's opinion that the Corps would not likely regulate this area as a water of the U.S.
E			•		Flag Series E delineates a small pocket BVW/stormwater feature that is connected to Flag Series F/FF (Sales Creek) via three culverts. This wetland series has a 100 foot buffer zone and is located in the City of Revere.
F/FF	•	•	•	•	Flag Series F/FF delineates BVW and the ordinary high water mark (OHWM) of Sales Creek (the lines are generally coincident). The 25-foot RFA extends from OHWM. Inland Bank and LUW were not formally delineated but exist down-gradient of the flag series. This wetland series has a 100-foot buffer zone from the BVW edge; RFA does not have a buffer zone. It is located in the City of Revere.
G/GG			•		Flag Series G/GG delineates a pocket BVW/stormwater feature connected via a culvert to Flag Series F/FF; it has a 100-foot buffer zone and is located in the City of Revere.

Wetland Flag Series	*Wetland Resource Areas in Flag Series*				*Comments*
	Inland Bank	LUW	BVW	RFA	
H	•	•	•		Flag Series H/HH delineates a Bank and BVW that borders an intermittent stream (drainage ditch); these resource areas are generally coincident throughout. LUW was not formally delineated but it exists down-gradient of the flag series. The higher elevation culvert inlet near Route 1A receives drainage from adjacent roads, as does the culvert outlet. Wetland Series H has a 100-foot buffer zone and is located in the City of Boston.
I/II	•	•		•	Flag Series I/II delineates Inland Bank and Sales Creek OHWM where it flows aboveground in the study area. The 25-foot RFA extends from OHWM. This wetland series has a 100-foot buffer zone from the Bank; RFA does not have a buffer zone. It is located in Revere.
J/JJ	•	•		•	Flag Series J/JJ delineates Inland Bank and Sales Creek OHWM where it flows aboveground in the study area. The 25-foot RFA extends from OHWM. This wetland series has a 100-foot buffer zone from Bank; RFA does not have a buffer zone. It is located in the City of Revere.
K/KK	•	•	•		Flag Series K/KK delineates BVW that borders an intermittent stream comprised of Inland Bank and LUW. Select portions of this series also delineate Sales Creek OHWM and its associated 25-foot RFA. This wetland series has a 100-foot buffer zone from BVW; RFA does not have a buffer zone. It is located in the City of Revere and the City of Boston.
L/LL	•	•	•		Flag Series L/LL delineates BVW that borders an intermittent stream comprised of Inland Bank and LUW. Select portions of this series also delineate Sales Creek OHWM and its associated 25-foot RFA. This wetland series has a 100-foot buffer zone from BVW; RFA does not have a buffer zone. It is located in the City of Revere.
Pond in Infield & Up-gradient Drainage Ditch	•	•			The open water body located in the center of the racetrack infield appears to meet the definition of a "pond" as defined under 310 CMR 10.04.[18] The pond is comprised of Inland Bank and LUW; no discernible BVW is present. There is a 100-foot buffer zone that extends from the edge of the pond (it was not formally delineated in the field because its boundary is so well defined). The pond is located in the City of Boston. The man-made drainage ditch up-gradient of the pond was not classified as a jurisdictional wetland resource area. According to 310 CMR 10.04, such a body of running water which does not flow throughout the year (i.e., which is intermittent) is a stream <u>except</u> for that portion up-gradient of all bogs, swamps, wet meadows, and marshes.

[18] According to 310 CMR 10.04, "pond" means any open body of fresh water with a surface area observed or recorded within the last ten years of at least 10,000 square feet. Ponds may be either naturally occurring or man-made by impoundment, excavation, or otherwise. Ponds shall contain standing water except for periods of extended drought. Periods of extended drought for purposes of 310 CMR 10.00 shall be those periods, in those specifically identified geographic locations, determined to be at the "Advisory" or more severe drought level by the Massachusetts Drought Management Task Force, as established by the Executive Office of Environmental Affairs and the Massachusetts Emergency Management Agency in 2001, in accordance with the Massachusetts Drought Management Plan (MDMP). Notwithstanding the above, the following man-made bodies of open water shall not be considered ponds: (a) basins or lagoons which are part of wastewater treatment plants; (b) swimming pools or other impervious man-made basins; and (c) individual gravel pits

6.9.1.1 Significance of On-Site Wetland Resource Areas Under the Wetlands Protection Act

The WPA recognizes eight interests (i.e., functions and values) of wetland resource areas, which are identified in 310 CMR 10.01. Interests of the Act may be grouped into three general categories: water quality, water supply protection and pollution prevention; storm damage prevention and flood control; and wildlife habitat and fisheries protection. Each of the presumed WPA interests is identified in Table 6-32 relative to the wetland resource areas delineated on the Project site.

From a pure functions and values perspective, BVWs on the Project site are generally degraded given their context within a heavily developed urban environment. These BVWs are comprised primarily of invasive herbaceous and woody plant species including but not limited to common reed *(Phragmites australis),* multiflora rose *(Rosa multiflora),* buckthorn *(Frangula alnus),* and purple loosestrife *(Lythrum salicaria).* Non-invasive species include but are not limited to sweetgale *(Myrica gale)* and various sedges, rushes, and grasses. The primary functions of the BVWs appear to be flood control, storm damage prevention, and pollution attenuation.

Similarly, a portion of the RFA associated with Sales Creek is previously developed and degraded as defined by the WPA regulations. A significant area of BLSF on and adjacent to the Project site primarily overlays previously developed areas comprised of pavement and fill material.

Table 6-32 Significance of On-Site Wetland Resource Areas Under the WPA

Protected Interests of the Act	*Wetland Resource Areas within Study Area*				
	BVW	*Inland Bank*	*Land Under Water*	*RFA*	*BLSF*

Protection of Fisheries	•	•	•	•	
Protection of Wildlife Habitat	•	•	•	•	•

6.9.1.2 Activities Proposed in On-Site Wetland Resource Areas

A portion of on-site activities will occur within BLSF and the 25-foot RFA associated with Sales Creek. Activities proposed in BLSF and RFA are shown on Figure 6-34 and quantified in Table 6-33. No work is proposed in BVW, Inland Bank, or LUW.

Table 6-33 On-Site Wetland Resource Area Impacts

Wetland Resource Areas	*Approximate Impacts*	*Description of Activities*
BLSF	615,000 sf/ 14 acres	These alterations are associated with cutting and filling activities to properly grade the site, including a part of the existing stable area, the parking lot south of Sales Creek and north of the proposed building, and areas located along Tomasello Drive to accommodate construction of the new roadway. The work will occur in previously developed areas comprised of pavement or urban fill. Cutting and filling activities will result in a net increase of approximately 60,000 cubic feet of floodplain storage capacity (see Section 2.3.5 for a detailed discussion of floodplain activities). The enhanced floodplain storage areas will be designed to comply with WPA performance standards for BLSF (310 CMR 10.57). The locations of these areas are shown on Figures 2-1 and Figure 6-34.
25-foot RFA (Sales Creek)	Approximately 7,000 SF/0.16 acres	Activities in the 25-foot RFA are limited to proposed stormwater management system improvements including installation of flared end structures and riprap erosion controls and the construction of floodplain compensation areas. A portion of the RFA in this location has been previously developed and degraded as defined under 310 CMR 10.58(5). The proposed upgrades to the stormwater management system will also be designed to comply with MassDEP stormwater standards and should substantially improve water quality following construction.
BVW	0	No work is proposed in BVW. Erosion controls will be installed along the limit of work line in these locations to protect the BVW.
Inland Bank	0	No work is proposed on Inland Bank associated with on-site intermittent streams (drainage ditches) or Sales Creek. Erosion controls will be installed along the limit of work line in these locations to protect the resource areas.
LUW	0	No work is proposed on LUW associated with on-site intermittent streams (drainage ditches) or Sales Creek. Erosion controls will be installed along the limit of work line in these locations to protect the resource areas.

Activities proposed in BLSF will occur primarily in three locations: (1) in a part of the existing stable area north of Sales Creek in Revere; (2) in the parking lot located south of Sales Creek and north of the proposed casino and hotel buildings; and (3) along Tomasello Drive to accommodate construction of the new roadway. These activities will involve grading, which will consist of both cutting and filling activities. There will also be some grading associated with the installation and construction of utilities and stormwater management system components. All work will occur in previously developed areas comprised of pavement or urban fill. Pursuant to the WPA regulations (310 CMR 10.57), the filling of BLSF requires compensatory flood storage to prevent an increase in the horizontal extent and level of flood waters during peak flows. Although the Project will fill some areas of BLSF, the site design calls for more cutting than filling, and these activities will result in a net *increase* in approximately 60,000 cubic feet of floodplain storage (see

Section 2.3.5). The additional flood storage areas will be designed to comply with WPA performance standards for BLSF (see Section 2.3 for additional detail). The locations of proposed floodplain storage areas are shown on Figures 2-1 and 6-34.

With regard to the Sales Creek RFA, activities in this location are limited to proposed stormwater management system improvements and upgrades and construction of a small floodplain compensatory storage area adjacent to Sales Creek at the north end of the site. A portion of the RFA is previously developed and degraded as defined under 310 CMR 10.58(5). Proposed upgrades to the stormwater management system, including any new or modified discharges, will be appropriately set back from Sales Creek and will comply with MassDEP stormwater standards. No work will occur on or below the Inland Bank of Sales Creek or its adjoining BVW. Proposed upgrades to the stormwater management system should substantially improve the quality of stormwater discharged to Sales Creek relative to existing conditions. In addition, the proposed development will decrease impervious area on the site by approximately 14 acres, thereby reducing the rate and volume of stormwater leaving the site. The Proponent evaluated a number of alternatives to reduce impervious surfaces, including but not limited to reduced parking ratios, consolidated parking areas, building footprints, and the incorporation of green space and landscaping into the overall design. Sustainable site design measures are described in Section 2.0, and proposed stormwater management is described in Section 9.3.

Activities in the 100-foot buffer zone to BVW and Inland Bank include construction of the proposed entrance drive and parking areas, utility connections, and upgrades to the stormwater management system, including construction of LID bioretention basins. These activities will occur in previously developed areas of the buffer zone comprised of impervious surfaces or urban fill. No work is proposed in BVW or Inland Bank. Sedimentation and erosion controls will be installed along the limit of work line in these locations to protect the adjacent resource areas.

6.9.1.3 Compliance with Wetlands Protection Act General Performance Standards for On-Site Activities

In accordance with 310 CMR 10.03(1)(2), activities proposed within RFA and BLSF will contribute to the protection of interests identified in the WPA by complying with the general performance standards established for each area. Additional information is provided below.

Bordering Land Subject to Flooding

310 CMR 10.57(4)(a)(1) - Compensatory storage shall be provided for all flood storage volume that will be lost as the result of a proposed project within Bordering Land Subject to Flooding, when in the judgment of the issuing authority said loss will cause an increase or will contribute incrementally to an increase in the horizontal extent and level of flood waters during peak flows.

The Project will not result in the loss of any flood storage volume within BLSF on the Project site. On the contrary, proposed grading activities will result in a net *increase* of approximately 60,000 cubic feet of floodplain storage capacity (see Figure 6-34). Table 6-34 demonstrates that compensatory flood storage will be provided for all flood storage volume that will be permanently lost as a result of the Project. The volume will be created in areas not previously used for flood storage and will be incrementally equal to or greater than the theoretical volume of flood water lost at each elevation, up to and including the 100-year flood elevation, which will be displaced by the Project.

Table 6-34 Cut and fill impacts in existing 100-year floodplain along Tomasello Drive.

Elevation (feet)	*Fill (cubic feet)*	*Cut (cubic feet)*	*Net (cubic feet)*
Along Tomasello Drive			
14-15	3000	-9000	-6000
15-15.5	10000	-12000	-2000
total	*13000*	*-21000*	*-8000 (compensatory storage)*
North Parking Lot/CAFO Parking Lot			
11-12	800	-1000	-200
12-13	7000	-10000	-3000
13-14	20000	-27000	-7000
14-15	33000	-58000	-25000
15-15.5	19000	-36000	-17000
total	*79800*	*-132000*	*-52200 (compensatory storage)*
Total Site			
11-12	800	-1000	-200
12-13	7000	-10000	-3000
13-14	20000	-27000	-7000
14-15	36000	-67000	-31000
15-15.5	29000	-48000	-19000
total	*92800*	*-156000*	*-60200 (compensatory storage)*

310 CMR 10.57(4)(a)(2) - Work within Bordering Land Subject to Flooding, including that work required to provide the above-specified compensatory storage, shall not restrict flows so as to cause an increase in flood stage or velocity.

As depicted on Figure 6-34, the proposed compensatory flood storage areas have been designed and sited so as not to restrict flows that in turn could potentially cause an increase in flood stage or velocity.

310 CMR 10.57(4)(a)(3) - Work in those portions of bordering land subject to flooding found to be significant to the protection of wildlife habitat shall not impair its capacity to provide important wildlife habitat functions. Except for work which would adversely affect vernal pool habitat, a project or projects on a single lot, for which Notice(s) of Intent is filed

on or after November 1, 1987, that (cumulatively) alter(s) up to 10% or 5,000 square feet (whichever is less) of land in this resource area found to be significant to the protection of wildlife habitat, shall not be deemed to impair its capacity to provide important wildlife habitat functions. Additional alterations beyond the above threshold, or altering vernal pool habitat, may be permitted if they will have no adverse effects on wildlife habitat, as determined by procedures contained in 310 CMR 10.60.

According to 310 CMR 10.57(1)(a)3, certain portions of BLSF may be treated as potentially significant to the protection of wildlife habitat. These include areas on the "lower floodplain" which is comprised of the ten-year floodplain or the portion of BLSF that is located within 100 feet of the Bank or BVW (whichever is farther from the waterbody or waterway, as long as such area is contained within the 100-year floodplain), and all vernal pool habitat on the 100-year floodplain.

Approximately 106,000 square feet of lower floodplain on the Project site will be altered, but proposed impacts are confined to areas extensively altered by human activity (e.g., paved surfaces, urban fill) adjacent to existing previously-developed areas and major roadways, thus resulting in no impacts to wildlife habitat.

There are no mapped certified or potentially certifiable vernal pools located on or near the Project site.

Riverfront Area

The Sales Creek RFA is 25 feet wide in the cities of Revere and Boston. Sales Creek is surrounded on all sides by impervious surfaces from existing parking lots, horse stables, and related maintenance facilities. A narrow band of woody and herbaceous vegetation exists along the side slopes of Sales Creek and includes small saplings, shrubs, and pockets of common reed.

Activities proposed in the Sales Creek RFA include stormwater management system improvements including installation of flared-end structures and riprap erosion control that will discharge from the closed drainage system to Sales Creek and construction of a small floodplain compensation area. Proposed upgrades to the stormwater management system, including any new or modified discharges, will be set back from Sales Creek and will comply with MassDEP stormwater standards. No work will occur on or below the Inland Bank of Sales Creek or its adjoining BVW. Proposed upgrades to the stormwater management system should substantially improve the quality of discharged water relative to existing conditions.

While a portion of the RFA where work is proposed can arguably be classified as "previously developed and degraded" as defined under 310 CMR 10.58(5), the Project has nonetheless been designed to comply with the General Performance Standards for undeveloped RFA as follows.

310 CMR 10.58(4)(a) - Protection of Other Resource Areas. The work shall meet the performance standards for all resource areas within the riverfront area, as defined in 310 CMR 10.30 (coastal bank), 10.32 (salt marsh), 10.55 (Bordering Vegetated Wetland), and 10.57 (Land Subject to Flooding). When work in the riverfront area is also within the buffer zone to another resource area, the performance standards for the riverfront area, shall contribute to the protection of the interests of MGL c. 131, §40 in lieu of any additional requirements that might otherwise be imposed in the buffer zone within the riverfront area.

Activities proposed in the RFA do not involve alterations to Bank, LUW, or BVW. These resource areas will be protected during construction by sedimentation and erosion controls and a clear limit of work setback. Activities proposed in BLSF have been designed to conform to the relevant performance standards as demonstrated herein.

310 CMR 10.58(4)(b) - Protection of Rare Species. No project may be permitted within riverfront area which will have any adverse effect on specified habitat sites of rare wetland or upland vertebrate or invertebrate species, as identified by the procedures established under 310 CMR 10.59 or 10.37 or which will have any adverse effect on vernal pool habitat certified prior to the filing of the Notice of Intent.

This standard is not applicable. No portion of the Project site is mapped as rare species habitat by the NHESP.

310 CMR 10.58(4)(c) - Practicable and Substantially Equivalent Economic Alternatives. There must be no practicable and substantially equivalent economic alternative to the proposed project with less adverse effects on the interests identified in M.G.L. c. 131 §40.

Section 1.9 contains an analysis of potential alternatives, including development alternatives, on the Project site. Activities proposed in the RFA have been avoided to the maximum extent practicable and are limited to minor stormwater management system improvements and upgrades, compensatory flood storage and grading associated with the proposed parking lot and access drive. All of the proposed parking areas, buildings, and access drives have been sited outside the RFA. Proposed upgrades to the stormwater management system, including any new or modified discharges, will be set back as far as possible from Sales Creek and will comply with MassDEP stormwater standards. Because of topographic constraints it is not feasible to locate stormwater discharges outside the RFA and still convey treated stormwater runoff to the creek. No work will occur on or below the Inland Bank of Sales Creek. Proposed upgrades to the stormwater management system should substantially improve the quality of discharged water relative to existing conditions.

310 CMR 10.58(4)(d) - No Significant Adverse Impact. The work including proposed mitigation measures must have no significant adverse impact on the riverfront area to protect the interests in M.G.L. c. 131 §40. Within 25 foot riverfront areas, any proposed work shall cause no significant adverse impact by:

a. Limiting alteration to the maximum extent feasible, and at a minimum, preserving or establishing a corridor of undisturbed vegetation of a maximum feasible width. Replication and compensatory storage required to meet other resource area performance standards are allowed within this area; structural stormwater management measures shall be allowed only when there is no practicable alternative;

As demonstrated under 310 CMR 10.58(4)(c) above, alterations to RFA have been limited to the maximum extent feasible with only limited disturbance to existing vegetation. Proposed upgrades to the stormwater management system, including any new or modified discharges, will be set back as far as practicable from Sales Creek and will comply with MassDEP stormwater standards. Because of topographic constraints it is not feasible to locate stormwater discharges outside the RFA. No work will occur on or below the Inland Bank of Sales Creek. Proposed upgrades to the stormwater management system should substantially improve the quality of discharged water relative to existing conditions.

b. Providing stormwater management according to standards established by the Department;

The Project includes a new stormwater management system that should significantly improve existing conditions. In addition, the proposed development will decrease impervious area on the site by approximately 14 acres and will harvest rainwater from building roofs for reuse, thereby reducing the rate and volume of stormwater leaving the site. A combination of conventional and LID drainage BMPs will be included as part of the site's drainage design. These measures will include water quality swales, bioretention basins, catch basins with hoods and sumps, and proprietary structural water quality units. See Section 9.3 for additional information demonstrating compliance with MassDEP stormwater standards.

c. Preserving the capacity of the riverfront area to provide important wildlife habitat functions. Work shall not result in an impairment of the capacity to provide vernal pool habitat when identified by evidence from a competent source but not yet certified; and

The limited amount of work proposed in the 25-foot RFA will not impact the capacity of the RFA to provide important wildlife habitat functions (assuming such functions even exist in the proposed impact area).

d. Proposed work shall not impair groundwater or surface water quality by incorporating erosion and sedimentation controls and other measures to attenuate nonpoint source pollution.

Sedimentation and erosion control devices will be installed along the limit of work to protect Sales Creek during construction. These devices will be routinely inspected and maintained throughout the duration of construction until the work area has been stabilized with vegetation or other means.

6.9.2 Off-Site Wetland Resource Areas

Environmental Scientists from VHB identified wetlands and other resource areas that occur in proximity to potential off-site roadway improvements. The purpose of this effort was to estimate the extent of wetlands, resource areas and buffer zones regulated under the Massachusetts Wetlands Protection Act, Section 401/404 of the U.S. Clean Water Act and local Revere Wetland Ordinance.

Table 6-35 presents a summary of wetlands and other resource areas that have been identified and their corresponding jurisdictional status under the Wetlands Protection Act and Revere Wetlands Protection Ordinance. For the purpose of this evaluation, VHB assumed that all of the vegetated wetlands and streams located in proximity to the off-site improvements are jurisdictional "waters of the US" as defined under Section 401 and 404 of the U.S. CWA. The general location of off-site roadway improvements that are proximal to wetland resources are depicted on Figure 6-35. The approximate limits of the wetland resource areas in each of these areas and estimated impacts are depicted on Figures 6-35 through 6-39.

In general, wetland resources were identified within or immediately adjacent to four areas where off-site roadway improvements are anticipated. These wetland systems (identified as Off-site Wetlands 1 through 4) are located in Boston, Chelsea and/or Revere. Off-site Wetlands 1, 2 and 4 are jurisdictional under the Massachusetts WPA and include LUW, inland Bank, BVW, RFA, Salt Marsh, and/or Coastal Bank. Off-site Wetland (OSW) 3 consists of a scrub-shrub swamp that occupies an isolated depression. This wetland does not appear to be regulated under the WPA (because it does not border or drain to or from a water body or watercourse and does not confine enough standing water to be regulated as Isolated Land Subject to Flooding) but is assumed to be jurisdictional under the CWA as a water of the U.S.

According to FEMA FIRM panels 25025C0017G, 25025C009G and 25025C0038G, OSW 1, 2 and 4 lie within areas subject to flooding (Zone AE) during a 100-year frequency storm event. Based on the configuration of the floodplains depicted on the panels and their proximity to coastal water bodies, these areas are characterized as Land Subject to Coastal Storm Flowage under the WPA.

OSW 2 is part of the Rumney Marshes ACEC. As determined through the review of the Massachusetts Natural Heritage Atlas, the off-site roadway improvements will not occur within any areas of Priority Habitat or Estimated Habitat for state-listed species. There are also no mapped certified or potentially certifiable vernal pools located on or near the off-site roadway improvements.

Table 6-35 Summary of Off-Site Jurisdictional Wetland Resource Areas under the Wetlands Protection Act and Revere Wetlands Ordinance

Wetland Identifier[19]	Inland Bank	Land Under Waterways	Bordering Vegetated Wetland	Riverfront Area	Salt Marsh	Land Subject to Coastal Storm Flowage	Coastal Bank	Federal Wetland	Comments
OSW1					•	•	•	•	Off-site Wetland 1 consists of an approximately 200-square-foot Salt Marsh, which borders a small tidal creek, located between a former railroad bed adjacent to Chelsea Creek and a vertical retaining wall on the west side of Route 1A. Coastal bank occurs along both sides of the marsh and along the retaining wall. Where not composed of the retaining wall, the coastal bank is moderately-sloping (3:1) and is currently stabilized by a mixture of rock armor and dense vegetation. For these reasons, the coastal bank associated with Off-site Wetland 1 functions as a vertical buffer to storm waters. Salt Marsh and coastal bank have a 100-foot buffer zone under the WPA and the Revere Ordinance. Additionally, FEMA mapping of the area indicates that the resource Land Subject to Coastal Storm Flowage (LSCSF) occurs on Route 1A in the vicinity of OS1.
OSW2	•	•	•	•		•		•	Off-site Wetland 2 is a combination of an emergent marsh and open water associated with Sales Creek. This system occurs on both sides of Revere Beach Parkway, immediately southeast of the intersection with North Shore Road. It is located in the Rumney Marshes ACEC. Resource areas associated with OS2 include LUW, Bank, and BVW. Because it is identified as a perennial watercourse, and the area is considered a DDA, there is a 25-foot wide RFA from the mean annual high water line (MAHWL) of Sales Creek. The BVW and Bank (where not bordered by wetlands) have an associated 100-foot buffer zone under the WPA and Revere Ordinance. Additionally, FEMA mapping of the area indicates that the resource area LSCSF extends across portions of Revere Beach Parkway that are located southeast of the intersection with North Shore Road.
OSW3								•	Off-site Wetland 3 is an isolated wetland area located at a low point between the Route 16 westbound and eastbound lanes, just north of the intersection with Winthrop Avenue. The wetland does not have a hydrologic connection to other resource areas and therefore is not regulated under the WPA as BVW but may be regulated under the federal Clean Water Act as a water of the U.S.
OSW4	•	•	•	•	•	•	•	•	Off-site Wetland 4 is salt/brackish marsh and tidal creek complex located at the western limit of Mill Creek at the interchange of Revere Beach Parkway (Route 16) and Route 1. Under the WPA and Revere Ordinance, OS4 is regulated as Salt Marsh, Coastal Bank, LUW, inland Bank and BVW. The coastal banks associated with Off-site Wetland 4 are moderately sloping (3:1) and are stabilized with a dense cover of vegetation. Accordingly, they function as a vertical buffer to storm waters. RFA (25-feet wide in Chelsea and 200-feet wide in this section of Revere) extends from the MAHWL of Mill Creek. Under the WPA and Revere Ordinance, a 100-foot buffer zone extends from the limits of Salt Marsh, Coastal Bank, Inland Bank (where not bordered by wetlands) and BVW. Additionally, FEMA mapping of the area indicates that the on/off ramp infields and portions of the roadways are inundated during storm events. These areas are regulated as LSCSF under the WPA and Revere Ordinance.

[19] Off-site wetlands identified were not delineated in the field. Wetland boundaries were interpolated from aerials and available wetland mapping, inspected in the field, and refined as necessary using a GPS with sub-meter accuracy.

6.9.2.1 Roadway Improvements and Potential Wetland Impacts to OSW1

The off-site improvements planned along Route 1A (Gen. William McClellan/Lee Burbank Highway) will occur within and adjacent to resource areas associated with Off-site Wetland 1. As currently proposed, direct impacts to wetland resources associated with the improvements (adding turning lanes by reducing the width of the grassed median) will include approximately 64,000 square feet of work within LSCSF and work within the 100-foot buffer zone to coastal bank.

To achieve full compliance with roadway standards, MassDOT may require full width shoulders which could necessitate relocating the sidewalk along the west side of Route 1A in this area. If so, the off-site roadway improvements will require the alteration of approximately 70 linear feet of Coastal Bank, approximately 200 square feet of work in Salt Marsh and an additional 3,000 square feet of work in LSCSF. As identified in Table 6-35, the coastal bank in this area is stable (a combination of vertical retaining wall and a moderately-sloping landform) that functions as a buffer to storm waters.

These impacts, if required, can be allowed under the limited project provision cited at 310 CMR 10.24(7)(c)(1) of the WPA Regulations, which allows for maintenance and improvement of existing public roadways (including widening less than a single lane and adding shoulders). As required by the limited project provision, the proposed work will not adversely impact habitat of rare vertebrate or invertebrate species. If needed, the Proponent will consult with resource agencies regarding appropriate mitigation for any loss of Salt Marsh resulting from off-site roadway improvements proposed in this area. As the overall configuration of the coastal bank will not change, the work will not reduce the bank's capacity to function as a buffer to storm waters. The WPA regulations do not prescribe any performance standards for work in LSCSF. In compliance with the General Provisions cited in 310 CMR 10.24(1) of the WPA Regulations, erosion/sedimentation controls will implemented and a clear limit of work will be established to ensure that the construction of these improvements does not adversely impact the adjacent Coastal Bank and abutting Salt Marsh.

6.9.2.2 Roadway Improvements and Potential Wetland Impacts of OSW2

Off-site roadway improvements proposed in proximity to Off-site Wetland 2 include reconfiguring a cross walk and constructing a dedicated right hand turning lane from Revere Beach Parkway/Winthrop Avenue to Tomasello Drive. These improvements are expected to entail approximately 2,700 square feet of work in RFA associated with Sales Creek and approximately 35,000 square feet of work in LSCSF. As indicated earlier, work in LSCSF is not governed by any performance standards. The work in RFA can be permitted as a limited project for maintenance and improvement of existing public roadways (including correcting substandard intersections) cited at 310 CMR 10.53(3)(f) and/or as a redevelopment project (improvement of existing roads) as defined under 310 CMR 10.58(5). The reconfigured cross walk and proposed turning lane will be constructed in

portions of the RFA that currently consist of maintained lawn. The improvements will incorporate elements such as stormwater improvements and enhancing and/or restoring areas presently covered by lawn with native plantings to improve upon the capacity of the RFA to protect the interests of the WPA.

Work will also occur in the 100-foot buffer zone to BVW and Inland Bank. Erosion and sedimentation controls will be installed and maintained throughout the work period in order to comply with the requirements cited at 310 CMR 10.53(1).

6.9.2.3 Roadway Improvements and Potential Wetland Impacts of OSW3

The off-site roadway improvements planned at the intersection of Route 16 and Revere Beach Parkway/Winthrop Avenue will occur near but not in Off-site Wetland 3. This isolated wetland is not regulated under the WPA and does not have an associated 100-foot buffer zone.

6.9.2.4 Roadway Improvements and Potential Wetland Impacts of OSW4

Options to improve traffic circulation are being considered at the interchange of Route 1 and Route 16 in Chelsea and Revere. None of these potential off-site roadway improvements will entail work within salt marsh, coastal bank, LUW, inland bank or BVW. Work will occur in up to 220,000 square feet of LSCSF, which is not governed by performance standards. The off-site improvement could also entail the alteration of up to 18,000 square feet of RFA associated with Mill Creek.

All of this work will occur in areas occupied by existing roadways or maintained lawn areas. Accordingly, these improvements can be permitted under the provisions for the redevelopment of previously developed RFA contained in 310 CMR 10.58(5) (improvement of existing roads) of the WPA Regulations. The design of these improvements will incorporate stormwater management features and the restoration/enhancement of degraded areas (by planting native shrub and tree species) to improve upon the ability of the RFA to protect the interests of the WPA.

The off-site roadway improvements planned at this location will entail work within the 100-foot buffer zone to salt marsh, coastal bank, and BVW. In compliance with the General Provisions cited in 310 CMR 10.24(1) and 310 CMR 10.53(1) of the WPA Regulations, erosion and sedimentation controls and the above-described restoration/enhancement measures will be implemented to ensure that the work in buffer zone does not adversely affect the adjacent resource areas.

6.10 Geotechnical Impacts and Groundwater

This section addresses impacts of the below-grade construction activities anticipated for the proposed Project. Site soil and groundwater conditions, earthwork, and anticipated foundation construction methods, which are based on available subsurface information, are

all addressed herein. Below-grade construction will likely involve installation of deep foundation elements including driven piles, drilled piles, pressure-injected footings, utility relocations and installations, and roadway construction. Below-grade space is planned in the areas beneath Casino Area II, Hotel I, and the parking structure.

6.10.1 Subsurface Conditions

Based on the results of a recent test boring program completed at the site and borings previously completed by others, subsurface soil conditions underlying the proposed Project are expected to be characterized by the general soil profile described in Table 6-36.

Table 6-36 General soil profile at the Project site.

Generalized Description	*Approximate Thickness of Layer (ft)*
Fill	4 to 28
Estuarine/Organic Deposits	5 to 56
Marine Deposits	7 to 63
Glacial Deposits	1 to 26
Bedrock (Cambridge Argillite)	Depth to Rock of 50 to 138 ft

6.10.2 Groundwater Conditions

Per the *Geotechnical Investigation, Suffolk Downs, East Boston and Revere, Massachusetts*, report by GEI Consultants, Inc. dated February 12, 2007, historical measurements of observation wells have indicated groundwater levels ranging from 0.5 to 16 feet below site grades, although groundwater was generally observed on the order of 2 to 6 feet below grade (or approximately El 7 to 14 BCB). In recent test pit explorations, groundwater was typically observed at depths of 2.5 to 7 feet below site grades. Haley & Aldrich is currently obtaining groundwater measurements from an observation well on site. Seasonal fluctuations in groundwater levels can be expected.

The Project site is not located in Boston's Groundwater Conservation Overlay District (GCOD), which includes those areas in Boston having wood pile-supported buildings that are potentially susceptible to possible effects from depressed groundwater levels. Thus, the Project is not subject to the requirements of Article 32 of the Boston Zoning Code.

6.10.3 Excavation and Building Foundation Construction

Foundation support requirements for the new structures are currently being developed. The current level of design for building foundations is based on available information:

- The proposed Casino Area II, Hotel I, and parking garage structures will likely be supported on deep foundations consisting of either precast pre-stressed concrete piles or steel H-piles driven to end-bearing in either glacial deposits or bedrock. The foundation system for the new structures was selected by considering depth to suitable bearing, preliminary structural loading and column spacing, and the need to mitigate potential building settlement. Means and methods for installation of the deep foundation system will consider potential impacts to abutting facilities within the property limits (e.g., the grandstand). Vibration monitoring will be conducted during pile driving activities. It is not anticipated that vibrations will approach thresholds that could potentially impact existing facilities.

  The Casino Area II, Hotel I, and parking garage structures will include one level of below-grade space. Lowest-level floors are expected to consist of framed structural slabs. Small cuts and fills will be required to construct the new structures, but large-scale filling within the proposed building footprints is not expected to be necessary. However, grade raises of up to 10 feet outside Casino Area II, Hotel I, and the parking garage are planned.

- The existing grandstand building to be renovated into Casino Area I will likely be supported on its existing pile foundations coupled with new, supplemental deep foundation elements. It is expected that the lowest level slab for this building will be a reinforced structural slab bearing within a few feet of current existing grades. Supplementary foundation support required for the lowest level slab and possibly columns is expected to include a foundation system associated with low vibrations and low headroom requirements for installation, such as micropiles.

- The proposed maintenance building will likely be supported on pressure-injected footings (PIFs, also known as Enlarged Base Piles), bearing in the marine sand layer approximately 30 feet below ground surface. The proposed maintenance building is expected to bear on either a structural slab or a soil-supported slab-on-grade. Presently, no site filling is planned for this area.

- In an effort to control Project costs and lower the carbon footprint associated with the Project, the intent is to keep soils on-site to the extent possible, thus reducing the need for off-site disposal or transport of soil. Although local soil cuts will be required for building construction, deep excavations requiring extensive lateral earth support systems are not planned. Small excavation support systems may be

required locally for basement, elevator pit, or similar excavations and, given the relatively shallow depth to groundwater in some areas, temporary construction dewatering efforts may be required to allow for construction in-the-dry.

- The lowest-level floor slabs for the new buildings may have under-slab drainage systems and likely will need to be waterproofed.

6.10.4 Project Plans and Specifications

Project design and construction will incorporate measures to detect and avoid potential adverse impacts to nearby structures and facilities. The Proponent will coordinate with abutters prior to and during construction regarding construction methods, potential impacts, monitoring, communication, and mitigation.

Performance criteria will be established in construction contract documents relative to groundwater level maintenance, vibrations, dust control, noise, and other items. The contractor will be required to conform to the performance criteria outlined in the specifications and to take necessary steps during construction to protect nearby facilities and minimize impacts. The contractor will be required to submit reports documenting conformance with requirements to the Project team prior to work. Prior to construction, the contractor will be required to submit to the Project team contingency plans for remedial measures in the event that unacceptable performance occurs.

A monitoring program, including the following, will be performed to establish compliance with performance criteria:

- Groundwater level monitoring during construction dewatering;
- Vibration monitoring during pile driving activities;
- Noise monitoring;
- Dust monitoring; and
- On-site monitoring by the Owner's geotechnical consultant.

6.11 Hazardous Materials and Solid Waste

This section addresses the known existing environmental conditions and potential impacts of contamination on the proposed redevelopment activities. It also discusses management of construction and demolition debris.

6.11.1 Regulatory Status

The Project site was reported to MassDEP by its previous owner, Belle Isle Limited Partnership, on February 21, 1997 for a release in soil and groundwater related to heavy metals, petroleum, and polyaromatic hydrocarbons (PAHs). The reportable conditions were identified during a due diligence environmental investigation completed in association with a real estate transaction and the site was assigned Release Tracking Number (RTN) 3-14857.

Completion of a subsequent subsurface investigation, sampling and testing program of soil and groundwater media and a Method 3 Risk Characterization by Rizzo Associates, Inc. (Rizzo) found that a condition of No Significant Risk to human health or the environment exists at the release areas of the site, and No Significant Risk was identified both for current and future hypothetical residential uses. In February 1998, Rizzo closed the site under the Massachusetts Contingency Plan (MCP) with submission of a Class B-1 Response Action Outcome (RAO) supported by the risk characterization to MassDEP. No Activity and Use Limitation (AUL) has been placed on the property. Details regarding the release and subsequent site closure can be found in the RAO Statement, Suffolk Downs, East Boston and Revere, Massachusetts, RTN 3-14857, February 12, 1998, prepared by Rizzo.

Additional subsurface investigations with soil and groundwater sampling and testing were completed by GEI Consultants, Inc. in 2007. The Phase I/II report notes that chemical testing indicated the presence of low levels of VOCs, PAHs, petroleum hydrocarbons, metals, and cyanide in soil and/or groundwater, which is relatively common at urban sites. Based on the findings, GEI Consultants concluded that no new MCP reportable conditions exist with respect to soil or groundwater. Details from the study and investigation can be found in *Phase I/Phase II Environmental Site Assessment, Suffolk Downs, East Boston and Revere, MA*, GEI Consultants, Inc., February 14, 2007.

Haley & Aldrich has been engaged by the Proponent to provide environmental consulting services during Project design and construction. If contamination is identified in pre-construction sampling or during construction, a Licensed Site Professional (LSP) will provide services consistent with the MCP as required for regulatory compliance and close-out. The Project environmental consultant will ensure that the Project conforms to MCP regulatory requirements for construction of buildings in contaminated areas, and that all required submittals will be provided to MassDEP.

6.11.2 Project Health & Safety Plans

Project health and safety plans to protect worker safety will be created prior to construction and will be included as part of the Contract Documents. Health and safety plans will be detailed documents tailored to meet specific needs at the Project site.

6.11.3 Soil Management

Site-specific information regarding environmental conditions related to the presence of oil and hazardous materials was summarized in the above-referenced reports. Though the Proponent's intent is to limit off-site disposal or transport of excavated soils, foundation construction and associated earthwork activities for the new buildings will likely generate soil that may require off-site transport. The soil will likely consist primarily of urban fill materials generated from pile cap construction and installation of an on-site stormwater recharge system. Chemical testing of the material will be required for acceptance by receiving facilities to confirm chemical constituents and contaminants present. Additional testing of the specific soil material to be generated is planned. Chemical testing of the material will be conducted prior to construction in accordance with facility requirements.

Any material leaving the Project site will be required to be legally transported in accordance with local, state, and federal requirements. In addition, unanticipated conditions related to oil and hazardous materials will be managed in accordance with appropriate MassDEP regulatory requirements. In the event that potential contaminants are detected at levels above reportable concentrations, they will be compared with those previously observed in the historical release under RTN 3-14857. If the contamination is consistent with previous observations, there would be no new reporting obligation to MassDEP under the MCP and construction could be managed outside of the regulatory process as post-RAO construction. If this is not the case and there is evidence of new contamination that is not consistent with that previously observed, then a reporting obligation would exist and construction would need to be completed under a Release Abatement Measure (RAM) Plan within the regulatory process.

6.11.4 Vapor Intrusion

Indoor air quality will be evaluated and tested by the Project environmental consultant, as appropriate, in buildings that are to remain or be renovated. The need for protective measures such as vapor barriers will be determined during final design. The potential for methane migration (from organic deposits) will be assessed by the Project environmental consultant during final design.

6.11.5 Underground Storage Tanks

Based on existing information, one active underground storage tank (UST) exists on site. The existing UST is a 7,000-gallon partitioned gasoline and fuel oil tank located near the northwest corner of the existing building. During construction, the existing UST will be removed and a new UST will be installed near the proposed maintenance building. The Project LSP will ensure that tank removal and closeout is completed in accordance with the MCP and requirements for the city of Revere. In addition, previously-unknown USTs encountered during construction will be managed similarly, as needed.

6.11.6 Summary

Based on available subsurface data and proposed development plans, below-grade construction and earthwork activities are expected to be completed using conventional methods typical for similar construction projects in an urban environment. Appropriate controls and monitoring will be implemented to document compliance with Project requirements.

Based on available soil and groundwater analytical data, subsurface conditions on the Project site are typical of sites in urban environments. Appropriate measures including supplemental investigations, remediation if needed, soil and groundwater management during construction, as well as required regulatory compliance will be implemented if needed to perform the work in accordance with all applicable regulations.

6.12 Detailed Construction Schedule

The Project will be constructed in one continuous phase. Staging plans provided as Figures 6-40 through 6-46 illustrate the anticipated progress of construction throughout the Project site. In general, the stages of construction are divided into the following categories:

Months 1 to 5: Erosion control, perimeter fencing, and protection measures will be installed. Demolition will take place during this stage at the outbuildings, several dilapidated horse barns, administrative building, parking areas, and selective demolition of the grandstand; a demolition plan is provided as Figure 6-47. A crushing plant will be set up on site to reclaim concrete and asphalt materials for reuse at a later date. Initial work will commence to establish the site roadway system and site excavation. Pile driving for the grandstand, garage, CUP, and Casino Area II (partial) will commence. The construction site layout for months 1 through 5 is shown on Figure 6-40.

Months 5 to 8: Site excavation will continue, including pile driving for the grandstand, new maintenance building, and CUP. Work will continue to establish the site roadway system and required staging and laydown areas. The construction site layout for months 5 through 8 is shown on Figure 6-41.

Months 8 to 14: Foundation and superstructure construction will commence for Casino Area II, Hotel I, and the parking garage. Site work will continue on parking areas, and interior construction will be ongoing within the grandstand and clubhouse buildings. The patron parking area will be turned over for the racing patrons. Roadway and utility work will continue throughout the site. The new maintenance building will be completed. The construction site layout for months 8 through 14 is shown on Figure 6-42.

Months 14 to 17: The superstructure for Casino Area II, Hotel I, and the parking garage will be completed, and façade infrastructure will be ongoing. Fit-out of Casino Area I and the clubhouse will continue to completion during this stage. Patron parking areas will be

completed, as will the major roadway infrastructure, the latter of which will be landscaped and turned over for use. The construction site layout for months 14 through 17 is shown on Figure 6-43.

Months 17 to 20: Casino Area I and the clubhouse will be complete and fully operational at this time. The parking garage will be complete and in operation. Casino Area II and Hotel I will be fully enclosed, and finish operations within the buildings will be well underway. Reconstruction of Tomasello Drive, including landscaping, will be completed. The construction site layout for months 17 through 20 is shown on Figure 6-44.

Months 20 to 26: Final finishing activities will be ongoing in Casino Area II and Hotel I, and site finishes and landscaping will be completed for full Resort turnover at the end of the month 25. The construction site layout for months 20 through 25 is shown on Figure 6-45; site layout for month 26 is shown in Figure 6-46.

Route 1A Infrastructure Improvements: Construction of the Route 1 infrastructure improvements will be complete by month 26.

Off-site Roadway Improvements: The Project includes transportation improvements in both the Cities of Boston and Revere. Proposed improvements are memorialized in the HCAs and are described in detail in Section 5.0. Assuming all state and local permits and approvals have been received, construction of these improvements will be completed in accordance with those HCAs. Proposed improvements are shown in Attachment A.

Section 7.0

Greenhouse Gas Analysis

7.0 GREENHOUSE GAS ANALYSIS

7.1 Introduction

This section addresses GHG emissions generated by the Project and options that may reduce those emissions, in accordance with the MEPA Greenhouse Gas Emissions Policy and Protocol (GHG Policy). The GHG Policy requires that certain projects undergoing review by the MEPA Office quantify the project's GHG emissions and identify measures to avoid, minimize, or mitigate such emissions. In addition to quantifying project-related GHG emissions, the GHG Policy also requires proponents to quantify the impact of proposed mitigation in terms of energy savings and GHG emissions.

The analysis provided herein focuses on emissions of carbon dioxide (CO_2). As noted in the GHG Policy, there are other GHGs, but CO_2 is the predominant contributor to global warming. Furthermore, CO_2 is by far the predominant GHG emitted from the types of sources related to the Projects and CO_2 emissions can be calculated for these source types with readily available data.

7.1.1 GHG Policy Summary

The GHG Policy requires the Proponent to calculate and compare the GHG emissions in two cases, each of which incorporates both stationary source and transportation components:

Case 1 is the baseline from which progress in energy use and GHG emissions reductions are measured. The Baseline case would be buildings that are designed to meet the current Massachusetts Building Code (Code) 8th edition, which incorporates the building energy provisions of the International Energy Conservation Code (IECC) 2009. However, pursuant to the Green Communities Act, the Board of Building Regulations and Standards (BBRS) has recently adopted IECC 2012, which will be fully effective on July 1, 2014. In this analysis, as agreed upon with the MEPA Office and Massachusetts Department of Energy Resources (DOER) on May 22, 2013, the Proponent has voluntarily applied IECC 2012 to define the Baseline.

Off-site transportation-related emissions would be modeled for the "build condition", without improvements or mitigation measures proposed by the Project, developed using the standard methodology outlined in the EEA/EOT Guidelines for EIR/EIS Traffic Impact Assessment. Use of onsite fleet vehicles (maintenance, security and shuttle buses, for example) are also included in the analysis.

Case 2 represents the proposed Project, including measures incorporated into the building shell, its MEP systems, lighting design, and other factors that go above and beyond those required for Code compliance.

Boston has elected to include the state's optional Stretch (Energy) Code into its building requirements and the Proponent anticipates that a new Stretch Code (SCII) will be proposed sometime in 2013 and will likely be effective by mid-2014. Although SCII has not yet been proposed by the BBRS, it is anticipated that it will require energy use of new large buildings to be 12-15% below the baseline of IECC 2012. Therefore, since the Project is expected to seek building permits beginning about mid-2014, this analysis targets compliance with the expected SCII as the minimum criterion for energy, and hence GHG, performance.

Transportation analysis for Case 2 includes the effects of roadway modifications and signalization proposed by the Project, and also includes effects of the TDM program proposed as part of the Project. In addition, new or modified fleet vehicle inventory and use is included as a direct source of GHG emissions.

In addition to these two cases, the Policy requires that all feasible mitigation measures that could reduce GHG emissions be considered. The Proponent has evaluated numerous stationary source GHG mitigation techniques comprised of design parameters and applied technologies, and construction and operating parameters, which are **generally referred to herein as "technologies" for convenience**. Some have been adopted, some designated for later evaluation for possible incorporation into the Project as design progresses, and some have been eliminated from further consideration.

7.1.2 Mitigation Technologies

GHG mitigation techniques are a mix of design techniques, applied technologies and operating methodologies. The Proponent has examined approximately 40 mitigation technologies for application to one or both of the Projects. Each technology has been placed in one of four categories:

- "P" - Proposed as part of the Project (included in Case 2);
- "S" - To be studied at some time in the future as design progresses;
- "X" - Rejected or not applicable.

A matrix of the technologies and buildings, and which category a technology falls into, is presented in Table 7-1. This matrix is indicative of the extensive and detailed efforts the Proponent is using to consider, early in the design of each building, various methods to maximize energy efficiency and mitigate GHG emissions.

Technologies grouped under Building Envelope and MEP Systems are the heart of GHG mitigation measures. "Other Related" technologies include additional measures that may indirectly affect GHG emissions, although their primary purpose is to accomplish other goals. For these measures, the GHG emissions reduction potentials are difficult to quantify with any reasonable accuracy and are numerically expected to be a small part of the overall mitigation. They are, therefore, not quantified in this analysis.

7.1.3 GHG Analysis Organization

GHG emissions can be categorized into two groups: emissions related to activities that are stationary on the site and emissions related to transportation. Activities on the site can be further broken down into direct sources and indirect sources: direct sources include GHG emissions from fuel combustion and indirect sources include GHG emissions associated with electricity and other forms of energy that are used on the site and are imported from off-site power plants via the regional electrical grid or local steam distribution system.

Design of the Project and GHG mitigation features included are described in Section 7.2 and energy modeling and GHG emissions of Project buildings are presented in Section 7.3. Mitigation technologies not currently included in the design are discussed in Section 7.4, while emissions and mitigation measures related to transportation are discussed in Section 7.5. The stationary and transportation GHG impacts are combined into a summary GHG analysis in Section 7.6, which also includes a summary of GHG emissions mitigation commitments. Supporting technical analyses are presented in Attachment D.

Table 7-1 GHG Mitigation Technologies Matrix

KEY: P = Proposed (Case 2)
S = to be studied at later design phase
X = Not applicable or not feasible

Mitigation Measure/Technology	New Bldgs					Remarks

7.2 Project Design

7.2.1 Overview

This section describes the various energy efficiency/GHG mitigation technologies that are currently incorporated in the design. Design of the Project is currently in the design development stage for all but Hotel II, which may be designed and constructed by a third party, though, as noted in Section 7.2.8.1, design criteria will be tightly controlled by the Proponent. Assuming issuance of a Category I gaming license, construction of the Project is expected to begin in mid-2014.

At all of its casino resorts, Caesars Entertainment implements an Environmental-Social-Governance sustainability strategy. This strategy, Code Green, is committed to addressing critical issues of energy, waste, water, and carbon emissions and seeks to engage Caesars' employees, guests and suppliers in efforts to reduce natural resource use, conserve energy, and promote reuse and recycling. In the past nine years, Caesars has invested nearly $70 million on energy conservation projects alone and has invested in more than 162 retrofits involving, among others items, energy-efficient lighting, improved air-handling systems, upgraded thermostats, advanced energy-saving sensors, and low-flow water controls and fixtures. Annual savings from these retrofits include in excess of 208 million kWh in energy, over 3.3 million therms in natural gas, more than $24 million in annual resources, and 150,000 tons of GHG emissions.

Building on the Code Green program, the Project will be sustainably designed, energy efficient, environmentally conscious, and healthy for its employees and visitors. Innovative technologies are currently being explored to determine what works best with the Project as well as what might set a visible example for those visiting the site. The Project will become Caesars company-wide standard-bearer for Code Green, putting forward its design innovations as a template for future development projects, renovations and repairs.

At the start of the design process, Caesars implemented an integrated design approach to review and establish applicable sustainable design goals for the Project. To achieve these sustainable goals and commitment to the City of Boston and Revere and the surrounding communities, regular interdisciplinary team meetings have been held since Project inception to ensure a fully integrated approach to sustainability. An interdisciplinary "Green Team" was established to brainstorm, investigate, and recommend potential sustainable design solutions for the Project. The Green Team meets bi-weekly to collectively review research and discuss the viability of implementing the proposed sustainable design measures and energy efficiency building systems components into the Project design.

The Proponent met with MassCEC on February 11, 2013 to explore the Project's approaches to sustainability and the potential for integrating emerging energy technology in conjunction with the design of the Project. MassCEC recommended that the Project

maximize local partnerships and providers whenever possible, which the Proponent has done and is continuing to do. MassCEC also suggested investigating a kinetic energy conversion technology as a possible commercial demonstration of an emerging technology (see Section 7.4.2.9).

The Proponent will utilize the nationally recognized LEED program as administered by the USGBC. LEED for New Construction and Major Renovation 2009 will be utilized to quantify the Project's various metrics relating to sustainability and "green" design. The Project is committed to achieving LEED Gold certification, as described further in Section 2.0.

7.2.2 Building Envelope

7.2.2.1 Orientation

The orientation of a building can have an influence on its energy use. For example, a long wall facing south can increase solar heat gain and maximize the potential for use of natural lighting. However, existing buildings, functional orientation, and other factors may require deviation from an ideal. Some compensation may include use of differing materials on various facades; perhaps reduced glazing on the north side, for example.

Limiting development intensity through an outward-oriented approach and repurposing the historic grandstand building as a casino are central to the overall massing and building orientation. A significant portion of the Project will be renovation of the existing clubhouse, link and grandstand buildings. These existing buildings are located along the track and have a long east-west orientation for optimal viewing of the races. The west façade of the existing grandstand building will be reconstructed to allow for natural daylight to filter into both the ground and second level of Casino Area I. New high performance glazing will be installed to reduce heat loss while maximizing natural daylight.

One major factor in siting the new Casino Area II, Hotels I and II, and the parking garage is the location of the floodplain zone on the site. Given the floodplain and existing racetrack restrictions, the site selected for the new construction is located to the west of the existing grandstand building. A new street pattern grid organizes the site into blocks, arrival courts, plazas, creating an urban streetscape. The blocks establish a series of buildings beginning with Hotel I, Casino Area II, Hotel II, and the winter garden connecting Casino Area I (which is in the renovated grandstand and clubhouse), and a parking structure.

When considering the massing of Hotel I, the initial concept was to reduce the scale and articulate the form with a language appropriate for its urban context. The nine-story Hotel I will be approximately 130 feet tall and will be sited facing east/west, offering the narrowest profile to the Orient Heights neighborhood while providing the opportunity for the form to be self-shading from early morning to late evening. The scale of the massing will be further articulated with a modern tripartite organization of base, body, and top.

7.2.2.2 High Performance Shell

The key elements of the building shell and mechanical component characteristics and efficiencies are presented in Attachment D.1 for both the Baseline and the Proposed Project for comparison. The Proposed case represents the current Project design, including measures incorporated into the building and MEP systems above and beyond those required for Code compliance. The Project is entering the design development stage, so it must be realized that the design presented herein will evolve further with the development process.

High performance low-e glazing paired with enhanced thermal performance wall and roof assemblies will help reduce energy consumption for heating and cooling loads and thermal loss. Significant renovations are planned to the west façade of the grandstand building that will include new exterior wall assemblies with insulation and high performance glazing systems. In addition to the façade upgrades a new roof will be installed with high R-value insulation. The building envelopes of Casino Area I and Casino Area II will also be designed with high performance systems to maximize thermal performance and reduce thermal losses.

As indicated as in Attachment D.1, proposed wall sections insulation value and glazing insulating and heat gain properties all exceed Code requirements. Glazing has been kept to a minimum consistent with the uses of the building. As design is evolving, the hotel glazing has been reduced from the 95% indicated in Attachment D.1 to less than 80%; however, this recent change is not reflected in the modeling presented in Section 7.3.1.

7.2.2.3 Reflective Roofs

Reflective or high albedo roofing aids in minimizing summer urban heat island effects. Light colored or reflective roofing materials with minimum SRI of 78 will cover at least 75% of the Project roofs.

7.2.2.4 Shading Devices

Shading devices are used to screen windows from the direct sunlight and subsequent heat gain of summer days. While use of shading devices will be studied as the design develops, some shading is provided by roof overhangs. The curving southwest façade of Hotel I coupled with interior window control devices will provide shading benefits and help reduce energy consumption. Additional exterior shading devices along the south and east podium façades will control and filter natural light into the ground floor of the casino and retail spaces.

As design detail is not yet available, no credit for shading devices has been included in the building energy modeling reported in Section 7.3.

7.2.3 Energy Supply

The Project includes a CUP containing boilers, CHP units, and chillers that will supply all of the new and repurposed buildings with hot water for space heating, domestic hot water (DHW), chilled water for air conditioning, and electricity. Hot and chilled water will be generated and distributed from the CUP.

7.2.3.1 Space Heating

Hot water for building heating will be generated from excess thermal capacity from the CHP system and by using condensing gas-fired boilers. Condensing boilers are very high efficiency units operating at thermal efficiencies in the 90-95% percent range, compared to approximately 80% efficiency for conventional boilers, which are allowed by Code.

7.2.3.2 CHP and Thermal Storage

The CUP will include two CHP units to produce electricity and hot water. Each CHP unit is comprised of a gas-fired reciprocating engine-generator set that produces 100 kW of electrical energy and, together, will provide approximately 5% of the Resort's annual electricity. Whereas utility power plants generate electricity, primarily from fossil fuels, at approximately 35 to 55% thermal efficiency, rejecting the remaining heat value of the fuel used to the environment, a CHP unit, by recovering otherwise-wasted heat to provide useable thermal energy and thus displacing fossil fuel, can operate at thermal efficiencies on the order of 55 to 85% depending on the design and operating characteristics.

Heat from the engines is captured to generate hot water. The CHP units are capable of supplying all of the DHW needs of the Resort and a portion of the space heating hot water. During the heating season, when the Resort can absorb all of the thermal output of the CHP units, they will operate at full capacity. In the non-heating season, the CHP units will follow the thermal needs for DHW and will operate at part-load most of the time. DHW demand varies with time of day, day of the week and seasonally. To help smooth the load so that the CHP can operate most efficiently, hot water storage is included both in the CUP and at the individual buildings to buffer peaks and troughs in demand.

Annual capacity factor of the CHP units is expected to be approximately 77% and average thermal efficiency approximately 80%, based on preliminary calculations (see Attachment D.3.1). (See also Section 7.4.2.3 for a discussion of other CHP options that were examined.)

7.2.3.3 Domestic Hot Water

The CUP will also include dedicated gas-fired boilers to generate DHW. One or more of these boilers will operate when peaks of DHW demand exceed the CHP units' output, or when one or both CHP units are out of service for maintenance.

7.2.3.4 Chilled Water

High efficiency electrically-driven centrifugal chillers at the CUP, and associated high efficiency cooling towers, will produce chilled water for distribution throughout the Project for air conditioning. Cooling towers will reject excess heat from the chiller cycle to the atmosphere. By using oversized cooling towers, cycle efficiency is improved during part-load operations, reducing annual energy requirements.

The efficiency of electric chillers has improved substantially in the past decade and changes in the Code have required that higher and higher efficiency chillers be utilized. The full load Coefficient of Performance, a measure of chiller efficiency, for the proposed chillers is approximately 10% better than required by the latest version of the Code (see Attachment D.1).

Wintertime "free cooling" will be provided to efficiently serve winter cooling needs and a condenser heat recovery system will be used to preheat incoming potable water. Both measures further increase the efficiency of the chiller plant.

7.2.3.5 PV Electricity Generation

PV systems are being integrated to the largest extent economically feasible in the development of this Project. The goal with the design is to maximize the amount of solar resource deployed without placing an undue annual financial burden on the site with regards to cost of power from the PV system.

A number of options and locations were considered for the installation of the PV collector arrays and equipment. The system types included: ground-mounted systems, roof-top mounted systems, dedicated structures for mounting panels, and parking canopy-mounted systems.

- **Ground-mount:** Ground–mounted arrays consist of PV panels on a framework that sits directly on the ground. Large utility-scale PV installations and landfill applications of PV are examples. While more cost-effective than systems mounted on structures, ground mounted arrays are not currently proposed for the Project, although some areas are still under consideration. Limited availability and competing uses of unused open area and aesthetics are criteria being evaluated.

- **Roof-top:** The traditional PV installation on a building is an array of collectors mounted on a flat or sloped roof, angled to face generally southward and with inclinations from horizontal to a considerable elevation above horizontal. Given the size and configuration of the proposed buildings on this site, it was determined that maximizing the amount of PV that can be mounted on available open roof areas is desirable.

The useable open area on the Hotel I roof is very small due to mechanical penthouses, vents and the lack of parapet walls. Nevertheless, it is being examined further, but not committed to, for potential of approximately 100 kW array. Much of the Casino Area II roof is shaded by the hotel tower or otherwise taken up with mechanical equipment and a greenhouse and is, therefore, not available for PV installation. The Hotel II roof was not considered as that would be a decision to be made by the hotel developer at a later date. Given the small size of the roof and required roof equipment, it is expected to be cost prohibitive to deploy PV on this small footprint.

A small maintenance building is being relocated from the area of the horse barns to an area adjacent to the CUP. This building is being examined for the potential for a small amount of additional PV, but no commitment is being made at this time.

The open roof area on the existing grandstand building, clubhouse, and the link building complex has the capacity for approximately 515 kW of PV capacity.

- **Dedicated Structures for Mounting Panels:** It is increasingly common to mount PV panels on dedicated structures. These structures can be both ground-based "solar tree" or building–based such as structures mounted to the side or on top of buildings. This Project will include a dedicated structure mounted above the top level of the parking garage with a capacity of approximately 930 kW of PV panels.

- **Parking Canopy Systems:** An increasingly common approach to gain unobstructed areas is to install parking canopies with PV panels in parking lots. There are a few examples of this in the Boston area, including the parking lot of the REI store in Framingham. These structures also provide shaded areas for parking cars. This Project will utilize a large section of the north parking lot to install approximately 1,250 kW of PV capacity.

With the roof-mounted and parking garage PV arrays totaling 1,445 kW, this will be one of the largest private building-mounted PV installations in the northeast U.S. and will be the largest in the Commonwealth of Massachusetts.

Thus the Project is currently planning on approximately 2.7 MW of PV capacity on the site, and continues to examine the potential for additional arrays. This 2.7 MW size is used in the energy and GHG analyses in Section 7.3 where it is estimated to produce approximately 10.2% of the annual electricity needs of the Resort.

Owning and operating a large PV system presents many challenges to the Proponent. There are significant capital costs (approximately $13 million for a 2.7 MW system at $5/W), initial risks such as the pending changes in the Solar Renewable Energy Credits (SREC) pricing structure as well as market risk, regulatory reporting requirements, the ongoing process of managing and capitalizing on the SRECs, and continuous monitoring and

maintenance needs of the system(s). Therefore, the Proponent has determined that this Project will use the power purchase agreement (PPA) model. In such an arrangement, a PV specialty company will build, own and operate the PV systems at the facility and sell the electricity produced to the Resort under a long term PPA. This transfers the design, construction and operations to a company whose primary expertise is in the business of design and operation of PV systems, removes the capital and operating burden from the Proponent, and still provides a large quantity of renewable energy, reducing the GHG signature of the Project.

The Proponent solicited proposals from, and held discussions with, several well-established PV providers during the past several months and has recently entered into a Memorandum of Understanding with Tangent Energy Solutions to provide, own and operate the PV systems.

7.2.3.6 Uninterruptible Power Supply (UPS)

The casinos include two 1.5 MW high-efficiency UPS systems to prevent power interruptions from affecting the gaming machines. These inverter-based systems convert line AC power to DC for maintaining a battery system and DC to AC for distribution from the battery system. At 95% conversion efficiency, these units will be state-of-the-art; typical systems are approximately 92% efficient.

7.2.4 Ventilation

The majority of the spaces in the Resort (including gaming, lobbies, food service and back-of-house) will be conditioned via variable air volume air handling systems. Ventilation air preconditioning systems are being utilized for gaming areas (the major HVAC load source) to provide the bulk of the latent cooling/dehumidifying needs. This preconditioning system significantly increases the energy efficiency of the HVAC systems by removing largest source of latent heat gain (moisture in ventilation air) without the need to over-cool and then reheat the entire volume of HVAC supply air. The addition of enthalpy wheels (energy recovery of both latent and sensible heat) to the ventilation air pre-conditioning system further increases the system efficiency by recovering heat from HVAC exhaust air to pre-heat makeup air in the winter, thus decreasing the demand for natural gas for heating. This system also slightly cools and de-humidifies the makeup air during the summer months, thus further decreasing the demand for electricity for cooling/dehumidifying the HVAC ventilation air and natural gas for reheating.

High performance ductwork (ductwork larger than traditional HVAC design) will be used to decrease fan energy consumption by the HVAC system demand-controlled ventilation will be used in high occupancy areas.

The hotel rooms (both hotels) will be served by four-pipe fan coils with ECM motors - a high efficiency, high quality hospitality HVAC solution. Ventilation will be provided to rooms with a heat recovery system for increased efficiency. Retail spaces will also be served with fan coils.

Underground parking areas will be mechanically ventilated, with fan operation controlled by carbon monoxide detectors, greatly reducing fan energy over the course of a day. Above grade parking areas will generally be naturally ventilated.

Premium electric motors will be used for fan and pump drives and variable frequency drives (VFDs) will be used on motors over approximately 5 horsepower.

7.2.5 Lighting

7.2.5.1 Natural Lighting & Advanced Lighting Controls

Natural daylighting will be used throughout the facility, including in gaming spaces that are adjacent to exterior walls. This will allow the lighting control system (which uses photocells, occupancy sensors, and other systems) to dim and shut off artificial lights when they are not needed resulting in significant energy savings. The winter garden between Casino Areas I and II has been designed to maximize the use of daylight.

7.2.5.2 Room Occupancy Sensors

Sensors turn off the artificial lights when a space is unoccupied. Occupancy sensors will be used for the back-of-house spaces such as conference rooms, bathrooms, offices and storage areas. Hotel room occupancy sensors turn off the lights and also adjust the heating/cooling set point when rooms are unoccupied, thereby reducing the energy spent on unoccupied or vacant rooms.

7.2.5.3 High Performance Lighting

High-performance lighting (lower wattage per square foot than the Code minimum requirement) will be utilized. At least a 14% reduction in average lighting power density is expected to be achieved, reducing not only the amount of electricity consumed by the lighting system but also the corresponding energy used by the HVAC system to remove the heat generated by the lights. Lower lighting power levels will be achieved by use of high efficiency fluorescent and/or LED lighting fixtures and bulbs and by focused task lighting in office areas. A lighting plan has not yet been developed, but preliminary LPD values by use category are presented in Attachment D.1.

7.2.5.4 High Performance Lighting, Exterior and Signage

High performance lighting will be applied to exterior lighting and signage. Detailed lighting plans have not yet been developed; therefore, no reduction in exterior lighting energy is included in the modeling in Section 7.3.

7.2.6 Other Process Loads

7.2.6.1 Energy-Star Appliances

Energy Star appliances and electronics utilize less energy than other models of the same type, ranging from 10 to 40% or more depending upon the type of equipment and its use schedule. The Energy Star rating system does not extend to all forms of appliances found in the Project; however, Energy Star appliances and electronics (refrigerators, TVs and computers) will be utilized in the hotels, office areas, break rooms, and other places where rated equipment is available. However, no credit has been taken for this energy savings in the building energy modeling reported in Section 7.3.1.

7.2.6.2 Advanced Elevators

Machine-roomless elevators require less energy to operate than conventional tractor-type elevators. In some applications, programmed controllers reduce elevator trips. The Proponent expects to use machine roomless elevators throughout the Project. State-of-the-art elevators will be examined during design development based upon then-current offerings in the market. To be conservative, no credit for elevator energy reductions has been taken in the modeling reported in Section 7.3.1.

7.2.6.3 Gaming Machines

Gaming machines consume a large percentage of the total electricity use of the Project. The Proponent, together with similar companies in the industry, has been pressuring machine manufacturers to reduce the electrical demand of the machines. A number of advances have been made in recent years, at least in part due to the influence of the Proponent and other industry members on the manufacturers. Some of the advances include:

- Conversion to LED lighting technology that: a) reduces energy consumption per bulb by over 40%, b) reduces heat load per machine at an annual savings in HVAC energy of between $1-3/year per bulb, and c) increases service life per bulb, reducing waste.

- Conversion to coinless operation that: a) reduces energy consumption by elimination of internal coin sorting, and b) reduces mechanical components, thus reducing maintenance.

- Conversion to LCD screens which: a) greatly reduces energy consumption, b) reduces heat load per machine, and c) increased service life per monitor over conventional CRs.

- Adoption of computer-controlled machines and advancement of internal components, eliminating electric motors to spin reels and converting to more efficient computer controlled step motors.

The Proponent continues to challenge manufacturers to improve energy efficiency as well as service life of slot products as technology advances, and considers the energy use of machines when comparing competitive products.

7.2.7 Water Use Reductions

Several features of the Project will reduce water consumption, in turn reducing wastewater generation. Such reductions reduce indirect GHG emissions by reducing the MWRA's water treatment and wastewater treatment energy requirements. These reductions are estimated to reduce water use by more than 28 million gallons/year and wastewater discharge by approximately 4 million gallons/year (see also Section 7.3.2).

7.2.7.1 Low Flow Fixtures

Waterless urinals will be used in public spaces. Low flow (1.28 gpf) water closets and shower heads will be used in hotel rooms and public spaces. Low flow shower heads not only reduce water use but decrease the DHW heating load as well.

7.2.7.2 Condensate Recovery

Condensate from cooling coils will be collected through the rainwater harvesting system for use as cooling tower make-up and irrigation water.

7.2.7.3 Rainwater Harvesting

Rainwater will be collected from building roofs in three tanks totaling approximately 270,000 gallons for use in irrigation and for cooling tower makeup water. It is expected that approximately 4.5 million gallons/year will be recycled in this way, reducing the demand for fresh water from the MWRA system.

7.2.7.4 Drought Tolerant Landscaping

Use of drought tolerant plantings will reduce irrigation water use by an estimated 76% from a baseline of lawns.

7.2.8 Other Related

"Other Related" technologies are technologies that may indirectly affect GHG emissions, although their primary purpose is to accomplish other goals. For these measures, the GHG emissions reduction potentials are difficult to quantify with any reasonable accuracy and are numerically expected to be a small part of the overall mitigation. They are, therefore, described but not quantified in this analysis. They are divided into those that are associated with the operation of the buildings and those that are associated with the design and construction phases of the buildings.

7.2.8.1 Influence with Tenants

The Proponent will undertake several measures to influence restaurant and retail tenant's energy usage, including mandatory provisions in leases and tenant manuals, as well providing access to resources and Caesars' CodeGreen sustainability program. These measures will include, but are not limited to:

- Mandatory participation in food waste recycling program, outlined in all leases.
- Tenants will be automatically included in Caesars quarterly CodeGreen Scorecard that tracks and reports utility cost reduction targets on property in order to encourage GHG reduction.
- Standard language in tenant agreements that allows Caesars to charge tenant for utilities and requires sub-metering to encourage energy efficiency and conservation.
- Caesars will make its corporate resources available to assist tenants with needed support for efficiency projects they wish to pursue and will provide assistance with utility rebates and advice related to other sustainability initiatives upon request.
- Lease materials will include a tenant guide that will encourage LEED certification for tenant space build-outs.

Tenants and their customers are also exposed to CodeGreen collateral that exists at front-of-house locations at most properties as well as any special events that are publicized related to sustainability. In Las Vegas, for example, Caesars coordinates "Lights Out on the Strip" for the World Wildlife Fund's Earth Hour. Caesars also sponsors and hosts Dartmouth's "Big Green Bus" that travels across the country on waste cooking oil to promote sustainability at several properties. These examples expose tenants to actions Caesars is taking at a corporate level across multiple properties to promote a better environment in a visible way.

In addition to the items noted for restaurant and retail tenants, any potential third party developer of the second hotel will be required to build to LEED Gold standards. To further this objective, the second hotel will have the opportunity to connect to the property's CUP.

7.2.8.2 Recycling Areas

Recycling collection staging areas will be included throughout the Project area. The initial metric used to meet this requirement will be the LEED rating system, which requires the provision of collection facilities for paper, cardboard, metal, and plastic. Detailed discussions of recycling are provided in Section 2.2.4.

7.2.8.3 Organic Waste Separation

MassDEP is in the process of rolling out a program of regulations to:

1. require the separation of organic wastes, primarily food waste, from other waste streams at high volume producers such as hotels, conference centers, university cafeterias, and similar sources to keep these wastes out of landfills.

2. encourage the development of biomass-to-energy facilities such as facilities that will anaerobically digest the collected food and other organic waste, recovering methane-rich digester gas for use in small local power generation facilities.

The Project will have two major organic waste streams: horse manure and bedding from the horse barns and food waste from hotels and restaurants in the casino complex. The Proponent investigated the siting of an anaerobic digester within the Project and determined that it is not physically or economically feasible (see Section 7.4.2.8.)

Instead, the Project will incorporate food waste separation into the site collection design and has arranged with Harvest Power, a Massachusetts-based company that is developing an anaerobic digester facility in Massachusetts, to take that waste for processing and energy recovery. As the processing and energy recovery will occur at a third party facility, the GHG consequences are not considered to be part of this Project. Avoiding landfilling of the food waste will reduce fugitive methane emissions, but that is not accurately quantifiable.

The horse barn waste is currently shipped to a composting facility in New Hampshire. Onsite composting is not technically feasible (see Section 7.4.2.8.). As this New Hampshire facility is closer than any anaerobic digester facility anticipated to be in service in the near future, and composting leads to a beneficial product, it is expected that this method of disposal will continue into the intermediate future.

7.2.8.4 Energy Management System (EMS)

An EMS does not reduce the design energy utilization, but rather insures that actual operation comes as close to design optimum as practical. An EMS allows the building manager to monitor building energy performance, which aids in identifying maintenance needs to maintain optimum performance. An EMS should, therefore, be viewed as an insurance mechanism to aid the building manager in attaining the optimum efficiency inherent in the building design.

The facility will have a Direct Digital Control-based Building Management System to enable tracking of energy use and system performance.

7.2.8.5 Enhanced Building Commissioning

Enhanced Building Commissioning, as defined in LEED, begins the commissioning process earlier in the design stage, and also includes a post-occupancy follow-up visit to ensure that building systems have been operating properly in both the heating and cooling season. It, too, is insurance that the construction and operation of the Project and its systems is in accordance with the design.

7.2.8.6 Construction Waste Management

The Proponent will work with its Construction Manager to outline, develop, and implement a comprehensive construction staging and phasing plan. Part of this plan will involve the creation of a comprehensive construction waste management plan. The Proponent is currently anticipating at least a 75% reduction in construction debris diverted to landfill (by weight).

7.2.8.7 Recycled Content Materials

As part of the LEED effort, use of recycled-content materials will be studied during the Construction Documents stage of design. The Proponent desires sustainable design and will encourage the specification of recycled-content materials wherever practical. Concrete aggregate and cement, wood, glass and glazing products, metals, masonry, and drywall are typically evaluated for cost effectiveness of recycled-content alternatives. The Proponent expects to achieve at least 10% use of recycled materials, as defined by LEED.

7.2.8.8 Regional Materials

The Proponent and its Construction Manager will encourage the specification of regionally-sourced materials wherever possible. As part of LEED effort, the design team expects to achieve at least 10% regional materials content by overall construction materials cost per LEED definitions.

7.3 Energy Modeling

7.3.1 Stationary Sources

Building energy modeling was conducted by The Green Engineer, a regionally recognized engineering firm, using the Trane Trace 700 building design model, version 2.6.10. In accordance with the Stretch Code, ASHRAE 90.1 Attachment G protocol was applied in the modeling. As stated previously in Section 7.1, IECC 2012 (ASHRAE 90.1-2010) was used to define the Baseline.

The modeling was conducted for the Project without inclusion of either the CHP units or the PV systems. Building and system input parameters for each case are presented as a comparison table in Attachment D.1. Model output tables of monthly energy use by end user category and annual summaries (Project Cost Budget) for each case are provided in Attachment D.1. Performance of the CHP and PV systems were separately calculated. CHP performance was estimated using manufacturer's data and preliminary analyses of site thermal demands. This calculation is presented in Attachment D.3. PV performance was estimated using ORNL's PV Watts 2 model the output of which is presented in Attachment D.4.

In addition, electric losses due to onsite transformers and distribution and conversion losses of the casino UPS systems were estimated based on past experience and manually added to the model results. Although losses would be greater for the Baseline case, it was conservatively assumed that Baseline and Proposed case losses are the same.

As indicated in Section 7.2, the modeling does not include:

- reduction in glazing in Hotel I, which has been reduced from 95% (as modeled) to less than 80%. This evolution was made too late to include in the model.
- exterior shading devices. Although some shading is currently in the design (but not the model), the design has not fully examined the feasibility of further shading devices.
- use of Energy Star appliances and electronics
- high performance exterior lighting. Lighting design has not progressed sufficiently to include in the model.

Results of the Baseline and Proposed cases, combining the modeled output, CHP and PV performance, and loss estimates are presented in Table 7-2. Associated GHG emissions are calculated in accordance with the GHG Policy.

The energy efficiency and alternative and renewable energy technologies employed in the Proposed design will result in a 69% increase in natural gas use (largely to run the CHP units) which is more than offset by a 28% reduction in imported electricity compared to the Baseline. This results in an approximately 3,210 ton/year, 23% decrease in GHG emissions. Additional GHG emissions reductions are described in Sections 7.3.2 and 7.3.3.

Table 7-3 presents similar information to that in Table 7-2 but as source energy, using site/source conversion factors provided by DOER. Source energy, unlike site energy, takes into consideration that a Btu of electrical energy used onsite requires about 3 Btus to be expended at an off-site power plant due to power plant efficiency as well as transmission

losses. Similarly, a Btu of natural gas used onsite requires off-site supply of almost 1.1 Btus due to gas processing, transmission losses and gas transmission energy (compression) requirements. These conversion factors are not New England-specific.

Table 7-3 indicates that the proposed Project will require approximately 25% less energy use than the Baseline case, which is much better performance than is anticipated to be required by the next version of the Stretch Code, SCII (estimated to be 12-15% reduction from IECC 2012 Baseline).

Table 7-2 Modeling Results – GHG Emissions Reduction

7.3.2 Water and Wastewater-related Emissions Reductions

The Project estimates an daily average water use exceeding 300,000 gallons. For projects with this level of water use, the GHG Policy requires an analysis of the energy reductions, and associated GHG reductions, at MWRA water and wastewater treatment facilities that may accrue due to Project design features that minimize water use and wastewater production. This analysis is presented in Table 7-4.

Water uses can be grouped into two general categories:

- irrigation; and
- building uses (e.g., domestic water supply, utility cooling tower consumptive use).

There are a few minor uses of water that have not been included in the analysis, such as track maintenance, as they are relatively small and unaffected by Project development.

Irrigation water use for the proposed case is estimated based on preliminary planting schedules of drought-resistant plants in designated formal landscape areas and tree and plant beds. This analysis is very preliminary as planting schedules are typically not developed until much later in the design process. A baseline water use was estimated assuming that the same areas are grass lawns.

Building water use reductions arise from use of fixtures that use less water than Code-based fixtures, such as toilets and shower heads, as well as from reductions in utility water demands. Associated wastewater production is estimated to be 80% of water use.

In addition, the Project will practice rainwater harvesting, as described in Section 9.3.2. By collecting rainwater in tanks and using it for both irrigation and cooling tower make-up, water demand from the MWRA system is further reduced. It is estimated that approximately 4.5 million gallons/year will be supplied by this harvested rainwater.

As indicated on Table 7-4, total water use reduction of approximately 31%, or almost 29 million gallons/year and wastewater reduction of 7%, or 4 million gallons/year, will reduce MWRA utility requirements by approximately 10,900 MWh/year and reduce associated GHG emissions by 4,251 tons/year.

Table 7-4 Water Use and Wastewater Generation and Associated GHG Emissions

WATER DEMAND FROM MWRA		million gallons/yr			
		Baseline	Proposed	Difference	Remarks
Non-building uses		26.3	6.3		Irrigation (minor uses for track maintenance not included)
Building uses		66	62		Including domestic water, CUP and cooling towers, restaurants, etc.
Rainwater harvest		0	-4.5		
	Total	92.3	63.8	-28.5	
				-31%	

WASTEWATER TO MWRA		million gallons/yr

	Total	57	53	-4
				-7%

ASSOCIATED ENERGY			MWh/yr	
	Water	18,460	12,760	
	Wastewater	74,100	68,900	
	Total	92,560	81,660	-10,900

GHG EMISSIONS		tons/yr		
		Baseline	Proposed	Difference
	Water	7,199	4,976	
	Wastewater	28,899	26,871	
	Total	36,098	31,847	-4,251
				-12%

Conversion Factors			Sources
within MWRA Water Trtmt	0.2	kWh/kgal treated	MEPA website
within MWRA Wastewater Trtmt	1.3	kWh/kgal treated	
electricity to GHG	780	lbs CO_2/MWh	ISO New England

7.3.3 Other Stationary Source GHG Emissions Reductions

The Resort will acquire Green Energy equal to at least 35% of its electricity use for at least the first two years of operation, or approximately 9,965 MWh of Green Energy. This offsets a similar amount of grid-produced electricity, equivalent to a further 7,772 ton reduction in GHG emissions over the two years, calculated using ISO New England's conversion factor, as required by the GHG Policy.

7.4 Technologies Not Currently in the Design

7.4.1 Building Envelope

7.4.1.1 Green Roof/Podium Areas

With almost all of the available roof area being used to generate solar energy the remaining accessible roof areas will either be shaded, required for mechanical equipment, or occupied by the greenhouse.

7.4.2 MEP Systems

7.4.2.1 Solar Hot Water

Solar hot water (SHW) heating may be a supplement to a typical gas-fired DHW heating system, sometimes providing hot water directly and other times preheating water that is then brought to normal temperature by a gas-fired boiler. In this Project, however, the CHP units already provide essentially all of the DHW required for the Resort. SHW would be an expensive and redundant system and is not in the design.

7.4.2.2 Ground Source Heat Pumps

Ground-source heat pump (GSHP) technology takes advantage of the near-constant temperature of the earth and groundwater, usually at moderate depths below the surface, to provide a heat sink for heat extracted from a building in summer and a heat source when building heating is required in winter. By using a standard vapor-compression refrigeration cycle that is electrically driven, a GSHP system can, under the right circumstances, reduce the energy required to heat and cool a building and, although electricity is GHG intensive, possibly result in a GHG emissions reduction also. The main reason the GSHP systems are more efficient than small packaged DX air conditioning and air-source heat pumps is that they are generally working with a heat sink that is much cooler than most small DX systems in cooling mode and from a heat source that is warmer than an air-source heat pump in heating mode.

There are two distinct sub groups of GSHP systems – open loop and closed loop ground coupling. An open loop system draws in and returns groundwater from one or more wells and can use significantly more pumping energy than a closed loop system. Permitting of an open-loop system is also more intensive due to the potential for impacting groundwater quality. A closed loop system keeps the working fluid in a closed circuit of pipes, relying on heat transfer through the pipe walls to or from the ground and groundwater. In both cases, a large well field is required.

Large amounts of fill were placed on this site during the first half of the last century and the site is still experiencing settling of the upper layers. This settling is quite evident in the immediate vicinity of structural pilings, which do not experience the settling. This settling would create significant problems due to pipe breakage and strain at the well heads where the ground-coupled loop exits each well and travels between wells.

7.4.2.3 CHP

The Project currently includes a 200 kW of CHP units in the CUP with waste heat serving the DHW and some space heating loads.

In comments on the ENF, MassDEP suggested review of a study conducted for the U.S. EPA[1] and an EPA fact sheet related to the Casino market for CHP. MassDEP stated that CHP typically supplies 50-70 percent of the electricity at such facilities. While this may be true of one or more large casino resorts, this 8-year-old market sector study is largely based on hotel size and, in fact, recommends application of CHP in the size range of 90 to 380 kW for a project with less than 500 rooms, as in the case of this Project.

The Proponent investigated the potential for CHP combined with absorption chillers to utilize more thermal output from the CHP, hence potentially allowing use of a larger CHP. The absorption chiller could displace some of the chilled water production otherwise done by electrical centrifugal chillers. By expanding the thermal load served beyond DHW, larger CHP units might be feasible.

The installation of a larger cogeneration system coupled with an absorption chiller was considered; however, due to the high efficiency of the electric chillers selected for the central chiller plant combined with a very effective hydronic economizer (free-cooling) and full air-side economizer capability, the marginal benefits of using a larger CHP with absorption cooling are very small.

Veolia NA, a nationally prominent cogeneration and district heating company conducted a preliminary evaluation of CHP potential for the Project. A number of different configurations were considered, including 130 kW and 250 kW systems from MTU and 500 kW to 1.4 MW systems from GE/Jenbacher. Two large system configuration options incorporating absorption cooling were reviewed in detail:

- Single train of 1.4 MW engine-generator, waste heat boiler and 375-ton absorption chiller
- Two trains of the same configuration for 2.8 MW of electrical capacity and 750 tons of refrigeration

[1] CHP in the Hotel and Casino Market Sectors, Energy and Environmental Analysis, Inc., December 2005

The train configuration was selected because the commercial offerings of an engine and a chiller of these respective sizes match well, allowing most efficient operation.

It was determined that, with the relatively low heating loads, free winter cooling (little or no need for chiller capacity) and other HVAC efficiency concepts in the Project design, the single train would have to either shut down most of the winter or dump excessive amounts of unusable heat. Neither proposition favors implementation of a CHP unit. The two-train configuration extended the excess heat situation to the shoulder seasons and exceeded minimum electrical load often enough that the system would not operate at full capacity even during parts of the summer. Dumping waste heat is counter to the intent of CHP, which is to use the maximum amount of the fuel energy input, and operating below full capacity for extended periods, or shutting down, significantly and adversely affects economics.

Analysis of a 1.4 MW CHP system for this facility is outlined below. From a source-energy and GHG emissions perspective, the use of thermal energy from a CHP system to create cooling benefit has minimal positive impact unless it is compared to a base case of absorption equipment operating directly from a boiler fired with gas (no cogeneration) or a direct-fired absorption cooling unit. Straight installation of new absorption equipment without being combined with cogeneration is very rare due to very unfavorable economics (high first cost and high operating cost). When absorption cooling is compared to a base case of an efficient electric-driven centrifugal chiller system, the overall benefits become much smaller.

If one looks at the overall electric and thermal requirements of a cooling system using an absorption cycle, the 375 ton example below (with a coefficient of performance [COP] of 0.88, the thermal energy input to the absorption equipment is 5.1 MMBtu/hr) offsets the equivalent of 205 kW from a compressor motor in an efficient electric chiller plant but uses 70 kW of additional electric energy for the extra cooling tower capacity, condenser and chilled water pumping needs, hot water pumps, solution pumps, and a boiler feed pump. Thus, the net benefit of using a 375-ton absorption cycle compared to an electric centrifugal chiller is approximately 135 kW.

From a source energy standpoint, 135 kW of electric power uses 409 kW of thermal input (using a 0.33 conversion) or 1.4 MMBtu/hr of source energy. Based on the system sizes and configurations outlined above, the source energy and GHG avoided by using a cogeneration system coupled with an absorption system is a combination of the efficiency gains from the electrical generation efficiency improvement (if any) and the 1.4 MMBtu/hr of avoided electric chiller energy use and not the total thermal output from the cogeneration system (5.1 MMBtu/hr).

An economic analysis, along with details on the system configuration, the operation schedule, and efficiencies of a cogeneration system combined with absorption cooling are outlined below.

System Description

Baseline - electric chiller and condensing boilers

A) Electric chiller based chilled water plant with the following:

a. Chiller efficiency of 0.547 kW/ton (COP = 6.43)

b. Chiller NPLV (full year) = 0.346 kW/ton (COP = 10.16)

c. Chiller NPLV (when operated around hydronic economizer operation) = 0.435 kW/ton (COP = 8.09)

d. Hydronic Economizer (Water-side or plate-and-frame free cooling) for late fall, winter, and early spring cooling needs with an electric efficiency improvement of 0.035 kW/ton as compared to electric needs of an absorption cycle (chilled water and condenser water pumping will be similar to absorption cycle, tower fan energy is 0.018 kW/ton higher for hydronic economizer, and the solution pump, hot water pump, and boiler feed pump energy of 0.053 kW/ton is not needed with an hydronic economizer)

B) Condensing Boilers with 95% average efficiency

Output values from the cogeneration system are based on the following:

a. Full operation of generation and cooling output for 6 months per year

b. ½ of full output of generation and cooling for 1.5 months per year

c. Equivalent of ½ full output for 2 months per year for meeting space heating needs

d. Meets full DHW needs for 10 months per year (10/12 of the 7800 MMBtu/year)

e. Total run-time load profile is full load for 6 months and ½ load for 4.5 months per year (any additional run time will reduce AEC's and require that the additional thermal output be dumped to the atmosphere)

Alternative - 1.4 MW CHP with 375-ton absorption chiller

A) Jenbacher 420 Gas Engine generator set and waste heat recovery boiler

   a. 3,373 kW gas input (LHV) or 3,715 kW (HHV); 12.7 MMBtu/hr

   b. 1,350 kW gross generator output on gas; 1,280 kW net output after extra power requirements for an absorption cycle plant as compared to an electric chiller plant (cooling tower fans 20 kW, pumping increase of 30 kW, absorption solution pumps 5 kW, hot water pumps 8 kW, and boiler feed pump, 7 kW)

   c. net electrical efficiency of 34.5% (HHV-based)

B) Broad quasi-dual effect absorption chiller designed to match up to the two different temperature waste heat streams (steam & hot water) from a Jenbacher 420 engine and waste heat recovery boiler

   a. 375 tons cooling capacity

   b. Cooling COP from thermal use of 0.88

Economic Analysis

Value of Electricity:

At 1,280 kW generated for 6 months and 640 kW for 4.5 months, 7,600,000 kWh/yr are produced. At $0.0796/kWh, this is worth approximately $605,000 per year. If the operation of the cogeneration equipment is sustained throughout the entire peak period for each summer month, the value of the peak demand savings will be an additional $121,000 ($23.62/kW x 1280 kW x 4 months) for the 4 summer months and could be worth as much as $90,000 ($17.65 x 1280 x 4 months) for reducing demand in the winter months. Total Value = $816,000/yr (the $244,000 of demand charge benefit can easily be lost due to system operation interruptions)

Value of Cooling:

Since using the heat from the cogeneration for actual heating purposes is more valuable than using it to run an absorption cooling system, priority will be given to using the heat for heating domestic water and for space heating when heat is needed. Thus, the cooling generated by the absorption equipment will be less than the maximum possible of 375 tons for 6 months per year and 375/2 tons for 1.5 months per year. Of the total of 1,822,500 ton-hours possible with a 375 ton chiller, only 1,233,000 ton-hours will be produced to be able to use the heat for heating needs. This heat will be used in a chiller that will offset a

chiller with a NPLV of 0.435 kW/ton. This reduces the electric needs for the electric chillers by approximately 536,000 kWh/yr which is worth approximately $42,700/yr. Total heat used is 14,800 MMBtu or 4,340 MWh. Total Value = $42,700/yr

Value of Domestic Water and Space Heating:

The cogeneration system can meet approximately 83 percent of the approximately 7,800 MMBtu of domestic water heating needs for the site (due to limiting run-time to periods where more than a small portion of the thermal energy can be used). This will offset the need to purchase approximately 7,650 MMBTU of gas for water heating, which is worth approximately $61,200 per year (with gas at $8.00/MMBtu and 85% eff. boilers). The cogeneration system can also supply approximately 7,000 MMBtu of the projected 9,040 MMBtu of space heating needs for this site. This will offset the need to purchase approximately 7600 MMBtu of gas for space heating which is worth approximately $60,800 per year (with gas at $8.00/MMBTU and 95% eff. boilers for space heating). Total heat output is 14,600 MMBTU or 4,280 MWh. Total Value = $122,000

Value of Alternative Energy Credits from CHP System:

The Alternative Energy Credits (AEC's) for CHP will provide an annual revenue stream from the efficient use of natural gas to provide both heat and electricity. The credit is presently worth approximately $22/MWh and the AEC's are calculated as follows:

$$AEC's = E_{elect}/0.33 + E_{therm}/0.80 - E_{CHPin}$$

For this installation, the AEC's are expected to be:

$$AEC = 7,600/.33 + (4,340 + 4,280)/.8 - 22,070 = 23,030 + 10,775 - 22,070 = 11,735 \text{ MWh}$$

The 11,735 MWh of AEC's are worth approximately $258,000 per year in incentives from the state program.

Benefits Summary:

Electric output	$816,000
Cooling output	$42,700
DHW and Space Heat	$122,000
Value of AEC's	$258,000
Total	$1,238,700/yr

Cost of Natural Gas

Total run-time load profile is full load for 6 months and ½ load for 4.5 months per year. This will require 22,070 MWh of gas input per year (3,715 kW x 6 x 720 plus 3715/2 x 4.5 x 720), or 75,290 MMBtu/yr, which will cost approximately $602,000/year.

Cost of Operations and Maintenance:

The cost of operating and maintaining the engine/generator, the SCR for emissions control, the waste heat recovery boiler and associated equipment, and the absorption chiller is expected to be approximately $0.025/kWh of electrical output from the generator. Based on the load profile outlined above, the cost for operations and maintenance is expected to be $190,000/year.

Cost of Stand-by Electric Charges:

Stand-by charges for capacity for cogeneration are based on a flat monthly charge of $237/month plus $10.35/kW (rated output) per month for the four summer months and $6.25/kW per -month for the remaining eight months of the year. For a nameplate rated demand of 1415 kW, these standby charges would be $132,000 /year.

Cost Summary:

Gas input	$602,000
Maintenance	$190,000
Standby Charges	$132,000
Total Operating Cost	$924,000/yr

Net benefits = $1,238,700 – $924,000 = $314,000/yr.

Capital Costs:

Absorption Cooling Equipment	375 tons @ $2,000/ton	$750,000
Engine genset , waste heat boiler, APC	1,415 kW @ $1,750/kW	$2,476,000
Plant space, CHP and cooling equipt.	1,800 sf @ $400/sf	$720,000
	Subtotal	$3,946,000
Utility Rebate	1415 kW @ $750/kW	-$1,061,250
	Net installed cost	$2,884,750

Simple payback is then $2,884,750/$314,000 = 9.2 years (without financing costs or tax implications). With financing costs, the simple payback period is even greater. This is beyond the generally acceptable payback range for a commercial facility. A similar analysis for the proposed 200 kW CHP facility is presented in Attachment D.3.2 and demonstrates a simple payback period of 3.5 years before financing costs and tax implications.

7.4.2.4 Fuel Cells

Fuel cells use methane (natural gas) in an electro-chemical process operating at low temperature to generate electricity. High-grade or low-grade waste heat recovery, or both, can make these units into a CHP technology.

Fuel cells have been used in limited applications for continuous power generation, but they are very expensive. Although the cost has apparently decreased considerably in recent years, it appears to remain well above $5,000/kW. Even with tax incentives and the potential availability of Alternative Energy Renewable Energy Credits, the cost of fuel cells is considered to be too high for application to the Project. Fuel cells would be redundant to the CHP units.

7.4.2.5 District Heating/Cooling

If a district heating (and sometimes cooling) system is in the vicinity of a project, it may be feasible to take steam and chilled water from such a system, taking advantage of the scale of the source power plant, to obtain cogenerated energy without large capital outlays. This may or may not be a GHG reduction, depending upon the characteristics of the district system.

There is no district system in the vicinity of the Project. Developing the CUP within the Project is, in effect, developing the Resort's own district heating and cooling plant.

7.4.2.6 Wind Turbines

Large and Small Wind Turbines:

Large turbines (greater than 100 kW) are often sited in low-development density areas where a consistent wind resource, unaffected by the built environment, maximizes the payback rate for the installed equipment. Siting facilities in low density areas minimizes wind turbulence, a major contributor to reduced performance and longevity of large-scale wind turbines. The City of Boston and surrounding areas have several urban/suburban installations of larger turbines. Among these are: the Forbes Park complex in Chelsea; Medford Middle School; and the multiple utility-scale wind turbines in Hull. These projects are sited in relatively open areas without tall buildings in close proximity. Large turbines are typically 200-400 ft tall.

For this Project, there is no opportunity for large wind turbines on the site because of its proximity to Logan International Airport. FAA would deem such structure heights as being hazards to air navigation. The Project site is located directly along the centerline of Runway 04L-22R at Logan Airport and MassPort has indicated it does not want large scale turbines deployed at this location.

Small turbines (less than 100 kW), include pole-mounted units in the range of 100 ft tall (hub height – maximum blade tip height is somewhat higher) to modest tower-mounted units up to about 250 feet tall. Structures of that height would be limited to the corner of the site near Orient Heights and Rt 1. Placing a modest turbine close to a residential neighborhood is discouraged by MassDEP noise policy now in the making after citizen complaints about such a siting in southeastern Massachusetts. The Proponent does not believe that there is any suitable location on site for small turbines.

Building-Integrated Wind Turbines

Building-integrated turbines include very small turbines (generally less than 1 kW to about 5 kW) mounted on building roofs or parapets or otherwise attached to a building.

Building integrated turbines are still in the development phase. Most building-integrated turbines have been showplace installations. There a few in the Boston area, including Boston City Hall, MassPort Logan Office Center, and the Museum of Science wind turbine lab.

In general, building-integrated turbines are highly susceptible to performance degradation due to turbulent wind regimes around the buildings they are mounted on as well as nearby structures or topography. In spite of some manufacturers' claims that certain building-integrated designs, such as vertical turbines, are less sensitive to building wake turbulence, there is insufficient commercial experience with these units for most developers to have sufficient confidence that all such issues are resolved. A May 2009 article in *Environmental Building News* indicated that building-integrated turbines are not performing as predicted, have noise and vibration issues, and are a safety and insurance issue. Presentations at the Building Energy 2011 conference in Boston indicated that several types of wind turbines installed at the Museum of Science in Boston and in other southern New England locations have demonstrated similar performance issues.

Furthermore, small turbines within sight of the race track could be a distraction to the horses, inhibiting race operations and perhaps frightening the animals.

Therefore, building-integrated wind turbines are not deemed to be feasible for this Project.

7.4.2.7 Water Source Heat Pumps for the Hotels

Water source heat pumps (WSHP) were considered and not pursued in the hotel component of the Project for two reasons.

Heat pumps are generally considered to be of a lesser quality level than fan coils, in terms of the guest experience, due to their noise and vibration (both higher than a fan coil), as well as the cycling of the compressor (which results in poorer temperature control/stability relative to a fan coil). Heat pumps also have an increased maintenance burden than a fan coil - they are more prone to breaking (again due to the compressor) than a fan coil.

From an energy/infrastructure standpoint, WSHPs are not compatible with the high efficiency chilled water system that was determined to be the preferred (and sustainable) solution for the whole site because heat pumps do not use chilled water - the primary cooling energy transfer medium - as their cooling source. They use condenser water, which would not be available unless pumped a long distance from the cooling towers at the CUP to the hotel. Fan coils backed by a high efficiency chilled water system have comparable energy performance to heat pumps and often perform better. Preliminary modeling was conducted that indicated a performance deficit for WSHP compared to fan coils using source energy as the metric of comparison.

7.4.2.8 Anaerobic Digestion and/or Composting of Organic Waste

Anaerobic Digestion

Anaerobic digestion converts much of the carbon in the waste stream to methane gas, which can be recovered and used as a fuel. The Commonwealth is encouraging the development of anaerobic digestion facilities to process organic waste that will result from recent source separation rules. The Project was examined for its potential to utilize an anaerobic digestion facility to generate fuel for the CUP, displacing natural gas.

On-site anaerobic digestion was determined to be infeasible, as demonstrated herein. The food and food preparation waste stream from the restaurants and other food outlet operations is expected to produce between 2,500 and 3,100 tons of SSO per year when fully operational, and the volume of waste generated at the horse barns is highly seasonal, producing approximately 38,000 cubic yards of manure from the barns each year. The manure production ramps up starting 6 weeks before the start of the 22-week racing season and ramps back down to zero approximately 3 to 4 weeks after the season ends. Presently the leaves and grass clippings from the site are combined with the manure.

A digester cannot effectively process this variation in input volume and would result in the need to either:

- haul in from off-site additional waste for the winter and spring to augment the volume from the food outlets and offset the lack of barn waste, which would require that the site become a waste receiver with all the associated permits, regulations, and associated traffic on the local street, inconsistent with the nature of the Project; or

- supplemental heat would be needed to keep the digester operating in the colder months, reducing the efficiency of recovering energy from the waste.

Furthermore, there is significant need to add water to the material for effective processing and digesting. This water must then be removed after the material exits the digester and the remaining solids dried further. The initial dewatering equipment, further drying and

material handling equipment, and wastewater processing systems require significant additional space. A digester and pre/post processing systems would require three to five acres of space, which is not available at this site. In addition, an anaerobic digestion facility has an industrial appearance that would be inconsistent with the Resort.

Furthermore, the proclivity of waste handling and processing to attract birds could generate an unsafe condition with the close proximity to Logan Airport and aircraft flight paths.

The total annual quantity of waste from the restaurants and barns is between 1/8 and 1/4 of the volume needed for reasonably efficient and economical operation of an anaerobic digestion facility. Therefore, the Proponent sought to partner with 3rd parties developing off-site anaerobic digestion facilities that could take all or part of the Project's organic waste. After considering numerous approaches and entities, Harvest Power was chosen as the preferred provider to work with. Harvest Power is developing an anaerobic digestion facility of regional scale in southeastern Massachusetts that is currently in the permitting process. This facility will receive the separated food waste from the Project, as described in Section 7.2.

Composting

Composting would result in less GHG emissions than landfilling, converting some of the carbon to CO_2 instead of unrecovered or partially recovered methane.

At one time, the Proponent investigated a commercial, fully-enclosed, self-contained composting system (Green Mountain Technologies, Inc.) for the purpose of recovering usable bedding and reducing the volume of manure shipments. This was ultimately rejected because:

- the size and number of systems that would be needed was excessive; and
- it was recognized that the trend towards the use of pelletized bedding (fine sawdust compressed into pellets) is incompatible with the bedding recovery aspect of these types of composter systems.

During its investigation of off-site facilities to receive the Project's organic waste, several haulers and waste companies proposed composting all of the waste. However, the "cleanliness" of the waste stream is very particular for composting. Composting processors reject waste with plastic, glass, bones, or other non-compostable material in it as this material is not desirable in their finished product. Although onsite organic waste separation is designed to minimize plastics and glass, it may not be feasible to entirely eliminate them from the stream. This material is not detrimental, however, to an anaerobic digestor and is generally removed in the digester itself or in the post-digester dewatering and processing stages. Furthermore, sending food waste to an anaerobic digestion facility is desirable in furtherance of the Commonwealth's goal of energy recovery.

Therefore, composting of the food waste fraction of the Project's organic waste streams was rejected.

As described in Section 7.2.8.3, barn waste is currently sent to a composting facility in New Hampshire along with grass clippings and bedding material. As this facility is closer than any anaerobic digestion facility anticipated to be in service in the near future, and composting leads to a beneficial product, it is expected that this method of disposal will continue into the intermediate future.

7.4.2.9 Kinetic Energy Recovery from Vehicle Traffic

In a meeting with MassCEC on February 11, 2013, MassCEC suggested investigating a kinetic energy conversion technology as a possible commercial demonstration of an emerging technology being developed by KinergyPower USA, an affiliate of KinergyPower, a Canadian company.

KinergyPower has a product, patented in the U.S. in 2009, that is designed to recover energy from moving vehicles to run a small generator for producing electric power. The device/process uses a series of movable bars or pads that are connected to short vertical hydraulic cylinders. As a vehicle passes over the pads, the cylinders are pressed down forcing the hydraulic fluid to flow under pressure to a hydraulic motor. With an assembly of hydraulic accumulators, valves, reservoirs, etc., the hydraulic motor can operate, at least for short periods of time, at a constant enough speed and torque to run a small generator for generating electricity. The action of a vehicle rolling over these devices causes a braking or slowing of the vehicle.

Various links to articles regarding KinergyPower include:

http://www.niagarathisweek.com/news-story/3307099-kinergy-power-rolls-forward/
http://www.linkedin.com/company/kinergypower
http://futuristictechnology.page.tl/12-k2--Kinergy-Power.htm
http://masschallenge.org/profile/kinergypower
http://www.zoominfo.com/p/Stefanos-Horianopoulos/1149128573

Research indicated that there are other companies with kinetic energy conversion technologies.

Pavegen – based in England - uses an approximately 4" tall assembly that can be incorporated into a floor system that, when stepped on, generates a small amount of electrical energy. A footfall compresses the slab by approximately 0.2 inches. The technology by which it functions is not disclosed by Pavegen. Pavegen claims to use what it calls a "hybrid black box" to convert the energy of a footstep into electricity, with a mechanism that includes both a piezoelectric effect and induction. The power generated

can be used to run very low power-draw, low-voltage devices. The tiles are reportedly made of recycled polymer, with the surface made from recycled tires. http://www.pavegen.com/

New Energy Technologies MotionPower - Similar to Kinergy Power concept for roadways, this company is based in Columbia, Maryland. The product appears to be in a prototype/development stage and is not commercially available.
http://www.newenergytechnologiesinc.com/technology/motionpower/motion

Kinergy's concept was selected for analysis. This type of device needs to be placed in a location that extracts energy from moving vehicles that need to be either slowing down or descending an incline and would otherwise need to be applying brakes. In effect, the device acts as an external brake, slowing the vehicle. Theoretically, the device will absorb some of the vehicle's kinetic energy and convert it to electricity, reducing the amount of friction braking done by the driver, which results only in waste heat.

An examination of the physics of this device and the potential energy generation from a 100-foot roadway demonstration project is presented in Attachment D.5. The conclusion is that, under an extremely optimistic scenario, approximately 63,500 kWh/year might be generated.

At $0.12/kWh, the electricity generated would be worth approximately $7,500, excluding impact on utility demand charges, if any. These devices are projected to cost between $10,000 and $25,000 per meter of length for the hardware (estimate provided by KinergyPower USA). Additional costs would include mechanical and electrical installation and the cost of facility or roadway modifications required to install the device. For a 100-foot system, the equipment cost alone would be a minimum of $300,000. The payback from energy savings would be that least 40 years. Since the device is projected to have a service life of 10 to 15 years, and the installed cost will likely be a multiple of the equipment cost, the technology does not appear to be economically feasible.

7.4.3 Other Related

7.4.3.1 Enhanced Refrigerant Management

Refrigerants, typically various compounds classified as hydrofluorocarbons (HFCs), are greenhouse gases of stronger effect than CO_2. Releases of HFC, however, are due to leaks or equipment failure and are not routine emissions. Nevertheless, use of low-CO_2e HFCs is beneficial, providing that the functionality of the refrigeration equipment is maintained.

LEED certification requires adopting a refrigeration management system that allows no chloro-fluorocarbon (CFC) use. The Project will be able to achieve this LEED refrigerant management criterion through the appropriate selection of refrigerants and efficient refrigeration systems.

Enhanced Refrigerant Management involves selection of refrigerants with the least combined impact from ozone depletion potential and global warming potential. It includes refrigerant use for commercial refrigeration as well as base building mechanical equipment. Inclusion of the most appropriate refrigerants with a reduced contribution to ozone depletion and reduced GHG-equivalent concentrations will be evaluated throughout the design process with an eye to select the most appropriate, least impactful refrigerant for each piece of equipment based on the specific equipment considered.

7.5 Transportation

This section considers the various categories of vehicles and traffic associated with the project and the effect of mitigation measures to reduce their GHG emissions. Three general categories are examined: fleet vehicles associated with daily operations, including onsite maintenance and security vehicles as well as shuttle services between the Project and off-site locations; traffic generated by the Resort; and diversion of customer trips from Connecticut and Rhode Island casinos to Suffolk Downs.

7.5.1 Fleet Vehicles

Suffolk Downs currently owns and maintains a large number of maintenance fleet vehicles ranging from golf carts to large landscaping trucks. The casino operations will add to this existing fleet with site security vehicles and shuttle buses. The direct GHG emissions from each of these fleets are discussed in detail below.

Maintenance Fleet

Suffolk Downs currently maintains a diverse fleet of more than 30 vehicles which support the maintenance of existing track operations. The age and usage of these vehicles vary widely. The current fleet consists of electric golf carts, general purpose vans and pickup trucks to large specialized vehicles including tractors, a grader, rollers, etc.

The fleet is generally specialized low-use equipment and is in adequate operating order. Their limited use makes it economically unjustifiable to replace them prior to the end of their service lives. As older vehicles are retired or new equipment added, the Proponent will replace them with alternative fuel or fuel-efficient vehicles that are able to perform the necessary operations.

As there are no near-term projections of vehicle replacements, no attempt has been made to quantify potential GHG emissions reductions.

Security Vehicles

Site security at the Resort will require the purchase of security vehicles. The Proponent has committed to purchase all-electric vehicles (Nissan Leaf or equivalent) for this purpose. By purchasing all-electric vehicles instead of conventional gas vehicles the Proponent is eliminating direct emissions of GHG's from the Project, substituting a smaller off-site emission from generation of the electricity to recharge the vehicles.

The U.S. Department of Energy Alternative Fuels Data Center has developed a tool that will compare direct and indirect GHG emissions among electric vehicles and conventional gas vehicles based on the source of the electrical power. This tool estimates that in East Boston substituting all-electric vehicles for conventional gasoline vehicles for site security will reduce GHG emissions by 67%.[2]

The number of site security vehicles has not been determined, nor has the extent of use (vehicle miles) per vehicle been estimated; therefore, the annual reduction in GHG emissions has not been quantified.

Shuttle Buses

Plans for the Resort include establishing a ground shuttle service to bring patrons and employees to and from the MBTA, nearby business districts, cultural and tourist attractions, area hotels, and parking locations. The plan advances the goal of minimizing the impact of Resort traffic on local roads. In furtherance of the City's long-standing commitment to improving air quality through the promotion of public transit and the utilization of clean fuel technologies, the Proponent expects to use a fleet comprised mostly of CNG, LNG, or other alternative fuel buses in the provision of this service. Use of fuel-efficient and alternative fuel vehicles in this shuttle service can lead to significant GHG emissions savings as well as reductions in other pollutant emissions. The precise type and number of bus to be used is dependent on negotiations with the ground shuttle operator, which are ongoing. Routes and schedules will be developed over time to meet actual demand for these services.

The majority of the shuttle fleet is expected be powered by CNG, rather than traditional diesel power. To estimate the GHG reductions achievable compared to a baseline of traditional diesel buses, a preliminary route map and schedule was analyzed, which resulted in an estimated annual 846,000 VMT. Efficiency and emissions factors were

[2] http://www.afdc.energy.gov/vehicles/electric_emissions.php, based on zip code 02128, which corresponds to East Boston.

derived from EPA publications and from a published test report of CNG bus fuel efficiency. CNG combustion produces 27% less GHG than diesel fuel for an equivalent amount of energy[3]; however, differences in fuel efficiency also enter the calculation.

Table 7-5 presents a summary of the calculations, indicating a 254 ton/year reduction in GHG emissions associated with shuttle operations and attributable to the use of this alternative fuel.

This analysis conservatively assumes that all buses are typical large city buses. To the extent that portions of the shuttle service may utilize smaller buses or vans, emissions will decrease. *These numbers will, of course, vary as the variables of bus type, number, route and schedule change with Project development.*

Table 7-5 Shuttle Bus GHG Emissions

	Diesel Bus	CNG Bus
Estimated VMT	845,879 miles/yr [1]	
Fuel Efficiency	5 miles/gal [2]	32.5 scf/mile [3]
Emission Factors [4]	10.15 kg CO_2/gal	0.054 kg CO_2/scf
GHG Emissions	1,889 tons/yr	1,635 tons/yr
	difference	-254 tons/yr

7.5.2 Traffic-related

In accordance with the GHG Policy, GHG emissions were estimated for mobile sources within the transportation study area (see Section 5.0 for the transportation analysis; the study area is illustrated in Figure 5-1). For mobile source GHG emissions, the methodology is outlined in MassDEP guidance for mesoscale analyses.[4] The analysis includes a comparison of the future Build conditions to the No-Build condition. If emissions are

[4] MassDEP, Guidelines For Performing Mesoscale Analysis Of Indirect Sources, May 1991.

greater for the Build conditions, reasonable and feasible mitigation measures will be evaluated. The methodology and parameters for the mesoscale analysis follow methodology approved by MassDEP.

The mesoscale analysis predicts the change in regional GHG emissions due to the proposed Project. The total vehicle pollutant burden was estimated for the 2012 existing conditions and the No-Build and Build conditions for year 2022. Traffic conditions are described in more detail in Section 5.7.

The EPA's MOBILE6.2 computer program was used to estimate motor vehicle emission factors on the roadway network in the Project area. Conservatively, emission factors derived from MOBILE6.2 are based on the worst case of either wintertime or summertime conditions. Daily and yearly emission estimates were calculated using the vehicle count data, mileage between intersections, modeled signalized intersection delay times, and emission factors.

The traffic volumes provided in Section 5.0 form the basis of the study. Peak hour traffic volumes were provided by the transportation consultant. Estimates of Average Daily Trips (ADT) were made from the peak hour volumes assuming a 10% K-factor. Average speeds were assumed for all roadways. Distances for the links were estimated with mapping software.

Average per-vehicle idle times were based on delay times reported in the SYNCHRO intersection modeling output reports provided in Section 5.0 and Attachment A to calculate emissions from idling vehicles.

Case 1, Baseline is intended to represent the difference between the No-Build case and the Build-without-mitigation case. In fact, because of the way in which traffic planning is integrated in the development of the Project, a Build-without-mitigation case does not exist. That is, the overwhelming majority of improvements are so integral to the Project itself that it is not feasible to distinguish between without- and with-mitigation cases as the Project would not exist in the absence of the majority of the improvements already negotiated with city and state agencies.

The Proponent has committed to an extensive program of traffic and roadway improvements under the cities of Boston and Revere HCAs, including the Route 1A flyover over Boardman Street, or other alternatives identified by MassDOT. These improvements are considered to be integral parts of the Project, rather than mitigation per se.

Traffic signal timing and phasing reports will be developed by the Proponent in collaboration with MassDOT, DCR and BTD to define signal timing and phasing improvements, if required. The Proponent will implement the approved traffic signal timing and phasing recommendations prior to receiving a Certificate of Occupancy, if appropriate

In addition, the Proponent has developed a comprehensive TDM program presented in Section 5.9. The proposed TDM program includes the following:

- Designating a Transportation Coordinator;
- Providing bicycle amenities in the form of bicycle storage and bicycle parking;
- Establishing a vehicle management and operations strategy which includes providing electric car charging stations; and
- Promoting travel alternatives.

All but a small portion of the HCA improvements is already reflected in the Traffic Analysis, and hence in the Baseline GHG analysis.

Table 7-6 presents the results of the transportation GHG source analysis for the Project. Baseline results are presented for the study year 2022. All related calculations, including the 2012 and 2022 emissions estimates, are presented in Attachment H.

The Baseline case shows a net reduction in intersection GHG primarily due to the reconfigured intersection of Route 1A and Boardman Street (along with improvements to the intersections of Route 1A with Waldemar Avenue and the North Site Driveway (Tomasello Drive).

As no additional mitigation is included in Case 2, the GHG emissions are the same as Case 1. In fact, there will continue to be adjustments to the traffic planning as work continues, but no additional substantial mitigation measures are expected.

Table 7-6 Transportation-Related GHG Emissions

	Case 1 - Baseline Build w/o mitigation - No Build	Case 2 - Proposed Build with mitigation - No Build
Net VMT, miles/day	37,255	37,255
Net Delay, hrs/day	-18	-18
GHG Emissions, tons/year		
Roadway	7,312	7.312
Intersection	-9	-9
Total	7,303	7,303

7.5.3 Redirected Customers

The Proponent anticipates that some portion of the Resort patrons traveling to Suffolk Downs will be people who are currently patrons of casinos in Rhode Island or Connecticut that instead will travel to Suffolk Downs due to its closer proximity. A third party consultant estimated the revenue that would be recaptured from out-of-State under the Proposed Build case. Caesars then used its proprietary gravity model to estimate the number of trips and distribute those trips geographically by distance rings in order to calculate the net difference in distance traveled in the Proposed Build case over and above the No Build case.

Results presented in Table 7-7 indicate almost 56,000 tons/year of avoided GHG emissions due to an expected reduction of more than 137 million vehicle miles travelled.

Table 7-7 Trip Diversion-related GHG Reduction

Trips to RI/CT Casinos, Origin Distance from Suffolk Downs	# of Trips Diverted	VMT reduction (miles/yr)	Avoided GHG Emissions (tons/yr)*
< 5 miles	78,964	13,792,358	5,607
5- 35 miles	1,030,375	117,691,667	47,846
> 35 miles	142,616	6,116,649	2,487
total	1,251,955	137,600,674	55,939

*Emission factor: 2012 gasoline vehicles, Mobile6 368 gr/mi

7.6 Summary and Mitigation Commitments

7.6.1 Project GHG Summary

Table 7-8 presents a composite of the building and transportation GHG emissions profiles of the Baseline and Proposed cases.

Table 7-8 Project GHG Emissions Summary

	Baseline	Proposed	Difference	
	tons/yr			%
Stationary Sources				
Buildings	13,704	10,494	-3,210	-23%
MWRA energy	36,098	31,847	-4,251	-12%
subtotal	49,802	42,341	-7,461	-15%
Green Energy purchases further reduce GHG emissions by 7,772 tons in the first two years of operation				
Transportation				
Fleet Vehicles	1,889	1,635	-254	-13%
Traffic	7,303	7,303	0	0%
Trip Diversion	na	-55,939	-55,939	
subtotal	9,192	-47,001	-56,193	-611%
Total	58,994	-4,660	-63,654	-108%

Trip diversion savings overwhelm all other Project emissions combined.

7.6.2 Proponent's Commitments to GHG Reduction

The Proponent's commitments to mitigate Project GHG emissions from the stationary sources are extensive, as indicated in Sections 7.2 and 7.3. Numerous additional mitigation measures have not been quantified, primarily because the degree of accuracy or the reliability of the quantification method is uncertain or the Project development has not reached the stage where the item can be adequately defined for quantification.

Designs for the buildings are in the design development stage and will continue to evolve. As the Project develops, the Proponent expects that additional technologies described previously, or possibly new technologies developed in the interim period, will be adopted that will further decrease GHG emissions, but these are not yet ripe for selection. The Proponent will continue to evaluate energy efficiency measures as the design develops.

The Proponent is committed to the following mitigation elements for the entire Resort or for individual buildings:

- High performance building envelopes;
- Light or reflective roofs;

- High-efficiency HVAC equipment;
- 200 kW CHP in the central utilities plant
- approximately 2.7 MW of PV arrays
- Energy recovery ventilation;
- Room occupancy sensors in the appropriate spaces, including hotel rooms;
- High-efficiency interior lighting and reduced lighting power density wherever feasible;
- High-performance exterior lighting;
- Low-flow or waterless plumbing fixtures and water conservation measures;
- Energy Star appliances and electronics;
- Tenant lease provisions that will involve and incentivize tenants directly in energy efficiency design and operations programs.
- Energy management systems;
- Recycling collection areas;
- Construction waste recycling;
- Extensive TDM program as described in Section 5.9;
- Shuttle bus fleet that will utilize alternative fuel vehicles to the maximum extent practicable
- Electric-powered site security vehicles.

The Proponent is committed to implementing the energy efficiency and GHG emission reduction measures presented in this analysis, but must retain an amount of design flexibility to allow for changes that will inevitably occur as design progresses. Case 2 includes a comprehensive estimate of the anticipated GHG reductions that can be achieved based on building energy modeling with preliminary design information. If, during the course of design for an individual building, a specific combination of design strategies proves more advantageous from an engineering, economic, or space utilization perspective, the design may vary from what has been described herein. Energy performance minima (and associated GHG emission reductions), as shown in Tables 7-2 and 7-3 will be adhered to on an overall Project basis.

The Proponent will submit a post-construction self-certification to the MEPA Office that will identify the GHG mitigation measures incorporated into the as-built Resort. Details of the Proponent's implementation of operational measures will be included.

Section 8.0

Historic and Archaeological Resources

8.0 HISTORIC AND ARCHAEOLOGICAL RESOURCES

This section identifies historic resources within and in the vicinity of the Project. A review of the State and National Registers of Historic Places and the survey files of the MHC and Boston Landmarks Commission (BLC), as well as a field review of the areas in the vicinity of the Project, was undertaken to identify historic resources. This section also describes potential direct and indirect impacts to historic resources associated with the Project.

8.1 Historic Resources

8.1.1 Historic Resources within the Project Site

The Project site encompasses the **Suffolk Downs racetrack**, connected **clubhouse** and **grandstand buildings**, **administration building**, **barns**, and ancillary **support buildings**, which are included in the Inventory of Historic and Archaeological Assets of the Commonwealth (Inventory) (MHC No. 209). Constructed in 1935, the facility was the first major racetrack in New England. Originally designed in the International Style, the property has undergone substantial renovations through the years, including enclosure of the grandstand in 1945, major renovations and modifications in 1962 with a new grand entrance and the joining and complete enclosure of the grandstand and clubhouse, a major renovation in 1992, and a series of updates and improvements over the past five years.

The MHC, in their ENF comment letter dated March 26, 2013, requested an updated MHC Form A (Area Form) be submitted prior to the filing of the DEIR. An updated MHC Form A was submitted to the MHC and BLC on July 2, 2013. A copy of the inventory form is included with this DEIR/EPNF in Attachment J.

8.1.2 Historic Resources in the Vicinity of the Project Site

The Project site is located in the cities of Revere to the north and East Boston's Orient Heights neighborhood to the south. A review of the State and National Registers, Inventory, and MHC databases revealed that there are limited previously identified historic resources in the vicinity of the Project area. Directly to the north of the Project site is the Revere Beach Parkway, which is listed in the National Register of Historic Places. To the east of the site in Revere's Beachmont neighborhood is the Our Lady of Lourdes Roman Catholic Church Complex. South of the Project site is the Madonna Queen Shrine and Don Orione Rest Home complex on Orient Avenue in East Boston. In addition, there are two residences on Orient Avenue included in the Inventory. These historic resources are described below.

Table 8-1 lists State and National Register-listed and inventoried properties located within a quarter mile radius of the Project site. The resources are keyed to Figure 8-1.

Table 8-1 Historic Resources within and in the Vicinity of the Project Site

Map No.	*Name*	*Address*
Properties listed in the State and National Registers of Historic Places		
1	Revere Beach Parkway	
Properties included in the *Inventory of Historic and Archaeological Resources of the Commonwealth*		
2	Suffolk Downs	111 Waldemar, Boston
3	Our Lady of Lourdes Complex	1, 2 Endicott Avenue, Revere
4	Residence	54-56 Orient Avenue, East Boston
5	Residence	75-79 Orient Avenue, East Boston
6	Don Orione Complex	111, 120, 150 Orient Avenue, East Boston

Revere Beach Parkway is a curvilinear, 5.3-mile, heavily traveled boulevard that runs between Wellington Circle in Medford and Eliot Circle in Revere. Designed by Olmsted, Olmsted and Eliot, and its successor firm, Olmsted Brothers for the Metropolitan Park Commission, Revere Beach Parkway was originally built in 1896-1905. Throughout its history, the parkway has undergone changes, including having been widened to accommodate increased traffic and to improve crossings and intersections.

Revere Beach Parkway was listed in the National and State Registers of Historic Places in 2007. The National Register boundaries include the parkway corridor and adjacent planted strips and sidewalks, where they exist. Where they do not exist, the boundary is ten feet back from the current edge of the parkway. The National Register nomination identifies original features that contribute to the historic character of the parkway including sidewalks, planted strips, medians, curbs, parking, Boston-type pipe rails, and scenic vistas.

The **Our Lady of Lourdes Roman Catholic Church Complex** is comprised of the Church, Rectory, Garden with Shrine, and Garage (MHC Nos. REV.G, REV.7, REV.83, REV.84, Rev.958). The complex was designed by Maginnis, Walsh and Sullivan in the Neoclassical style in 1907. It is associated with the development of the Beachmont section of Revere in the early twentieth century. The complex was surveyed in 2005 and recommended eligible for inclusion in the National Register of Historic Places.

The **Don Orione Complex** at the top of Orient Heights in East Boston is the national headquarters for the Don Orione religious order. The **Madonna Queen National Shrine** (MHC No. BOS.902), constructed in 1954, features a full-size replica of the statue at the Don Orione Center in Rome, Italy. It was constructed in 1954 by Jewish-Italian sculptor Arrigo Minerbi to show his gratitude to the Catholic Church for having protected him and

his family during World War II. Across the street from the Shrine is the **Don Orione Nursing Home** (MHC No. BOS.113), a nursing home which was also founded by the Don Orione order. The complex includes the **Mother Queen Shrine Chapel** (BOS.114), **Don Orione Rest Home** (BOS.110) and the **Franciscan Sisters of Mary Convent** (BOS 111).

In addition to the Don Orione complex, two nearby properties at **54-56 and 75-79 Orient Avenue** (MHC Nos. BOS.109 and 112) are included in the Inventory. Both are Colonial Revival residences constructed ca. 1915.

8.2 Archaeological Resources

There are no known archaeological resources listed in the State and National Registers of Historic Places or included in the Inventory of Historic and Archaeological Assets of the Commonwealth within the Project site. New construction associated with the proposed Project will be sited on a previously developed parcel consisting of filled land. It is not anticipated that the Project site will impact archaeological resources.

8.3 Impacts to Historic Resources

8.3.1 Construction

Suffolk Downs – Clubhouse, Grandstand, Racetrack, Maintenance Facility, Administration Building, Barns and Ancillary Buildings

The Suffolk Downs racetrack, clubhouse and grandstand buildings will be retained for continued use, supporting the casino and horse racing program. The overall Project is described in Sections 1.1 and 4.3. Specific impacts to Suffolk Downs buildings include renovation of the clubhouse and grandstand buildings, construction of a new maintenance garage and shop building, and retention and repair of the majority of the horse barns. Buildings proposed to be demolished include the administration building, the maintenance building, and four barns.

The clubhouse and grandstand buildings west elevations, facing the new casino and hotel, will be renovated and include a porte cochere at the main entry, the addition of a one-story restaurant retail bay, a one-story glass addition, and winter garden which links Casino Area I and Casino Area II.

The west facade of the existing grandstand building will be reconstructed in an Art Deco style. The facade design will incorporate vertical towers with sculpted geometric pattern motifs.

The grandstand interior will undergo a substantial renovation to accommodate the Casino Area I at the ground floor and the horse racing program at the second and third floors. Existing finishes will be updated and new mechanical systems will be installed. The existing service kitchens and bars will be renovated. The existing elevators and stairs will

be retained throughout the building. Access to the racetrack apron area for viewing live racing events will be provided through existing and new doors located on the track side of the building and a new accessible ramp and elevator at the north end of the clubhouse space.

The existing tiered grandstand building will be retained for viewing of live racing events. The building will undergo a substantial renovation to update interior finishes. Grandstand seating will be a combination of standard stadium seating, enhanced stadium seating, box seating areas, and terraced seating.

The existing maintenance building is in poor condition and cannot meet the existing or projected needs of the horse racing program and resort. The existing building will be demolished and replaced with a new 12,000-square-foot combination maintenance garage and shop building. The building will be a pre-engineered metal building with insulated metal roof and wall panels, structural concrete slab, insulated doors and windows. The building will accommodate multiple functions, including a track superintendent and support staff offices, staff break room and locker room, carpenter shop, plumber shop, electrician shop, upholstery shop, tool rooms, vehicle repair and storage area, and storage.

Now referred to as the office building, the two-story steel frame concrete clad former administration building is situated on the east side of Tomasello Drive, surrounded by surface parking. The flat roof of the building collapsed during a heavy rainstorm in late 2012 and is now vacant, with considerable structural and water damage. The building is proposed to be demolished.

Four dilapidated barns will be demolished. The remaining 25+ barns will be retained and repaired, as needed.

Impacts to the extant buildings, with the exception of the maintenance building, administration building, and dilapidated barns, which are proposed to be demolished, will be positive. The proposed renovations will largely preserve the existing buildings, most importantly the clubhouse and grandstand buildings and barns, as well as the racetrack. The preservation and renovation will allow Suffolk Downs to continue to operate as a premier New England horse racing facility.

Existing conditions site plans and proposed site plans, plans, and elevations for the Project are included in Volume II, Project Figures.

Revere Beach Parkway

As detailed in Section 1.1.1.7 and Section 5.0, the Project includes conceptual improvements at various locations along Revere Beach Parkway to address traffic issues and improve traffic flow. Improvements to Revere Beach Parkway are proposed to address existing traffic, pedestrian, and safety issues and are limited in scope. Transportation improvements are confined to three intersections:

- Route 1 / Revere Beach Parkway (Route 16)
- Revere Beach Parkway (Route 16) / Winthrop Avenue (Route 145) / Harris Street
- Revere Beach Parkway (Route 145) / Tomasello Drive / North Shore Road

Revere Beach Parkway is under the jurisdiction of the Department of Conservation and Recreation (DCR). Route 1, Route 16 northeast of Revere Beach Parkway (Route 145), and North Shore Road are under the jurisdiction of MassDOT. Harris Street is City of Revere jurisdiction as are other local roads. Tomasello Drive is a private way.

The MHC, in their ENF comment letter dated March 26, 2013, requested the DEIR identify any potential alterations to the Parkway associated with the Project. The proposed improvements, while not technically a part of the Project, are proposed as measures to address regional and historic traffic issues required by the Revere and Boston HCAs, and they are described in Sections 1.0 and 5.0. They are further described below, with emphasis on the potential impacts that these proposed improvements may have on Revere Beach Parkway at each of the locations noted above.

Route 1 / Revere Beach Parkway (Route 16)

The proposed conceptual design includes a reconfiguration of the Route 1 southbound off-ramp to Route 16 westbound, construction of a new traffic signal system on Route 16 (southwest of Route 1) which will allow Route 1 southbound traffic to travel Route 16 eastbound (something that is now permitted only by executing a U-turn at Webster Avenue in Chelsea), construction of a new traffic signal system (northeast of Route 1) which will allow Route 16 westbound traffic to travel Route 1 northbound and construction of a new ramp connection from Route 16 to the Route 1 northbound on ramp, a traffic movement that is not currently possible. The existing Route 16 median will be removed at both new traffic signal locations to accommodate the new turning maneuvers. The travel lanes on Route 16 westbound will be revised from two to three lanes within the existing pavement by reducing the width of the existing left shoulder. Finally, an exclusive left turn lane is proposed for Route 16 westbound traffic to travel onto Route 1 northbound.

The conceptual design requires the development of an exclusive left turn lane to accommodate Route 16 westbound vehicles to access Route 1 northbound. To achieve the left turn lane, two alternatives have been developed (see Figures 5-23A and 5-23B). The

figures depict proposed new DCR pavement, new MassDOT pavement, Revere Beach Parkway median modification, and new landscaped areas. Figure 6-23A depicts Alternative 1, which proposes to develop the left turn lane by narrowing the existing Route 16 median. In this alternative the median is narrowed from approximately 10 feet to 6 feet for a length of 630 feet. The total length of median break is 45 feet (new pavement area is 450 square feet) and the total length of median narrowing is 630 feet (new pavement area is 1,260 feet). Figure 5-23B depicts Alternative 2, which proposes to develop the left turn lane by reconfiguring the pavement lane markings further to the east to take advantage of the available pavement width and right shoulder area. The total length of median break is 40 feet (new pavement area is 400 square feet) and there is no median narrowing.

Character-defining elements of Revere Beach Parkway at the Route 1 interchange include:

- Alan J. O'Brien Bridge;
- Sidewalk with planted grass strips;
- Paved median with metal guardrail;
- Cobra head lights; and
- Curvilinear roadway pattern.

As described above, proposed improvements at the Route 1 interchange will require two curb cuts to accommodate the new Route 1 southbound off-ramp and new Route 1 northbound on-ramp. The curbing in this area is replacement bituminous curbing. In addition, the replacement concrete median with modern metal guardrails will require two cuts to accommodate the new Route 1 southbound and northbound ramps. A small amount of new pavement will be acquired from the westbound median to accommodate a westbound left turn lane to access the Route 1 northbound ramp. The improvements have been specifically designed to minimally impact the Parkway.

The Route 1 intersection has been heavily altered since the Parkway was originally constructed. The curbing and median at the Route 1 intersection are not original to the parkway. The proposed improvements will have no impacts to character-defining elements of the parkway at this interchange, including the Alan J. O'Brien Bridge, sidewalks and planted grass strips, cobra head lights, and curvilinear roadway pattern. In addition, the Project will add new landscaped areas north of the Parkway at the reconfigured Route 1 southbound off ramps.

Revere Beach Parkway (Route 16) / Winthrop Avenue (Route 145) / Harris Street

The proposed conceptual design includes improvements to the existing traffic signal system, construction of a second right turn lane from Route 16 eastbound to Winthrop Avenue southbound, and pedestrian safety improvements throughout the intersection.

Three alternatives for this intersection have been developed with variations at Harris Street and Route 16 northeast of Revere Beach Parkway (see Figures 5-24A, 5-24B, and 5-24C). Final determination of the preferred alternative requires further engagement by the City of Revere, DCR and MassDOT. However, in all three alternatives, development of an additional Route 16 eastbound through lane is proposed.

The development of the Route 16 eastbound through lane will require the narrowing of the existing median. The median will be narrowed between 0 and 13 feet for a length of approximately 650 feet. The area of new pavement is approximately 6,100 square feet.

Character-defining elements of Revere Beach Parkway at the Winthrop Avenue/Harris Street intersection include:

- Roadway alignment with marked turn at the intersection;
- Sidewalks with planted grass strips;
- Grassed median east and west of the intersection;
- Cobra head lights; and
- MBTA Bridge No. 4, immediately east of the intersection.

As described above, proposed improvements at the Winthrop Avenue/Harris Street intersection will create a new Route 16 eastbound lane. The improvements have been designed to minimally impact the Parkway, and the widening required to create the new lane will largely utilize existing paved areas that exist within the narrow breakdown lanes, as well as a reduction in the width of the median in the immediate vicinity west of the intersection.

The proposed improvements will have no impacts on character-defining elements of the parkway at this interchange, including the road alignment, sidewalks and planted grass strips, the median east of the intersection, cobra head lights, and the MBTA railroad bridge.

Revere Beach Parkway (Route 145) / Tomasello Drive / North Shore Road

The proposed conceptual design includes improvements to the existing traffic signal systems at North Shore Road and at Tomasello Drive, construction of an exclusive right turn lane from Revere Beach Parkway eastbound to Tomasello Drive and pedestrian safety improvements throughout the intersection (see Figure 5-25).

The conceptual design requires the improvement of the existing left turn lane from Revere Beach Parkway eastbound to North Shore Road. The existing left turn is proposed to be lengthened by approximately 160 feet and the median in this area will be narrowed between 0 and 10 feet. The area of new left turn lane is approximately 800 square feet. The development of the exclusive right turn lane from Revere Beach Parkway eastbound to Tomasello Drive requires approximately 55 feet of new pavement. The area of new right turn lane is approximately 275 square feet. Finally, the improvement of the existing pedestrian crossing on Revere Beach Parkway west of Tomasello Drive and the additional

pedestrian crossings east of Tomasello Drive require addition new pavement as shown in Figure 5-25. The total length of new pedestrian crossing within existing median or grass areas is approximately 47 feet. The area of new pavement for pedestrian crossings is approximately 282 square feet. The existing pedestrian crosswalk to the east of Tomasello Drive will be returned to approximately 270 square feet of landscaped area.

Character-defining elements of Revere Beach Parkway at the Tomasello Drive and North Shore Road interchange include:

- Grassed median east of Tomasello Drive;
- Narrow concrete median east of North Shore Drive, which expands to a wider grassed median further to the west of the intersection;
- Cobra head lights;
- Vertical granite curbing; and
- Sidewalks with grass strips.

As described above, proposed improvements at the Tomasello Drive and North Shore Road intersection are proposed to improve pedestrian safety and lengthen the existing left turn lane onto North Shore Road. The improvements have been designed to minimally impact the Parkway. Minor curb cuts are required to accommodate barrier-free access across the parkway at the Tomasello Drive intersection. The existing paved walkway will be removed and the median restored to landscaped areas.

The proposed improvements will have no impacts on character-defining elements of the parkway at this intersection, including the road alignment, sidewalks and planted grass strips, the median east of the intersection, the grassed median west of North Shore Road, cobra head lights, and granite curbing.

8.3.2 Design and Visual Impacts

Section 4.0 describes urban design goals for the Project. As noted, a master plan for the site establishes a spatial hierarchy of streets, open space, and buildings that bring a human scale to the development. A street pattern grid will be established that organizes the site into blocks, arrival courts, and plazas, creating an urban streetscape. The blocks establish a series of buildings, which include the renovated clubhouse and grandstand buildings, hotels and casinos. Preservation and reuse of the original Suffolk Downs buildings and racetrack is central to the overall massing and organization of the Project program. The new construction has been designed to complement the existing Suffolk Downs facilities and allow for its preservation and continued use.

8.3.3 Shadow Impacts

The Proponent conducted a shadow impact analysis to assess potential Project-related impact that is summarized in Section 6.2 and depicted in Figures 6-3 through 6-17. The shadow analysis focuses on extant buildings, open spaces, residential areas, major pedestrian areas, and plazas in the Project vicinity.

The shadow analysis demonstrates that new shadow impacts from the Project will be minimal, and will not affect any sensitive areas off-site. Likewise, the network of pathways throughout the entry landscape will be unaffected by new shadow, as will most of the open spaces on the Project site.

Shadow impacts to the adjacent clubhouse and grandstand buildings will be limited to late afternoon hours. There will be no shadow impacts to the barns and other ancillary buildings.

Section 9.0

Infrastructure

9.0 INFRASTRUCTURE

9.1 Wastewater

This section describes existing and proposed wastewater management conditions on the Project site.

9.1.1 Existing Wastewater System

Sanitary sewer mapping obtained from City records and on-site field surveys indicates an existing on-site sanitary sewer system in the area of the grandstand and clubhouse. All sanitary sewage generated by the existing buildings flows to a 12-inch gravity sewer line that runs north-south and connects to a private sewer pump station on the south side of the property. This pump station pumps sanitary sewage via a 12-inch force main to an existing Boston Water and Sewer Commission (BWSC) 12-inch sanitary gravity sewer in Waldemar Avenue. This gravity sewer runs easterly in Waldemar Avenue until it ultimately discharges into a 24-inch sanitary sewer main at the end of Waldemar Avenue.

Wastewater is also generated by the existing stable area. The stable area, which is classified as a Concentrated Animal Feeding Operation (CAFO), contains an existing wastewater system that collects stormwater that falls on the ground surface and conveys it to a settling pond in the racetrack infield where it is allowed to settle before being pumped to an existing BWSC sanitary sewer line at the east end of Waldemar Avenue. From there, the CAFO wastewater flows easterly via a BWSC 24-inch sanitary main in Leverett Avenue. Flow is eventually transported by the BWSC sewer system to the ultimate discharge point at the MWRA Deer Island Waste Water Treatment Plant for treatment and disposal.

Existing wastewater flows at the Project site are primarily generated by the CAFO. Since these wastewater flows are generated by storm events, there is no reliable measure of these flows on a daily basis. However, flows discharged to the BWSC system are estimated to be approximately 150,000 gallons per day. No changes are proposed to the existing discharge from the stable area to the BWSC sanitary sewer at the easterly end of Waldemar Avenue. However, the Project will reduce flows from the CAFO since it will convert approximately 2.3 acres of the CAFO into a parking area. The remaining wastewater flow is generated by the existing grandstand and clubhouse buildings. Estimates of daily wastewater flow for the existing Project site were developed by examining two years of water use records (June 2010 to May 2012) provided by Suffolk Downs. Daily water use multiplied by 90% to determine the wastewater estimate of 16,020 gallons per day. Suffolk Downs also provided water use records for water purchased from the City of Revere; however, water purchased from the City of Revere is used in the maintenance areas and for racetrack irrigation. Therefore, these flows are not collected by the on-site sewer system and are therefore not included in the wastewater discharge estimates.

9.1.2 Estimated Wastewater Generation

Wastewater generation estimates for the Project were developed based on wastewater generation rates from MassDEP (310 CMR 15.2), Title V of the State Environmental Code. There are no flow factors for casino uses in 310 CMR 15.2. Therefore reasonable assumptions for flow rates were made for gaming uses based on similar types of uses. For instance, Project engineers assumed that a wastewater flow factor for gaming positions was most similar to the wastewater flow factor for a Lounge or Tavern as described in Title V. Therefore, a wastewater flow factor of 20 gallons per seat was used for gaming positions. Wastewater flow factors for other uses within the Resort were applied to the size of the different uses to develop the following estimates.

These rates represent maximum daily flows, while in reality, actual flows from the Resort are expected to be considerably lower due to the inclusion of efficient design features (e.g., low-flow water fixtures and equipment). The maximum daily discharge for the proposed Resort is estimated as 321,834 gpd (see Table 9-1). The maximum hourly wastewater discharge generated by the Resort is estimated as 1,006 gallons per minute (gpm). These flows do not include any flows for laundry facilities; all laundry for the proposed Resort will be performed off site.

Table 9-1 Anticipated Sewage Generation from the Resort

Project Element	*Size*	*Wastewater Discharge*	*Total Sewer Discharge (gpd)*
Gaming positions (Lounge, Tavern)	7,564 seats	20 gpd/seat	151,284
Office Building	85,083 sf	0.075 gpd/sf	6,381
Function Hall	1,090 seats	15 gpd/seat	16,350
Fast Food Restaurant	568 seats	20 gpd/seat	11,360
Restaurant	1,269 seats	35 gpd/seat	44,415
Factory, Industrial Plant, Warehouse or Dry Storage Space without Cafeteria	60 people	15 gpd/person	900
Motel, Hotel, Boarding House	452 rooms	110 gpd/room	49,720
Country Club, Lockers and shower	530 lockers	20 gpd/locker	10,600
Theater, Auditorium	9,776 seats	3 gpd/seat	29,328
Retail Store	30,000 sf	0.05 gpd/sf	1,500
total			**321,834**

Hourly estimates of sewer discharges from the proposed Project were also developed. Daily sewer flow estimates were converted to gallons per minute flow rates and applied to Merrimack peak wastewater curves developed in Technical Release 16. These curves suggest applying a peaking factor of 4.5 to the gallons per minute sewer flow rate estimate

to determine the instantaneous peak flow rate generated by the facility. The peak flow rate derived from the Merrimack Curves is estimated to be 1,009 gallons per minute. This peak is expected to occur between 9:00 p.m. and 10:00 p.m. on Saturday evenings, when peak occupancy of the Resort is expected to occur. Daily peak flow estimates for the Resort were evaluated on an hourly basis for a typical week based on anticipated occupancy levels and anticipated parking occupancy. Table 9-2 contains a list of expected daily peak flow rates and the related hours of their occurrence.

Table 9-2 Expected Daily Peak Wastewater Flow Rates for the Project.

Day	*Daily Peak Flow Wastewater (gpm)*	*Anticipated Hour of Daily Peak Flow*
Monday	594	7-8 p.m.
Tuesday	599	7-8 p.m.
Wednesday	612	7-8 p.m.
Thursday	619	7-8 p.m.
Friday	907	9-10 p.m.
Saturday	1009	9-10 p.m.
Sunday	785	5-6 p.m.

All Project-generated wastewater will ultimately be conveyed into the BWSC sewer system. Flow generated by Casino Area I, a portion of Casino Area II, the maintenance building, and the parking garage will be conveyed via gravity to a proposed pump station (Pump Station 1) on the northern side of the grandstand building in the vicinity of the CUP. Flow from the remainder of the facility will flow via gravity to a second proposed pump station (Pump Station 2) in the vicinity of the existing pump station on the south side of the site. Pump Station 1 will convey flow via force main to Pump Station 2. All of the existing gravity sewer servicing the existing grandstand building on site will be abandoned and new gravity sewer will be installed.

The existing pump station on the southern side of the Project site will be replaced with Pump Station 2, which will pump directly to the BWSC system. However, the new force main will pump to a sewer manhole located near the MBTA Suffolk Downs pump station at the end of Waldemar Avenue. This configuration differs from the current configuration, whereby the new connection will be downstream of the current connection.

The Proponent will work closely with the BWSC to design the proposed sewer connection to avoid any negative impacts to the existing BWSC 12-inch sanitary sewer main or any sewer lines downstream. In addition, the Proponent will submit a General Service Application and site plan for review as the Project progresses.

The Resort will generate new wastewater flows greater than 50,000 gallons per day; therefore, a Sewer Extension Permit BRP WP 74 will be required from MassDEP. Any wastewater generated from the parking garage via floor drains will utilize sanitary

connections per State Plumbing Code requirements. Any wastewater collected from the garage (e.g., snow melt) will be collected in a plumbing waste system, pass through an approved oil/sediment trap, and then discharge to the sanitary system.

In addition to installing on-site sanitary sewer services for the proposed buildings, the Project will coordinate any necessary sewer main upgrades, improvements, or relocations. If sewer upgrades are necessary, the Proponent will coordinate any necessary design process with BWSC. All new sanitary sewer work will be completed in accordance with the latest local, state, and federal codes and standards.

The Project has been designed to reduce wastewater flow to the extent practical. Plumbing fixtures will be low-flow or waterless: low-flow fixtures will be used in the hotel guest bathrooms; waterless urinals will be used throughout. Cooling tower make-up water and irrigation demand for potable water will be reduced by using captured rainwater for these purposes, thus reducing demand for potable water as well as the amount of wastewater discharged from the Project. Water-efficiency measures are described in Section 9.2.3.

9.1.3 Sanitary Flow Routes

All wastewater generated by the Resort will ultimately be discharged to the MWRA system. Wastewater will discharge to a 24 inch sewer near the MBTA station that is part of the East Boston Low Level Sewer (EBLLS). The EBLLS becomes a 30 inch sewer on Leverett Avenue before expanding to a 36 inch sewer as it flows easterly in Bennington Street. This sewer increases in size to 39 inch by 54 inch sewer that ultimately discharges to the Caruso Pump Station located near the Chelsea Street Bridge. The Caruso Pump Station lifts wastewater flows into the MWRA's North Metropolitan Trunk Sewer which conveys flows to the Deer Island Wastewater Treatment Plant.

9.1.4 Infiltration and Inflow

The Project is proposing all new sanitary sewer lines on the Project site, since the existing sanitary sewer line was installed in the 1930s when the site was initially developed. Due to the age of this line, it is anticipated that a significant amount of infiltration and inflow (I/I) is collected by the existing sewer line. The Proponent has been measuring flows carried by the existing line in an effort to quantify the amount of I/I it conveys. These flows will be reconciled with water meter records as well as precipitation data.

With Project development, a new wastewater collection system will replace the existing sewer line, thus significantly decreasing the amount of I/I conveyed to the BWSC system.

The Proponent acknowledges the BWSC policies regarding offsetting flow increases with reductions in nearby I/I. The Proponent is committed to working closely with the BWSC to provide appropriate mitigation consistent with BWSC goals and policies. Furthermore, the

Proponent acknowledges Boston's 4:1 mitigation requirements as well as fees associated with that requirement, and will work with BWSC to identify projects or incur the appropriate fees.

The Project is not anticipating any additional wastewater connections to the City of Revere system.

9.2 Water Supply

Potable water supply for the Project site is currently provided by the City of Boston, and the Resort will receive water service from the City. The City of Revere provides a daily water supply that is used by the stable, racetrack, and maintenance areas.

9.2.1 Existing Water Supply System

There are five different water systems within the City of Boston that provide service to portions of the City based on ground surface elevation. The five BWSC water systems are southern low (commonly known as low service), southern high (commonly known as high service), southern extra high, northern low, and northern high. There is an existing 8-inch northern high water main beneath Waldemar Avenue.

The Project proposes an upgrade to the existing connection in Waldemar Avenue to serve the proposed Resort. A new water service will be provided in generally the same location as the existing service to the site. The Project will also provide a second looped connection to the existing line in Waldemar Avenue which will be installed close to the Resort entrance from Route 1A.

As described in Section 9.1, Suffolk Downs provided water use records for two years beginning in June 2010 and ending in May 2012 that provide a reasonable estimate of existing water use for the Project site. These monthly records were converted to daily flow estimates, and they indicate the existing flow from the grandstand and clubhouse buildings is approximately 17,800 gallons per day. Records from the City of Revere indicate that water use for the stable, racetrack, and maintenance areas is approximately 22,400 gallons per day.

BWSC record flow test data containing actual flow and pressure for a hydrant in the vicinity of the Project site was not available. BWSC performed flow tests at two hydrants along Waldemar Avenue, results from which are provided in Table 9-3. Additional testing will be required once Project design progresses, as hydrant flow data should be less than a year old when used as a design tool.

Table 9-3 BWSC Hydrant Flow Test Results in Waldemar Avenue.

Flow Hydrant Number	*Date of Test*	*Static Pressure (psi)*	*Residual Pressure (psi)*	*Total Flow (gpm)*	*Flow (gpm) at 20 psi*	*Flow (gpm) at 10 psi*
H128- H130 Waldemar Ave	6/29/2012	102	65	792	2434	2590

9.2.2 Estimated Water Use

The Project design includes installation of a new looped water line, and the existing on-site water line will be abandoned. A new 8-inch CLDI water line will connect to the existing 12-inch water line in Waldemar Avenue, and the new water line will enter the site in generally the same location as the existing line. The water line will be generally contained in the Tomasello Drive alignment and will provide service to Casino Area I, Casino Area II, Hotel I, and the maintenance building (as well as the future Hotel II). Proposed hydrants will be located throughout the site, with the specific locations to be coordinated with the appropriate City of Boston departments.

Section 9.1 describes the methodology used for estimating wastewater flows using Title V flow factors. Estimates of potable water demand for the Resort were derived from the Title V wastewater estimates by adding 10% to the wastewater demands (see Table 9-4). This calculation results in a projected potable water demand of 354,017 gallons per day for water use inside the proposed buildings. Hourly estimates for water demand were also calculated. These estimates were developed from the hourly wastewater demands described in Section 9.1.2.

Table 9-4 Estimated Resort Water Demand.

Day	*Daily Peak Water Flow (gpm)*	*Anticipated Hour of Daily Peak Flow*
Monday	653	7-8 p.m.
Tuesday	659	7-8 p.m.
Wednesday	673	7-8 p.m.
Thursday	681	7-8 p.m.
Friday	998	9-10 p.m.
Saturday	1110	9-10 p.m.
Sunday	864	5-6 p.m.

All new domestic water services will be installed in accordance with current local, state, and federal codes and standards. Backflow preventers will be installed on service connections to prevent backflow contamination of the City's supply system, and water metering will be installed in accordance with BWSC regulations. In addition, since some of

the Project will be located within the floodplain, and floodwaters could conceivably inundate the Project site, domestic water supply utilities will be installed in accordance with local codes and National Flood Insurance Program (NFIP) regulations.

The Proponent will coordinate with the BWSC on the design and capacity of proposed connections to the water system. In addition, the Proponent will submit a General Service Application and site plan for review as Project design progress.

Since potable water for the maintenance building will be supplied by the City of Boston, there may be a decrease in water needs from the City of Revere. All existing connections to the stable area will be maintained, and water use in the stable areas is expected to remain similar to current usage patterns. Outdoor water use related to the racing and stable operations is expected to be similar to current water usage levels. The Project does not anticipate an increase in overall water use for the stable and racetrack operations. Due to the installation and use of the rainwater harvesting tank east of Casino Area I, there may be a decrease in water use from municipal supplies for racetrack watering.

The Proponent will continue to coordinate with the MWRA. Research and review of MWRA plans indicates that there is 30-inch ductile iron water main owned by the MWRA in Winthrop Avenue north of the Project. The Project is proposing to obtain water service from the BWSC lines in Waldemar Avenue, and does not anticipate performing water or sewer work near the MWRA line. Therefore, the Proponent does not anticipate the need for an 8(m) permit from the MWRA at this time.

The irrigation demand for the Resort is estimated to be approximately 34,000 gallons per day, some of which will be supplied from rainwater harvesting and other water conservation measures (see Section 2.0).

9.2.3 Water Conservation

Water conservation measures are incorporated into the Project design to reduce potable water demands on the BWSC water supply system. These measures include rainwater harvesting and reuse, low-flow or waterless plumbing fixtures, and public education. Relative to normal plumbing fixtures, the use of low-flow fixtures and equipment in Resort buildings is expected to reduce water use by approximately 30%, resulting in an annual water use reduction of approximately four million gallons.

The average annual rainfall for the City of Boston is 42 inches, and the Project includes plans to harvest stormwater from building roofs and the parking garage, storing the water in three large cisterns. This harvesting program should be capable of significantly reducing the amount of potable water needed for irrigation. Tank 1 will be located near the front of Casino Area II and will be sized to collect up to 80,000 gallons from the roof of Casino Area II for irrigation use. Tank II will be located in the plaza between the proposed parking garage and Casino Area I, and will be sized to collect up to 130,000 gallons from the

garage and approximately half of Casino Area I roof; this water supply cooling tower water as well as irrigation water. Tank III will be located between Casino Area I and the racetrack where it will collect up to 60,000 gallons to supply water for irrigation water and racetrack watering. The proposed rainwater harvesting tanks will have a collective capacity of approximately 270,000 gallons, and rainwater harvesting activities are expected to reduce potable water demand by up to 4.5 million gallons per year.

Several landscaped areas proposed adjacent to Resort buildings will have moderate irrigation demand, and harvested rainwater will be a principal source of irrigation water, supplemented by potable water when necessary. The Project will further reduce irrigation water demand by planting native and/or drought-tolerant plant species in landscaped areas; in keeping with the restorative site concepts, use of native drought-resistant plants will contribute to reducing potable water use for irrigation by approximately 50%. Although the Proponent intends to maximize the use of rainwater for irrigation, the proposed irrigation system will also be connected to the BWSC potable water supply system. When rainwater harvesting tanks are empty, the proposed irrigation system will draw water from the BWSC system.

Collectively, Project strategies to harvest rainwater, employ low-flow and waterless technologies, and use restorative site concepts in landscaping will reduce potable water use by approximately 8.5 million gallons annually.

9.3 Stormwater Management

This section describes existing and proposed stormwater conditions on the Project site.

9.3.1 Existing Conditions

The existing site is developed, consisting of: one main building that contains the grandstand, clubhouse, and simulcast operations as well as other smaller outbuildings; five parking lots and other paved areas totaling approximately 92 acres of impervious area; a horse racing track; and a CAFO area. The hydrologic analysis excludes a large portion of the ground surface area within the CAFO since this flow is directed to the sanitary system; the roofs of the CAFO area, however, are included in the analysis since they generate stormwater runoff that flows to Sales Creek. Therefore, the total analysis area for the site is 153.51 acres.

The existing Project site does not discharge stormwater to any of the BWSC sanitary or storm sewers. Most stormwater flows from the site discharge either directly or indirectly to Sales Creek, which flows to the Belle Isle Marsh.

9.3.1.1 Existing Drainage Infrastructure

Stormwater generated by the existing Suffolk Downs site is collected using catch basins and is then piped via a closed drainage system to three general design point locations. The design points, which remain consistent in the post-development stormwater design, are a drainage channel along the western property line, Sales Creek, and a wetland located east of the horse track. Most of the existing stormwater management system was constructed in the 1930s prior to the promulgation of MassDEP Stormwater Management Standards. The majority of the stormwater management system provides negligible peak flow attenuation, water quality treatment, and groundwater recharge. Recent improvements to the existing CAFO system included collecting stormwater that falls in the barn and stable area, conveying it to a settling pond within the racetrack infield, and then pumping this water directly to the BWSC sanitary sewer system.

9.3.1.2 NRCS Soil Designations

The Soil Classification Summary outlines the Natural Resources Conservation Services (NRCS) designation of the soil series at the Project site. The majority of soils are classified as Udorthents, wet substratum without a hydrologic soil group (HSG) rating, indicating that the soils are comprised of loamy fill soils likely from the general vicinity. Soils located southeast of the horse track in the wetland are classified as Ipswich mucky and are HSG D (minimal infiltration). Upland soils in the vicinity of the Project site include Newport silt loam and Newport-Urban land complex, which are classified as HSG C.

The on-site wetlands are considered HSG D, and the upland areas are considered HSG C in the HydroCAD calculations. The HSG C designation of the Udorthents was confirmed during on-site soil investigations.

9.3.1.3 On-Site Soil Investigations

Approximately 30 test pits were excavated on the Project site in 2012 by Haley and Aldrich, Inc. Depth of the test pits ranged from 4 to 13 feet, with most being excavated to a depth of 6 feet. Results of the test pits were generally consistent throughout the site. Soil test pit logs indicate the soil classification based on the Unified Soil Classification System (USCS). Throughout the entire site, soil in the test pit logs is considered fill. Generally, the top 24 inches of soil are classified as either poorly graded sand (SP) or silty sand (SM). Below 24 inches, the soil is mostly unclassified fill, SP, SM, or clayey sand (SC). In test pits close to Route 1A, silt (ML) and organic silt (OL) was found below 24 inches.

Historical measurements of observation wells have indicated groundwater levels at the Project site are 0.5 to 16 feet below ground surface, and are generally on the order of 2 to 6 feet below grade. In recent test pit explorations completed for this Project, groundwater was typically observed at depths of 2.5 to 7 feet below site grades. Seasonal fluctuations in groundwater levels can also be expected.

9.3.1.4 Total Maximum Daily Load

Stormwater from the Project site discharges primarily to Sales Creek and secondarily to wetlands or drainage channels on the east and west sides of the Project site, which are located within the Boston Harbor watershed. MassDEP has issued a Draft Pathogen Total Maximum Daily Load (TMDL) for the Boston Harbor Watershed (excluding the Neponset River) to address bacterial and other fecal-related pollution. The proposed stormwater management system and long-term pollution prevention measures will minimize the discharge of pathogens to adjacent resource areas. The Project will reduce impervious area on the site and will not have any illicit sewer or septic discharges, thereby minimizing potential pathogen sources. To reduce pathogens in stormwater discharging from the Project site, a reduction in impervious area, bioretention basins, biofiltration swales, pervious pavers, and rainwater harvesting tanks are proposed. The Project meets the intent of the Draft TMDL to reduce pathogens discharging within the Boston Harbor Watershed.

9.3.1.5 Concentrated Animal Feeding Operation

Stormwater from the ground level in the CAFO area is collected by a closed drainage system that is routed to a settling pond located in the racetrack infield, where water is then pumped to a sewer manhole located near the Suffolk Downs MBTA station. The Project will convert approximately 2.3 acres of CAFO to parking, so stormwater flow from that area will be removed from the CAFO system and will no longer flow to the settling pond and sanitary sewer system. To represent this in the pre-development calculations, a 2.3-acre area of the CAFO ground surface is included in pre-development catchment areas. This 2.3 acre area does not tie into the site stormwater runoff discharge in the pre-development calculations. In the post-development calculations, the runoff from this area will be incorporated into the stormwater management system.

Reducing the size of the CAFO ground surface will reduce the sanitary flows generated at the ground surface, effectively increasing the capacity of the existing CAFO treatment system. This will contribute to the improvement of the Sales Creek water quality.

9.3.2 Proposed Stormwater Management

The Project includes installation of a stormwater management system that is being designed to meet and exceed MassDEP Stormwater Management Standards, City of Boston stormwater requirements, and City of Revere stormwater requirements. As a redevelopment project, the Project is required to improve existing conditions to the maximum extent practicable. The Project will reduce peak stormwater flows, remove a minimum of 80% of TSS from stormwater flows, and collect and infiltrate the equivalent of the one-inch storm event over the proposed impervious area. The Project will reduce impervious area by approximately 14 acres on site, which is perhaps the most significant improvement to the

stormwater system relative to existing conditions. In addition, the stormwater management system will incorporate water quality treatment and infiltration facilities that are not currently present on the Project site.

The Project has been designed using environmentally sensitive site design and LID techniques. This design prevents the generation of stormwater and non-point source pollution by reducing impervious surfaces, disconnecting flow paths with biofiltration swales, treating and infiltrating stormwater at bioretention basins, and protecting natural processes taking place in surrounding resource areas. Stormwater systems have been designed to model natural hydrologic features, including promoting infiltration throughout the site.

The proposed stormwater management system for the Project site includes three sizable rainwater harvesting cisterns capable of collecting up to 270,000 gallons of water, porous pavers, deep sump and hooded catch basins, infiltrating bioretention basins with sediment forebays, biofiltration swales, and proprietary water quality structures. Overflow from the proposed BMPs will discharge to the existing design points via stormwater outfalls. Stormwater outfalls that discharge to Sales Creek will include rip rap aprons to prevent erosion, and outfalls at the wetland design points will use level spreaders to promote sheet flow between the outfall and wetland resource area.

Deep Sump and Hooded Catch Basins

Deep sump and hooded catch basins are proposed to provide pretreatment in impervious areas of the parking lot and roadway. Catch basins will also be installed within the bioretention areas as overflow devices.

Stormceptor® Water Quality Structures

Stormceptor® water quality structures will be used for water quality pretreatment in areas of the site where space is limited or additional pretreatment is required prior to discharge. These BMPs are designed to remove a minimum of 80% TSS. Generally, Stormceptor water quality units will be used to treat runoff generated by the parking area that discharges directly to Sales Creek.

The existing drainage system in the CAFO area will be protected and maintained. Recent stormwater improvements associated with the site, including the racetrack improvements and the sediment sump parallel to Sales Creek north of the racetrack, will be protected and maintained.

All stormwater generated by the Project will either be infiltrated into the ground or discharged directly or indirectly to Sales Creek or existing wetlands or drainage channels on the west side of the Project site. There will be no direct discharges to the BWSC sanitary or

storm sewers. Stormwater will not be discharged to the City of Revere sanitary or storm sewers. All discharged water will be of a much higher quality than the stormwater currently discharged from the Project site due to BMPs incorporated into the design.

Tables 9-5 through 9-9 summarize the reduction in peak flow rates from the Project for the three design points used in the drainage analysis.

Table 9-5 Peak Rates of Runoff for Design Point DP1 – Culvert invert west side (cfs)

Storm Event	*2-year*	*10-year*	*25-year*	*100-year*
Existing	73.89	121.60	152.44	190.04
Proposed	68.42	117.74	150.10	189.78

Table 9-6 Peak Rates of Runoff for Design Point DP2 – Stream contributing to Sales Creek (cfs)

Storm Event	*2-year*	*10-year*	*25-year*	*100-year*
Existing	39.20	63.60	79.30	98.42
Proposed	37.67	61.99	77.71	96.88

Table 9-7 Peak Rates of Runoff for Design Point DP3 – Sales Creek (cfs)

Storm Event	*2-year*	*10-year*	*25-year*	*100-year*
Existing	238.91	387.62	483.35	599.88
Proposed	225.67	371.69	465.58	580.40

Table 9-8 Peak Rates of Runoff for Total Site (cfs)

Storm Event	*2-year*	*10-year*	*25-year*	*100-year*
Existing	351.99	572.82	715.10	888.34
Proposed	331.75	551.12	693.38	867.05

Table 9-9 Volumes of Runoff for Total Site (acre-feet)

Storm Event	*2-year*	*10-year*	*25-year*	*100-year*
Existing	25.32	41.82	52.74	66.28
Proposed	23.82	40.00	50.78	64.19

Both the peak rates and volumes shown in the tables above are conservative. For purposes of this document, the drainage analysis was performed without taking into account any infiltration or any stormwater retention/detention in the bioretention basins. As Project design progresses, the infiltration and retention/detention effects of these bioretention basins will be incorporated into the calculations. In addition, reductions in flows resulting from the rainwater harvesting tanks are not accounted for. Therefore, all the figures shown above are conservative in nature. Actual figures will result in greater reductions in peak flows and volumes.

9.3.2.1 Low-Impact Design

An important principle of LID is minimizing impervious area to manage stormwater as close to the source as possible. The Project will reduce impervious area on the site by approximately 14 acres, thereby restoring a significant portion of the existing site to permeable ground covers which help treat stormwater as a resource rather than a waste product. The primary treatment BMPs used to treat stormwater runoff from the proposed impervious area are bioretention basins, which treat stormwater closer to the source than other treatment options and use designed soil media to mimic the natural movement of water within the soil profile for treatment and groundwater recharge. Other elements of the stormwater management design that treat runoff close to or at the source are porous pavers and biofiltration swales.

LID is recognized as an effective method for mitigating the effects of climate change, which is discussed in greater detail in Section 2.0.

Reduction in Impervious Area

By reducing impervious area on the Project site, the Project will reduce the rate and volume of stormwater runoff leaving the Project site while promoting groundwater recharge. Annual recharge from the post-development site will exceed the annual recharge from pre-development conditions solely by reducing impervious area. By reducing runoff volume and increasing recharge volume, there will be more infiltration which will provide water quality treatment, improving the quality of water entering Sales Creek. In other words, in the post-development condition, there will be more groundwater base flow entering Sales Creek and less surface-generated runoff.

Biofiltration Swales

Biofiltration swales (or grassed channels) will be used to break up the impervious area and provide pretreatment in the north parking lot. Due to the level of expected activity in this parking lot, the biofiltration swales will be lined to prevent infiltration. Therefore, the biofiltration swales will provide water quality treatment only.

Porous Pavers

Porous pavers are proposed in areas that will not be highly trafficked, but instead will be used as pedestrian areas with minimal vehicle activity. Porous pavers are not proposed in parking areas where high-intensity use is anticipated. The porous pavers will replace traditional impervious concrete and allow runoff to be treated and infiltrated within the pavement section.

9.3.2.2 On-Site Stormwater Retention

Bioretention Basin with Sediment Forebay

Six bioretention basins are proposed to treat stormwater runoff where feasible on the proposed site, including the southern half of the proposed Tomasello Drive, South Lot, drop-off circle near the entrance to Casino Area II, and surrounding walkways and plaza areas. The bioretention basins will include a minimum 30-inch media filter to provide TSS and nutrient pollutant removal and will provide infiltration.

Pretreatment for the bioretention basin will be provided by deep sump and hooded catch basins and a sediment forebay. The sediment forebays are designed in accordance with the MassDEP Stormwater Management Handbook to provide a water quality volume equivalent to 0.1 inches per impervious acre.

Consistent with BWSC requirements, the bioretention basins have been designed to store and infiltrate a volume of stormwater equal to one inch from all proposed impervious areas associated with the Resort. Given the proposed site design, 203,800 cubic feet must be stored and infiltrated on-site. Table 9-10 describes the volume of stormwater that will be stored and infiltrated on the Project site by each bioretention basin.

Table 9-10 Proposed Recharge Volumes for Stormwater BMPs

Infiltration BMP	*Recharge Volume (cf)*
Bioretention Basin 1	52,219
Bioretention Basin 2	50,614
Bioretention Basin 3	15,247
Bioretention Basin 4	29,414
Bioretention Basin 5	49,160
Bioretention Basin 6	26,004
Total	**222,658**

Calculations for the proposed infiltration include the proposed buildings. Stormwater generated from those building rooftops will be collected and stored in rainwater harvesting tanks. Therefore, the calculated volume is conservative and the amount of storage provided in the bioretention basins exceeds the City of Boston requirements.

Rainwater Harvesting

Stormwater runoff from the roofs of the buildings and approximately half of the parking garage areas will be collected and stored in three large rainwater harvesting tanks. Rainwater harvesting tanks will be located in three areas. Tank I will be located to the front of Casino Area II/Hotel I and will be sized to collect up to 80,000 gallons. This tank will collect stormwater generated from the roof of Casino Area II and be used for irrigation water. Tank II will be located in the plaza area between the garage and Casino Area I and will be sized to collect up to 130,000 gallons. It will collect stormwater generated by the proposed garage and approximately half of Casino Area I. This water will be used to supply cooling tower water as well as irrigation water. Tank III will be located between Casino Area I and the racetrack. Tank II will collect up to 60,000 gallons per day and will supply water to be used for irrigation water and track watering. The proposed tanks will be capable of storing up to 270,000 gallons, and harvesting rainwater is expected to reduce potable water demand by up to 4.5 million gallons per year.

The volumes that will be retained on the Project site by the rainwater harvesting tanks have not been included in the overall infiltration calculations. However, water collected in these tanks represents a significant amount of water that will not be discharged off-site during storm events.

9.3.3 Compliance with MassDEP Stormwater Management Policy Standards

The Project is a located on a previously-developed site and will result in a *decrease* in impervious area, and therefore is considered a "redevelopment" as defined in the MassDEP Stormwater Management Standards. Since the Project is a redevelopment project, it is required to meet the following Stormwater Management Standards to the maximum extent practicable: 2, 3, and the pretreatment and structural BMP requirements of Standards 4, 5, and 6. Existing stormwater discharges will comply with Standard 1 only to the maximum extent practicable. A redevelopment project shall also comply with all other requirements of the Stormwater Management Standards and improve existing conditions.

The Project site will be designed to meet and exceed MassDEP Stormwater Management Standards as summarized below:

Standard 1: *No new stormwater conveyances (e.g. outfalls) may discharge untreated stormwater directly to or cause erosion in wetlands or waters of the Commonwealth.*

Compliance: The Resort will not discharge any untreated stormwater directly to or cause erosion in wetlands or waters of the Commonwealth. Stormwater from the site will be collected and treated in accordance with MassDEP Stormwater Management Standards, and stormwater outfalls will be stabilized to prevent erosion. This is a significant improvement over existing conditions.

Water quality treatment BMPs have been incorporated into the stormwater management system to provide increased TSS removal relative to existing conditions. Bioretention basins, deep sump and hooded catch basins, proprietary hydrodynamic separators, and biofiltration swales have been incorporated into the design and sized to provide at least 80% TSS removal. The BMP sizing calculations are included with the Stormwater Report. Rip rap at the new outfalls will be designed to avoid erosion or scour at the outfall or into the wetlands or Sales Creek.

Standard 2: *Stormwater management systems shall be designed so that the post-development peak discharge rates do not exceed pre-development peak discharge rates. This Standard may be waived for discharges to land subject to coastal storm flowage as defined in 310 CMR 10.04.*

Compliance: The proposed stormwater management system will be designed so that the post-development peak discharge rates do not exceed pre-development peak discharge rates at the design points and for the site as a whole. To prevent storm damage and downstream flooding, the proposed stormwater management practices will mitigate peak runoff rates for the 2-, 10-, 25-, 50- and 100-year 24-hour storm events. The reduction in impervious area in the post-development condition will also reduce the volume of stormwater being discharged from the site for the 2-, 10-, 25-, 50-, and 100-year 24-hour storm events, exceeding the requirements of Standard 2.

Standard 3: *Loss of annual recharge to groundwater shall be eliminated or minimized through the use of environmentally sensitive site design, low impact development techniques, stormwater BMPs, and good operation and maintenance. At a minimum, the annual recharge from the post-development site shall approximate the annual recharge from pre-development conditions based on soil type. This Standard is met when the stormwater management system is designed to infiltrate the required recharge volume as determined in accordance with the Massachusetts Stormwater Handbook.*

Compliance: The Project will comply with this standard. Site design has been environmentally-sensitive, using LID techniques and stormwater BMP treatment trains to improve groundwater recharge. Annual recharge from the post-development site will exceed the annual recharge from pre-development conditions based on soil type using guidelines provided in the MassDEP Stormwater Management Handbook.

The Project will improve groundwater recharge on site. Since the Project will actually *reduce* impervious area on site, no groundwater recharge is required based on the MassDEP Stormwater Management Standards. However, the use of LID techniques will provide groundwater recharge. Also, the bioretention basins are designed to retain and infiltrate a volume equivalent to one inch of water from the on-site impervious area to meet the City of Boston Stormwater requirements. Proposed recharge volumes for the bioretention basins are quantified in the Stormwater Report.

Standard 4: *Stormwater management systems shall be designed to remove 80% of the average annual post-construction load of Total Suspended Solids (TSS). This standard is met when: Suitable practices for source control and pollution prevention are identified in a long-term pollution prevention plan, and thereafter are implemented and maintained; Structural stormwater BMPs are sized to capture the required water quality volume as determined in accordance with the Massachusetts Stormwater Handbook; and Pretreatment is provided in accordance with the Massachusetts Stormwater Handbook.*

Compliance: The proposed stormwater management system will be designed to remove at least 80% of the average annual post-construction load of TSS. Structural stormwater BMPs including deep sump and hooded catch basins, bioretention basins, porous pavers, water quality swales, biofiltration swales and Stormceptor® water quality units are sized to capture the required water quality volume (1 inch over the Project site impervious area) and remove a minimum of 80% of TSS.

Proposed water quality treatment BMPs are subject to the 44% TSS removal pretreatment requirement and the one-inch rule for calculating water quality volumes because the site is considered a land use with higher potential pollutant loads (see Standard 5).

Pretreatment for all infiltration BMPs will meet or exceed the 44% TSS removal requirement. The treatment train for runoff that is not directed to an infiltration BMP will include at a minimum deep sump hooded catch basins, and a proprietary treatment device

to remove at least 80% TSS prior to discharge to Sales Creek. Lined biofiltration swales will also be used in parking lot islands prior to the deep sump hooded catch basins where enough space is available. TSS removal calculation spreadsheets and Stormceptor® sizing calculations are provided in the Stormwater Report (see Attachment F).

Source control and pollution prevention measures such as vacuum cleaning, street sweeping, proper snow management, and stabilization of eroded surfaces are included in the Long-Term Pollution Prevention Plan and Operation and Maintenance Plan located in the Stormwater Report.

Standard 5: *For land uses with higher potential pollutant loads, source control and pollution prevention shall be implemented in accordance with the Massachusetts Stormwater Handbook to eliminate or reduce the discharge of stormwater runoff from such land uses to the maximum extent practicable. If, through source control and/or pollution prevention, all land uses with higher potential pollutant loads cannot be completely protected from exposure to rain, snow, snow melt and stormwater runoff, the proponent shall use the specific structural stormwater BMPs determined by the Department to be suitable for such uses as provided in the Massachusetts Stormwater Handbook. Stormwater discharges from land uses with higher potential pollutant loads shall also comply with the requirements of the Massachusetts Clean Waters Act, M.G.L.c. 21, §§ 26-53 and the regulations promulgated there under at 314 CMR 3.00, 314 CMR 4.00 and 314 CMR 5.00.*

Compliance: The parking lots associated with the site are considered high-intensity-use and Land Uses with Higher Potential Pollutant Loads (LUHPPLs) as defined by MassDEP. These areas are classified as a LUHPPL based on average daily vehicle trips anticipated to be generated by the proposed Resort.

The Project is a redevelopment and therefore the pretreatment and structural BMP requirements of Standard 5 are required to be met to the maximum extent practical. However, the proposed design meets this requirement. The treatment train for the portions of the parking lot that do not flow to the bioretention areas include Stormceptor proprietary treatment devices which capture sediments as well as free oil. Treatment trains for the remaining parking lot areas include deep sump hooded catch basins and sediment forebays prior to the bioretention areas.

Standard 6: *Stormwater discharges within the Zone II or Interim Wellhead Protection Area of a public water supply and stormwater discharges near or to any other critical area require the use of the specific source control and pollution prevention measures and the specific structural stormwater best management practices determined by the Department to be suitable for managing discharges to such areas, as provided in the Massachusetts Stormwater Handbook. A discharge is near a critical area if there is a strong likelihood of a significant impact occurring to said area, taking into account site-specific factors. Stormwater discharges to Outstanding Resource Waters and Special Resource Waters shall be removed and set back from the receiving water or wetland and receive the highest and*

best practical method of treatment. A "storm water discharge" as defined in 314 CMR 3.04(2)(a)1. or (b) to an Outstanding Resource Water or Special Resource Water shall comply with 314 CMR 3.00 and 314 CMR 4.00.[1] *Stormwater discharges to a Zone I or Zone A are prohibited unless essential to the operation of the public water supply.*

Compliance: The Project primarily discharges to Sales Creek, which is part of the Rumney Marshes ACEC. The Project is a redevelopment and therefore the pretreatment and structural BMP requirements of Standard 6 are required to be met to the maximum extent practical. Pretreatment BMPs were selected from Table CA 2: Standard 6 of the Massachusetts Stormwater Handbook and include deep sump hooded catch basins, sediment forebays, and biofiltration swales in selected portions of the Project. Table CA 2 indicates appropriate BMPs for use on sites with stormwater discharges to Outstanding Resource Waters. The main treatment BMPs are exfiltration bioretention basins, which are included in Table CA 2. Although the Project is only required to meet this Standard to the maximum extent practicable, this Standard is met fully by the proposed design.

Standard 7: *A redevelopment project is required to meet the following Stormwater Management Standards only to the maximum extent practicable: Standard 2, Standard 3, and the pretreatment and structural stormwater best management practice requirements of Standards 4, 5, and 6. Existing stormwater discharges shall comply with Standard 1 only to the maximum extent practicable. A redevelopment project shall also comply with all other requirements of the Stormwater Management Standards and improve existing conditions.*

Compliance: Since the Project is a redevelopment project, the following Stormwater Management Standards are required to be met to the maximum extent practicable: 2, 3, and the pretreatment and structural BMP requirements of Standards 4, 5, and 6 (see compliance narrative for Standards 2, 3, 4, 5, and 6). However, this Project will comply with all of the requirements of the Stormwater Management Standards and improve existing conditions (see compliance narratives for Standards 8, 9, and 10).

Standard 8: *A plan to control construction-related impacts, including erosion, sedimentation, and other pollutant sources during construction and land disturbance activities (construction period erosion, sedimentation, and pollution prevention plan) shall be developed and implemented.*

Compliance: The Project will comply with this standard. Sedimentation and erosion controls will be incorporated as part of the design and will be employed during site construction. Land disturbance will be kept to a minimum and the phasing of work will be planned so only areas being developed are exposed. All other areas should have natural vegetation preserved, good temporary cover, or permanent vegetation established. Permanent structures, temporary or permanent vegetation, and mulch/erosion netting

should be employed as quickly as possible after land is disturbed. Disturbed areas will be protected from stormwater runoff by installing erosion control or stormwater management measures to prevent water from entering and running over disturbed areas and to prevent erosion damage to downstream facilities. Perimeter control practices will be installed to isolate the construction site from surrounding areas. Siltation fence, temporary covers for drainage structures, and temporary settlement basin will be utilized where applicable.

Since the Project will disturb more than one acre of land, a Notice of Intent will be submitted to the U.S. EPA for coverage under the NPDES CGP. As part of this application the Applicant is required to prepare a SWPPP and implement the measures in the SWPPP. The SWPPP, which is to be kept on site, includes erosion and sediment controls (stabilization practices and structural practices), temporary and permanent stormwater management measures, Contractor inspection schedules and reporting of all SWPPP features, materials management, waste disposal, off-site vehicle tracking, spill prevention and response, sanitation, and non-stormwater discharges. A draft SWPPP is provided in the Stormwater Report (see Attachment F).

Standard 9: *A Long -Term Operation and Maintenance (O&M) Plan shall be developed and implemented to ensure that stormwater management systems function as designed.*

Compliance: A post-construction operation and maintenance plan has been prepared and will be implemented to ensure that stormwater management systems function as designed. Source control and stormwater BMP operation requirements for the academic campus are summarized in the Long-Term Pollution Prevention Plan and Operation and Maintenance Plan provided in the Stormwater Report.

Standard 10: *All illicit discharges to the stormwater management system are prohibited.*

There will be no illicit discharges to the stormwater management system associated with the Project. An Illicit Discharge Compliance Statement is provided in the Stormwater Report.

9.3.4 Consistency with NPDES General Permit

The site contractor will be responsible for stormwater management of the active construction site and will be required to adhere to the conditions of the 2012 Construction General Permit under the U.S. EPA. A draft SWPPP has been prepared in accordance with MassDEP Stormwater Management Standards and the 2012 Construction General Permit (see Attachment F).

9.4 Anticipated Energy Needs

9.4.1 Natural Gas Service

Natural gas will provide energy for heating (both space heating and domestic hot water generation), cooking, and power generation via a gas-fired reciprocating engine that will be the basis of a CHP cogeneration installation. Space heating will be generated via high-efficiency (condensing) boilers. Domestic hot water will be generated via the CHP system, supplemented and backed up by boilers.

9.4.2 Electrical Service

Electrical power will be provided to the Project from a local utility company and distributed throughout at 13.8 kV. Power will be transformed and further distributed within the building, powering lighting, equipment, and plug loads.

Emergency, life safety, and standby power will be provided via two diesel-powered standby generators (expandable to five generators in the future).

9.4.3 Telecommunications

Telecommunications service will be provided by Verizon and distributed throughout the site.

9.5 Energy Conservation

Multiple energy conservation strategies will reduce Project energy consumption, including:

- PV arrays will generate approximately 2.7 MW;
- A CHP installation will provide heat and power to the Resort while producing fewer GHGs than the equivalent utility-fed system;
- High efficiency mechanical equipment will be used to provide heating and cooling;
- Advanced lighting controls and architectural daylighting strategies will take advantage of natural light and reduce artificial lighting;
- Heat recovery devices will reduce the amount of waste heat (including moisture) that leaves the facility;
- High performance air system design will reduce the energy required to move heating and cooling energy around the facility;
- High efficiency plumbing fixtures (low flow and waterless fixtures) will reduce the consumption of domestic hot water, reducing heating energy consumption;

- Economizer cycles (using air and water) will use outside, untreated air to cool the space when possible;
- A high performance envelope will reduce envelope heat gain and loss; and
- Metering provisions will allow the owner to monitor and improve building operations to reduce energy consumption.

Section 10.0

Proposed Section 61 Findings and Mitigation

10.0 PROPOSED SECTION 61 FINDINGS AND MITIGATION

In accordance with M.G.L. c. 30, Section 61 and 301 CMR 11.12(5), any State Agency that takes Action on a project for which the Secretary required an EIR shall determine whether the project is likely, directly or indirectly, to cause Damage to the Environment and shall make a finding describing the Damage to the Environment and confirming that all feasible measures have been taken to avoid or minimize the Damage to the Environment.

Contents of Section 61 Findings (301 CMR 11.12(5)(a)): In all cases, the Agency shall base its Section 61 Findings on the EIR and shall specify in detail: all feasible measures to be taken by the Proponent or any other Agency or Person to avoid Damage to the Environment or, to the extent that Damage to the Environment cannot be avoided, to minimize and mitigate Damage to the Environment to the maximum extent practicable; an Agency or Person responsible for funding and implementing mitigation measures, if not the Proponent; and the anticipated implementation schedule that will ensure that mitigation measures shall be implemented prior to or when appropriate in relation to environmental impacts.

Section 61 Findings and Agency Action (301 CMR 11.12(5)(b): Provided that mitigation measures are specified as conditions to or restrictions on the Agency Action, the Agency shall:

1. make its Section 61 Findings part of the Permit, contract, or other document allowing or approving the Agency Action, which may include additional conditions to or restrictions on the Project in accordance with other applicable statutes and regulations; or

2. refer in its Section 61 Findings to applicable sections of the relevant Permit, contract, or other document approving or allowing the Agency Action.

Subject Matter Jurisdiction Limitations (301 CMR 11.12(5)(c)): In the case of a Project undertaken by a person that requires state permits or land transfers, but no funding, the Scope of any EIR is limited to those aspects of the project that are within the subject matter of the permit(s) or within the area subject to a land transfer that are likely, directly or indirectly, to cause damage to the environment. Any Participating Agency shall limit its Section 61 Findings, or any mitigation measures specified as conditions to or restrictions on the Agency Action, to those aspects of the Project that are within the subject matter of any required Permit or within the area subject to a Land Transfer. In the words of the MEPA statute (M.G.L. ch. 30, sec. 62A), "Any finding required by section sixty-one shall be limited to those matters which are within the scope of the environmental impact report, if any, required by this section."

State Agencies that will be required to make Section 61 Findings for the Project prior to issuing permits for, funding, or otherwise implementing the Project include or may include MassDEP, MassDOT, DCR, MWRA, and the Massachusetts Gaming Commission.

Depending on agency procedures, as described above, the various Section 61 Findings may be part of permits or agency actions, or may be stand-alone documents. Moreover, agencies will generally limit Section 61 Findings to impacts and mitigation within the scope of the subject matter of their permits (e.g., MassDEP Section 61 Findings will address wastewater, if the project requires a permit related to wastewater).

The Proposed Section 61 Findings below and the subsequent sections contain commitments the Proponent has made as a basis for respective agency Section 61 Findings. These commitments include mitigation measures for potential impacts related to transportation, air quality, wetlands, GHG emissions, wastewater, water use, and stormwater. See also the Summary of Impacts and Mitigation Measures, Table 10-1.

10.1 MassDEP Proposed Section 61 Finding

Project Name:	Caesars Resort at Suffolk Downs
Project Location:	East Boston and Revere
Project Proponent:	Sterling Suffolk Racecourse, LLC
EOEA Number:	15006
Date Noticed in Monitor:	

These Findings for Caesars Resort at Suffolk Downs (EEA #15006) have been prepared in accordance with the provisions of M.G.L. c. 30, Section 61 and 301 CMR 11.00. On [DATE] the Secretary of Energy and Environmental Affairs issued a Certificate stating that the Project's Final Environmental Impact Report (FEIR), dated [DATE], adequately and properly complied with the Massachusetts Environmental Policy Act and its implementing regulations.

Caesars Resort at Suffolk Downs presents a unique opportunity to re-energize the Project area with a mixed-use urban resort casino development. The Project program includes two distinct gaming areas (referred to herein as Casino Area I and Casino Area II), up to 450 guestrooms in two hotels, a multi-purpose meeting/entertainment space, dedicated structured parking, fine dining, retail space, and sports bars as well as surface parking and a maintenance building. The Proponent proposes to construct substantial infrastructure improvements on Route 1A in the vicinity of the Project site as an integral part of the Project, and the Project also includes a number of other transportation-related improvements.

As this Project is currently described, the following permits will be required from the Department:

- Sewer Connection Permit;
- Plan Approval or Environmental Results Program Certification;
- Demolition Permit;
- Asbestos Removal Permit (if required); and
- Superseding Order of Conditions (only upon appeal of local Order).

Based upon its review of the MEPA documents, the permit applications submitted to date, and the Department's regulations, the Department finds that the terms and conditions to be incorporated into the permit required for this Project will constitute all feasible measures to avoid damage to the environment, including consideration of the potential effects of climate change, and will minimize and mitigate such damage to the maximum extent practicable for those impacts subject to the Department's authority (see the appended Mitigation Table). Implementation of the mitigation measures will occur in accordance with the terms and conditions set forth in the permit.

10.2 MassDOT Proposed Section 61 Finding

Project Name:	Caesars Resort at Suffolk Downs
Project Location:	East Boston and Revere
Project Proponent:	Sterling Suffolk Racecourse, LLC
EOEA Number:	15006
Date Noticed in Monitor:	

These Findings for Caesars Resort at Suffolk Downs (EEA #15006) have been prepared in accordance with the provisions of M.G.L. c. 30, Section 61 and 301 CMR 11.00. On [DATE] the Secretary of Energy and Environmental Affairs issued a Certificate stating that the

Project's Final Environmental Impact Report (FEIR), dated [DATE], adequately and properly complied with the Massachusetts Environmental Policy Act and its implementing regulations.

Caesars Resort at Suffolk Downs presents a unique opportunity to re-energize the Project area with a mixed-use urban resort casino development. The Project program includes two distinct gaming areas (referred to herein as Casino Area I and Casino Area II), up to 450 guestrooms in two hotels, a multi-purpose meeting/entertainment space, dedicated structured parking, fine dining, retail space, and sports bars as well as surface parking and a maintenance building The Proponent proposes to construct substantial infrastructure improvements on Route 1A in the vicinity of the Project site as an integral part of the Project, and the Project also includes a number of other transportation-related improvements.

As this Project is currently described, the following permits will be required from the Department:

- Vehicular Access Permit (Category III); and
- Non-Vehicular Access Permit.

Based upon its review of the MEPA documents, the permit applications submitted to date, and the Department's regulations, the Department finds that the terms and conditions to be incorporated into the permit required for this Project will constitute all feasible measures to avoid damage to the environment, including consideration of the potential effects of climate change, and will minimize and mitigate such damage to the maximum extent practicable for those impacts subject to the Department's authority (see the appended Mitigation Table). Implementation of the mitigation measures will occur in accordance with the terms and conditions set forth in the permit.

10.3 DCR Proposed Section 61 Finding

Project Name:	Caesars Resort at Suffolk Downs
Project Location:	East Boston and Revere
Project Proponent:	Sterling Suffolk Racecourse, LLC
EOEA Number:	15006
Date Noticed in Monitor:	

These Findings for Caesars Resort at Suffolk Downs (EEA #15006) have been prepared in accordance with the provisions of M.G.L. c. 30, Section 61 and 301 CMR 11.00. On [DATE] the Secretary of Energy and Environmental Affairs issued a Certificate stating that the Project's Final Environmental Impact Report (FEIR), dated [DATE], adequately and properly complied with the Massachusetts Environmental Policy Act and its implementing regulations.

Caesars Resort at Suffolk Downs presents a unique opportunity to re-energize the Project area with a mixed-use urban resort casino development. The Project program includes two distinct gaming areas (referred to herein as Casino Area I and Casino Area II), up to 450 guestrooms in two hotels, a multi-purpose meeting/entertainment space, dedicated structured parking, fine dining, retail space, and sports bars as well as surface parking and a maintenance building The Proponent proposes to construct substantial infrastructure improvements on Route 1A in the vicinity of the Project site as an integral part of the Project, and the Project also includes a number of other transportation-related improvements.

As this Project is currently described, the following permits will be required from the Department:

- Access Permit.

Based upon its review of the MEPA documents, the permit applications submitted to date, and the Department's regulations, the Department finds that the terms and conditions to be incorporated into the permit required for this Project will constitute all feasible measures to avoid damage to the environment, including consideration of the potential effects of climate change, and will minimize and mitigate such damage to the maximum extent practicable for those impacts subject to the Department's authority (see the appended Mitigation Table). Implementation of the mitigation measures will occur in accordance with the terms and conditions set forth in the permit.

10.4 MWRA Proposed Section 61 Finding

Project Name:	Caesars Resort at Suffolk Downs
Project Location:	East Boston and Revere
Project Proponent:	Sterling Suffolk Racecourse, LLC
EOEA Number:	15006
Date Noticed in Monitor:	

These Findings for Caesars Resort at Suffolk Downs (EEA #15006) have been prepared in accordance with the provisions of M.G.L. c. 30, Section 61 and 301 CMR 11.00. On [DATE] the Secretary of Energy and Environmental Affairs issued a Certificate stating that the Project's Final Environmental Impact Report (FEIR), dated [DATE], adequately and properly complied with the Massachusetts Environmental Policy Act and its implementing regulations.

Caesars Resort at Suffolk Downs presents a unique opportunity to re-energize the Project area with a mixed-use urban resort casino development. The Project program includes two distinct gaming areas (referred to herein as Casino Area I and Casino Area II), up to 450 guestrooms in two hotels, a multi-purpose meeting/entertainment space, dedicated structured parking, fine dining, retail space, and sports bars as well as surface parking and a maintenance building. The Proponent proposes to construct substantial infrastructure improvements on Route 1A in the vicinity of the Project site as an integral part of the Project, and the Project also includes a number of other transportation-related improvements.

As this Project is currently described, the following permits will be required from the Authority:

- Sewer Use Discharge Permit (or waiver); and
- Dewatering Permit (if required).

Based upon its review of the MEPA documents, the permit applications submitted to date, and the Authority's regulations, the Authority finds that the terms and conditions to be incorporated into the permit required for this Project will constitute all feasible measures to avoid damage to the environment, including consideration of the potential effects of climate change, and will minimize and mitigate such damage to the maximum extent practicable for those impacts subject to the Authority's oversight (see the appended Mitigation Table). Implementation of the mitigation measures will occur in accordance with the terms and conditions set forth in the permit.

10.5 Massachusetts Gaming Commission Proposed Section 61 Finding

Project Name:	Caesars Resort at Suffolk Downs
Project Location:	East Boston and Revere
Project Proponent:	Sterling Suffolk Racecourse, LLC
EOEA Number:	15006
Date Noticed in Monitor:	

These Findings for Caesars Resort at Suffolk Downs (EEA #15006) have been prepared in accordance with the provisions of M.G.L. c. 30, Section 61 and 301 CMR 11.00. On [DATE] the Secretary of Energy and Environmental Affairs issued a Certificate stating that the Project's Final Environmental Impact Report (FEIR), dated [DATE], adequately and properly complied with the Massachusetts Environmental Policy Act and its implementing regulations.

Caesars Resort at Suffolk Downs presents a unique opportunity to re-energize the Project area with a mixed-use urban resort casino development. The Project program includes two distinct gaming areas (referred to herein as Casino Area I and Casino Area II), up to 450 guestrooms in two hotels, a multi-purpose meeting/entertainment space, dedicated structured parking, fine dining, retail space, and sports bars as well as surface parking and a maintenance building. The Proponent proposes to construct substantial infrastructure

improvements on Route 1A in the vicinity of the Project site as an integral part of the Project, and the Project also includes a number of other transportation-related improvements.

As this Project is currently described, the following licenses will be required from the Commission:

- Category 1 Gaming License.

Based upon its review of the MEPA documents, the permit applications submitted to date, and the Commission's regulations, the Commission finds that the terms and conditions to be incorporated into the license required for this Project will constitute all feasible measures to avoid damage to the environment, including consideration of the potential effects of climate change, and will minimize and mitigate such damage to the maximum extent practicable for those impacts subject to the Commission's authority (see the appended Mitigation Table). Implementation of the mitigation measures as memorialized in the HCAs with Boston and Revere will occur in accordance with the terms and conditions set forth in the permit.

[Date]

10.6 Summary of Mitigation Measures

Mitigation measures related to the categories associated with permits the Project requires from State agencies are summarized below and in Table 10-1.

10.6.1 Transportation

The numerous transportation improvements to be constructed in connection with the Project are described in Section 5.0 (and are set forth as requirements in the HCAs [see Attachment B]).

10.6.2 Air Quality

Pollutant emissions from the Project will be reduced in a variety of ways. Stationary sources will be required to comply with applicable emission regulations promulgated for the specific sources. Diesel emergency generators will be required to meet emission performance standards as specified in 40 CFR 89 and/or 310 CMR 7.26(42). Heating boilers subject to ERP will be required to meet emissions limits specified in 310 CMR 7.26(33)(b). Sources not meeting these emission limits will require aftermarket pollution control.

Curbside vehicle idling of taxis, shuttle buses, and private vehicles will be limited to 5 minutes. Massachusetts state laws (M.G.L. Chapter 90, Section 16A and M.G.L. Chapter 90, Section 16B) and MassDEP regulations (310 CMR 7.11(1)(b)) limit vehicle idling to no more than five minutes in most cases. A vehicle may idle longer only if absolutely necessary. There are exceptions for vehicles being serviced, vehicles making deliveries that need to keep their engines running (to power refrigerators, for example), and vehicles that need to run their engines to operate accessories (such as power lifts). MassDEP provides tools for both facilities and fleets to use to discourage curbside idling.

10.6.3 Greenhouse Gas Emissions

The Proponent is committed to the following mitigation elements for the entire Resort or for individual buildings, as applicable:

- High performance building envelopes;
- Light or reflective roofs;
- High-efficiency HVAC equipment;
- 200 kW CHP in the CUP;
- approximately 2.7 MW of PV arrays;
- Energy recovery ventilation;
- Room occupancy sensors in appropriate spaces, including hotel rooms;
- High-efficiency interior lighting and reduced lighting power density where feasible;
- High-performance exterior lighting;
- Low-flow or waterless plumbing fixtures and water conservation measures;
- Energy Star appliances and electronics;

- Energy management systems;
- Recycling collection areas;
- Construction waste recycling;
- Extensive TDM program (see Section 5.9);
- Shuttle bus fleet that will be CNG-powered; and
- Electric-powered site security vehicles.

The Proponent will submit a post-construction self-certification to the MEPA Office that will identify the GHG mitigation measures incorporated into the as-built buildings. Details of the owner's implementation of operational measures will be included.

10.6.4 Wastewater

The Project is proposing all new sanitary sewer lines on the Project site, since the existing sanitary sewer line was installed in the 1930s when the site was initially developed. With Project development, a new wastewater collection system will replace the existing sewer line, thus significantly decreasing the amount of I/I conveyed to the BWSC system. The Proponent acknowledges the BWSC policies regarding offsetting flow increases with reductions in nearby I/I. The Proponent is committed to working closely with the BWSC to provide appropriate mitigation consistent with BWSC goals and policies. Furthermore, the Proponent acknowledges Boston's 4:1 mitigation requirements as well as fees associated with that requirement, and will work with BWSC to identify projects or incur the appropriate fees.

10.6.5 Water Use

Water conservation measures are incorporated into the Project design to reduce potable water demands on the BWSC water supply system. These measures include rainwater harvesting and reuse, low-flow or waterless plumbing fixtures, and public education. Relative to normal plumbing fixtures, the use of low-flow fixtures and equipment in Resort buildings is expected to reduce water use by approximately 30%, resulting in an annual water use reduction of approximately four million gallons. Proposed rainwater harvesting tanks will have a collective capacity of approximately 270,000 gallons, and rainwater harvesting activities are expected to reduce potable water demand by up to 4.5 million gallons per year. The Project will further reduce irrigation water demand by planting native and/or drought-tolerant plant species in landscaped areas; in keeping with the restorative site concepts, use of native drought-resistant plants will contribute to reducing potable water use for irrigation by approximately 50%. Collectively, Project strategies to harvest rainwater, employ low-flow and waterless technologies, and use restorative site concepts in landscaping will reduce potable water use by approximately 8.5 million gallons annually.

10.6.6 Stormwater

The Project includes installation of a stormwater management system that is being designed to meet and exceed MassDEP Stormwater Management Standards, City of Boston stormwater requirements, and City of Revere stormwater requirements. As a redevelopment project, the Project is required to improve existing conditions to the maximum extent practicable. The Project will reduce peak stormwater flows, remove a minimum of 80% of TSS from stormwater flows, and collect and infiltrate the equivalent of the one-inch storm event over the proposed impervious area. The Project will reduce impervious area by approximately 14 acres on the Project site, which is perhaps the most significant improvement to the stormwater system relative to existing conditions. In addition, the stormwater management system will incorporate water quality treatment and infiltration facilities that are not currently present on the Project site.

The Project has been designed using environmentally sensitive site design and LID techniques. This design prevents the generation of stormwater and non-point source pollution by reducing impervious surfaces, disconnecting flow paths with biofiltration swales, treating and infiltrating stormwater at bioretention basins, and protecting natural processes taking place in surrounding resource areas. Stormwater systems have been designed to model natural hydrologic features, including promoting infiltration throughout the site.

The proposed stormwater management system for the Project site includes three sizable rainwater harvesting cisterns capable of collecting up to 270,000 gallons of water, porous pavers, deep sump and hooded catch basins, infiltrating bioretention basins with sediment forebays, biofiltration swales, and proprietary water quality structures. Stormwater management is discussed in further detail in Section 9.3.

10.6.7 Construction-Period Considerations

Proper signage will direct pedestrians safely around the site and construction activities. Suffolk Construction Company will work to minimize impacts to both pedestrian and vehicular flow. As pedestrian access changes with the progression of construction, all changes will be submitted to BTD and the City of Revere prior to implementation. Fire department access as well as access to the fire hose connection will be continuously maintained at all times as shown in the attached construction phasing plans.

The Proponent will prepare a SWPPP and submit a Notice of Intent to the U.S. EPA for coverage under EPA's NPDES CGP. The SWPPP will detail methods for preventing soil erosion and pollution of downstream receiving waters due to stormwater runoff from construction zones, and will include both structural and non-structural BMPs to be used during and construction.

Construction operations at the site, including earthwork, will generate dust. All demolition and construction work will be performed in accordance with applicable sections of the MassDEP Air Pollution Control Regulations at 310 CMR 7.02 and 310 CMR 7.09. Specific construction-period air quality mitigation measures are identified in the Draft CMP provided in Attachment L. Every reasonable effort will be made to minimize the noise impact of construction activities, and specific mitigation measures are identified in the Draft CMP.

Because the construction workforce will arrive prior to peak traffic periods, these trips are not expected to impact traffic conditions. In addition, jobsite personnel will be encouraged to utilize public transportation. Personal vehicles will be allowed to park within designated areas at the Project construction site, and no construction vehicle parking will be allowed in adjacent neighborhoods. It is expected that truck traffic will average 15-20 trucks daily spread evenly throughout the day. Specific truck routes will be identified and described to BTD and the City of Revere, and will be clearly delineated on site logistics drawings. Construction contracts will include clauses restricting truck travel to BTD- and Revere-approved routes. Anti-tracking stone pads will be placed at each access point to the work area. Off-site traffic improvements will require close coordination with the cities of Boston and Revere as well as MassDOT and DCR. The construction manager will develop a construction-period traffic management plan for review and approval by the cities and state. Signage, traffic cones, drums, and other traffic control measures will be employed during construction to provide positive guidance for traffic near the work zone (see the Draft CMP in Attachment L for additional details).

10.7 Mitigation Table

Table 10-1 summarizes potential Project impacts and related mitigation measures. Costs are included in the overall Project costs.

Table 10-1 Summary of Impacts and Mitigation Measures

Subject Matter	*Impact*	*Mitigation Measure and Cost*	*Schedule*
Transportation	The Project will generate 21,434 net new average vehicle trips per weekday, and 33,038 net new average vehicle trips on Saturdays.	See Attachment B, Host Community Agreements	As described in HCAs.
Air Quality	Stationary sources and Resort-related traffic will generate regulated pollutant emissions.	Stationary sources will be required to comply with applicable emission regulations promulgated for the specific sources. Diesel emergency generators will be required to meet emission performance standards as specified in 40 CFR 89 and/or 310 CMR 7.26(42). Heating boilers subject to ERP will be required to meet emissions limits specified in 310 CMR 7.26(33)(b). Sources not meeting these emission limits will require aftermarket pollution control. Curbside vehicle idling of taxis, shuttle buses, and private vehicles will be limited to five minutes. Transportation related mitigation measures will be implemented to reduce vehicle trips and miles traveled in addition to intersection delay times.	During construction and occupancy.
Greenhouse Gas Emissions	The Proponent will incorporate all feasible measures within its control to minimize and mitigate GHG emissions associated with the Project.	The Proponent is committed to the following mitigation elements for the entire Project or for individual buildings, as applicable: ♦ High performance building envelopes; ♦ Light or reflective roofs; ♦ High-efficiency HVAC equipment; ♦ 200 kW CHP in the CUP; ♦ approximately 2.7 MW of PV arrays; ♦ Energy recovery ventilation; ♦ Room occupancy sensors in appropriate spaces, including hotel rooms; ♦ High-efficiency interior lighting and reduced lighting power density where feasible; ♦ High-performance exterior lighting; ♦ Low-flow or waterless plumbing fixtures and water conservation measures;	During construction and occupancy.

Table 10-1 Summary of Impacts and Mitigation Measures (Continued)

Subject Matter	*Impact*	*Mitigation Measure and Cost*	*Schedule*
Greenhouse Gas Emissions (continued)		♦ Energy Star appliances and electronics; ♦ Energy management systems; ♦ Recycling collection areas; ♦ Construction waste recycling; ♦ Extensive TDM program (see Section 5.9); ♦ Shuttle bus fleet that will be CNG-powered; and ♦ Electric-powered site security vehicles. The Proponent will submit a self-certification to the MEPA Office at the completion of construction that will identify the incorporated GHG mitigation measures and illustrate the degree of GHG reductions from the Baseline case.	
Wastewater	321,834 gallons per day	The Proponent will provide infiltration and inflow mitigation equivalent to four times the amount of wastewater generated, consistent with MassDEP and BWSC standards.	During construction and occupancy.
Water Use	354,017 gallons per day	The Proponent will install water conservation measures, including use of low-flow plumbing fixtures, water-conserving landscaping, and rainwater harvesting tanks to reduce potable water demand consumption.	During construction and occupancy.
Stormwater Management	The Project will decrease the amount of impervious area on site and will significantly improve stormwater management. The Project will have no adverse impacts related to stormwater.	The Project will significantly improve the quality of water leaving the site by installing a stormwater management system that will be fully compliant with MassDEP Stormwater Management Guidelines. This system will include a mix of conventional and LID BMPs. The reduction in impervious surface on the site will reduce the rate and volume of stormwater leaving the site.	During construction and occupancy
Construction-Period	Temporary impacts on traffic, air quality, noise, water quality	Public safety will be maintained throughout the construction period through techniques such as: ♦ Barricades, defined temporary walkways, and signage; ♦ Designation of a truck route for access to the Project site; ♦ Construction personnel will not be permitted to park personal vehicles in the adjacent neighborhood; ♦ Implementation of air quality and dust control measures such as wetting agents, truck covers, use of ultra low-sulfur diesel fuel, vehicle tracking pads, and street cleaning;	During construction.

Table 10-1 Summary of Impacts and Mitigation Measures (Continued)

Subject Matter	*Impact*	*Mitigation Measure and Cost*	*Schedule*
Construction-Period (cont'd)	Temporary impacts on traffic, air quality, noise, water quality	♦ Implementation of noise control measures, include screenings, adherence to schedule restrictions, and use of mufflers; ♦ Installation of construction-period erosion and sediment controls; and ♦ Use of solid waste reduction measures including recycling, when possible. A Stormwater Pollution Prevention Plan will detail methods for preventing soil erosion and pollution of downstream receiving waters, using both structural an non-structural BMPs. Construction-related impacts to traffic will be minimized by having workers arrive on site during non-peak hours, designating particular truck routes in conjunction with the Cities of Boston and Revere, and prohibiting construction vehicle parking in adjacent neighborhoods. Methods to minimize dust generation will include: ♦ Use of appropriately designed construction entrances and wheel wash facilities to prevent off-site migration of soils; ♦ Mechanical street sweeping of construction areas and surrounding streets and sidewalks; ♦ Encapsulation of demolition sites as necessary where hazardous materials such as asbestos or lead paint are identified; ♦ Removal of demolition and construction waste in covered or enclosed trailers; ♦ Wetting of exposed soils and stockpiles to prevent dust generation; ♦ Minimizing stockpiling of materials on site; ♦ Turning off construction equipment when not in use and minimizing idling times; ♦ Minimizing the storage of demolition and construction wastes on site; and ♦ Minimizing the duration that soils are left exposed. ♦ of highest ambient noise levels, and to maintain relatively uniform noise levels. ♦ Turning off idle equipment.	During construction.

Table 10-1 Summary of Impacts and Mitigation Measures (Continued)

Subject Matter	*Impact*	*Mitigation Measure and Cost*	*Schedule*
Construction-Period (cont'd)		Measures to minimize noise generation will include: ♦ Scheduling work during daytime hours. If nighttime or Sunday work is proposed, it will be coordinated with BTD and the City of Revere. ♦ Using appropriate mufflers on all equipment and providing ongoing maintenance of intake and exhaust mufflers. ♦ Maintaining muffler enclosures on continuously operating equipment, such as air compressors and welding generators. ♦ Replacing specific construction operations by less noisy ones where feasible and practical. ♦ Selecting the quietest practicable equipment (e.g., electric instead of diesel-powered equipment). ♦ Selecting equipment operations to keep average noise levels low, to synchronize the noisiest activities with times	
Massachusetts Gaming Commission		See Attachment B, Host Community Agreements	As described in HCAs.

Section 11.0

Response to Comments

11.0 RESPONSE TO COMMENTS

The DEIR/EPNF is structured in response to the EEA Secretary's Certificate on the ENF. A copy of the Certificate is included in this section.

In addition to addressing the scope in the Certificate, this section responds to comment letters submitted on the ENF. Each letter has been assigned an abbreviation, as listed in Table 11-1. The comment letters are reprinted in this section, and specific comments within each letter are noted in the margin with this abbreviation and sequential numbering. Following the letter is a listing of the comments accompanied by a response to each.

Table 11-1 Certificate and Comment Letters

Commenter	*Abbreviation*

April 5, 2013

CERTIFICATE OF THE SECRETARY OF ENERGY AND ENVIRONMENTAL AFFAIRS
ON THE
ENVIRONMENTAL NOTIFICATION FORM

PROJECT NAME	: Caesars Resort at Suffolk Downs
PROJECT MUNICIPALITY	: Boston and Revere
PROJECT WATERSHED	: Boston Harbor
EEA NUMBER	: 15006
PROJECT PROPONENT	: Sterling Suffolk Racecourse, LLC
DATE NOTICED IN MONITOR	: February 6, 2013

Pursuant to the Massachusetts Environmental Policy Act (MEPA) (M.G. L. c. 30, ss. 61-62I) and Section 11.03 of the MEPA regulations (301 CMR 11.00), I hereby determine that this project **requires** the preparation of a Mandatory Environmental Impact Report (EIR).

Project Description

As described in the Environmental Notification Form (ENF), the project consists of redevelopment of the Suffolk Downs racetrack as a destination resort casino. The Proponent is seeking a Category 1 gaming license pursuant to Chapter 194 of the Acts of 2011: An Act Establishing Expanded Gaming in the Commonwealth and M.G.L. Chapter 23K, Section 19, as amended by Section 16 of the Expanded Gaming Act, which authorizes the Massachusetts Gaming Commission (MGC) to license three casinos. The Act identifies three regions of the state (Region A, Region B and Region C) and authorizes MGC to permit one casino in each region. This project is the first project in the Central Boston Region to undergo MEPA review.

The proposed resort casino includes the following elements:

- two distinct gaming areas providing 200,000 square feet of gaming space containing 4,000-5,000 slot machines, 200 table games and a World Series of Poker™ room;
- two hotels providing 450 rooms;
- meeting/entertainment space;
- approximately 16 restaurants including fine dining concepts, casual dining and a marketplace;
- approximately 30,000 sf of retail;
- a seven-story parking garage with 2,600 spaces, valet parking for 450 (located below grade under Casino Area II) and 2,100 surface parking spaces; and
- a Central Utility Plant.

The project will include a combination of new construction, redevelopment of existing buildings, retention of existing infrastructure and facilities, and demolition. The ENF identifies continued operation of the Suffolk Downs thoroughbred racetrack facility as an important long-term development goal and indicates that gaming and racing components will be operated jointly. New construction consists of a 470,965 square foot (sf) building that will include Casino Area II and a 300-room hotel (Hotel II), a 110,000 sf 150-room hotel (Hotel I), a glass pavilion to connect the casino areas, the parking garage, and the utility plant. Hotel I is identified as a 135-foot tall building and Hotel II is identified as a 166-foot tall building. The Suffolk Downs Grandstand Building will be redeveloped to support Casino Area I on the first floor of the building and the existing clubhouse will be renovated. To support the racing facility, the existing horse barn area will be retained and the barns may be repaired or replaced as necessary. An existing office building, maintenance building, paved driveways, parking lots, sidewalks and some utilities are slated for demolition.

The project includes construction of access drives, extensive landscaping, construction of a new stormwater management system and other associated infrastructure. Vehicular access to and circulation within the site is proposed through a reconstructed Tomasello Drive, a privately-owned roadway that extends from Route 1A to Route 145. Primary access is proposed at its intersection with Route 1A. Secondary access will continue from Route 145 to Tomasello Drive and from Furlong Drive (a public way that extends through the retail development at the northwest corner of the site) to Tomasello Drive.

The project schedule is dependent upon the MGC schedule for reviewing projects and issuing licenses. The ENF indicates that Casino Area I will be completed within approximately 15 months from construction commencement and the remainder of the project will be completed within 30 months. It indicates that proposed off-site improvements may take up to two years to complete.

Project Site

The 161-acre site is located within a densely developed urban area in East Boston (116 acres) and Revere (45 acres) and in close proximity to transit and the regional traffic network. It is bordered to the west by Route 1A and fuel storage tank farms; to the northwest by a shopping plaza; to the north by Route 145 (Revere Beach Parkway/Winthrop Avenue) and the Crescent Heights neighborhood; to the northeast and east by the MBTA Blue Line tracks, Bennington Street, the Beachmont neighborhood and Belle Isle Marsh; and, to the south by Waldemar Avenue and the Orient Heights neighborhood.

The site includes access drives, a grandstand and clubhouse buildings, a one-mile racetrack for thoroughbred racing, stables to accommodate approximately 1,000 horses, surface parking and other associated infrastructure. The site contains approximately 405,480 sf of buildings (not including the horse barns), the tallest of which is 88 feet high. Two previous projects associated with the site have undergone MEPA review. These include the Sales Creek Culvert Emergency Repairs (EEA#13437) and the Suffolk Downs Stabling Area and Racecourse Stormwater Improvements (EEA #14747). The latter consisted of a stormwater separation project to secure an Individual NPDES Permit for the Concentrated Animal Feeding Operations (CAFO).

A portion of the project site is located within the Rumney Marshes Area of Critical Environmental Concern (ACEC), including Sales Creek which flows through the site and discharges into the Belle Isle Inlet. The Belle Isle Marsh, located to the southeast of the project site, is a 241-acre marsh that includes a 28-acre landscaped park owned by the Department of Conservation and Recreation (DCR). On-site wetland resource areas include Bordering Land Subject to Flooding (BLSF),[1] Riverfront Area, Bordering Vegetated Wetlands (BVW), Inland Bank, and Land Under Water Bodies and Waterways (LUW). In addition, the project site includes landlocked, filled tidelands.

According to the Massachusetts Historical Commission (MHC), the Suffolk Downs Clubhouse, Grandstand and Racetrack (BOS.209) are included in the MHC Inventory of Historic and Archaeological Assets of the Commonwealth and may be eligible for listing in the State and National Registers of Historic Places.

Environmental Impacts

Potential environmental impacts are associated with land alteration, alteration of wetland resource areas (including 480,000 sf of BLSF, 1,100 sf of RA and 40,000 sf of LSCSF), generation of an additional 24,600 unadjusted average daily trips (adt) for a total of 40,500 unadjusted adt,[2] an additional 379,910 gallons per day (gpd) of water use for a total of 435,810 gpd, an additional 307,080 gpd of wastewater generation for a total of 473,100 gpd of wastewater, construction of additional water and sewer infrastructure, and generation of Greenhouse Gas (GHG) emissions.

Measures to avoid, minimize and mitigate environmental impacts include, but are not limited to, redevelopment of an existing site in close proximity to transit, a nine-acre reduction in impervious surfaces, roadway and signal improvements (including off-site improvements), implementation of a Transportation Demand Management (TDM) program to limit single-occupancy-vehicle (SOV) trips, improved bicycle and pedestrian access, construction of a new stormwater management system[3] and continued maintenance of the existing stormwater system associated with the CAFO. In addition, the project will include measures to reduce GHG emissions including use of high efficiency chillers, condensing boilers, water-and air-side economizers, heat recovery, high-efficiency lighting and controls, and water conserving plumbing fixtures. The project will be designed to be certifiable by the U.S. Green

[1] The ENF indicates that the 100-year floodplain could be classified as BLSF or Land Subject to Coastal Storm Flowage (LSCSF). It indicates that BLSF was selected for planning purposes as a conservative approach because BLSF requires compensatory flood control whereas there are no performance standards for LSCSF.

[2] Based on a week of Automatic Traffic Recorder (ATR) counts performed on each access roadway in July 2012 which may include pass-through trips not destined for the racetrack facility.

[3] Stormwater management systems will be installed to support new development and redevelopment. No changes are proposed at this time to the stormwater system associated with the CAFO.

Building Council's (GBC) Leadership in Energy and Environmental Design (LEED) at the Gold level.

Permits and Jurisdiction

The project is subject to MEPA review and requires the preparation of a Mandatory EIR pursuant to 301 CMR 11.03 (1)(a)(1) and (6)(a)(6) because it requires a State Agency Action and it will include direct alteration of 50 or more acres of land and generation of 3,000 or adt on roadways providing access to a single location. The project requires a Category 1 Gaming License from the MGC, a Vehicular Access Permit from the Massachusetts Department of Transportation (MassDOT), a Construction and Access Permit from DCR, and Airspace Review by the Massachusetts Aeronautics Commission (MAC). It requires a Sewer Use Discharge Permit (or waiver) from the Massachusetts Water Resources Authority (MWRA) and it may require a 8(M) Permit from MWRA. It requires a Sewer Connection Permit from the Massachusetts Department of Environmental Protection (MassDEP) and it may also require an Air Plan Approval from MassDEP. The project may require Federal Consistency Review by Coastal Zone Management (CZM). The project is subject to the May 5, 2010 MEPA GHG Emission Policy and Protocol (GHG Policy).

It will require multiple permits and approvals from the City of Boston, including a Planned Development Plan and/or Zoning Amendment Approval and Large Project Review pursuant to Article 80B of the Boston Zoning Code, approval of a Construction Management Plan (CMP) and a Transportation Access Plan Agreement (TAPA), and an Order of Conditions from the Boston Conservation Commission (or a Superseding Order of Conditions (SOC) from MassDEP in the event a local Order is appealed).

It may require a Special Permit/Overlay District Approval from the Revere City Council, it will require Site Plan Review and it will require an Order of Conditions from the Revere Conservation Commission (or a Superseding Order of Conditions (SOC) from MassDEP in the event a local Order is appealed).

As part of the gaming process, the Proponent will develop Host Community Agreements with the City of Boston and the City of Revere and the agreements will be subject to a local referendum in each community. In addition, the ENF indicates that the Proponent will enter into Surrounding Community Agreements with Chelsea and Winthrop.

Federal permits appear to be limited to a National Pollutant Discharge Elimination System (NPDES) Construction General Permit. In addition, the project will require a Part 77 Airspace Review from the Federal Aviation Administration (FAA).

Because the Proponent is not requesting State Financial Assistance, MEPA jurisdiction is limited to the subject matter of required or potentially required permits; however, the subject matter of the Gaming License confers broad scope jurisdiction and extends to all aspects of the project that may cause Damage to the Environment, as defined by the MEPA regulations.

Comments on the ENF

Comments from State Agencies, municipalities, and some residents highlight the Proponent's willingness to consult with them and to provide useful information regarding the development of the project and project design. Many comments are very supportive of the proposed project and opportunities for improving environmental site conditions. Other comments express significant concern with the addition of a casino resort at Suffolk Downs, as well as associated environmental impacts. Several comments received on the ENF focus on non-environmental or non-jurisdictional impacts with regard to the MEPA process and/or suggest that adequate information was not provided in the ENF. MEPA is an environmental impact disclosure process; MEPA does not approve or deny a project, but serves as a public forum for a project proponent to identify potential project-related impacts and propose mitigation measures to offset these potential impacts prior to the separate State Agency individual permitting processes. A key purpose of MEPA is to "assist each Agency in using (in addition to applying any other applicable statutory and regulatory standards and requirements) all feasible means to avoid Damage to the Environment or, to the extent Damage to the Environment cannot be avoided, to minimize and mitigate Damage to the Environment to the maximum extent practicable" (301 CMR 11.01(1)(a)).

The majority of comments, whether supportive of the proposed use or not, identify the challenge posed by existing congestion of the local and regional roadway system and the additional traffic generated by the project. Comments on the ENF identify other environmental concerns as well as societal impacts associated with gaming. I have received comment letters from elected officials, municipal officials, State and regional agencies, from environmental advocacy groups, from businesses, and from residents, including abutters. The MEPA process has provided, and will continue to provide, a valuable forum for public input; however, the Scope is limited to identification and analysis of environmental impacts associated with the proposed development. The MEPA process occurs early in the design process to identify key environmental concerns and challenges, prior to final project design. It does not generally address issues at a level of detail commensurate with those often reviewed at the local level. Information provided in the ENF regarding the project, project elements, potential impacts and potential mitigation supports the development of a Scope for this project and in many instances provides a greater level of detail than is typically required.

While several of the issues identified in comment letters are beyond the scope of review under MEPA, the Scope issued today ensures that the environmental impacts of the proposed project will be thoroughly disclosed and evaluated and that thoughtful mitigation measures will continue to be considered and evaluated by the Proponent. The DEIR will provide a detailed project description and additional information regarding the project design, alternatives, potential impacts and alternative mitigation measures and it will provide another opportunity for State Agencies and the public to provide input on the project and its environmental impacts.

SCOPE

General

The Draft Environmental Impact Report (EIR) should follow Section 11.07 of the MEPA regulations for outline and content, as modified by this Scope.

Project Description and Permitting

The DEIR should include a detailed description of the proposed project and identify any changes to the project since the filing of the ENF. It should include all project elements, including racetrack operations, a description of potential changes to the horse barns area, and associated maintenance. It should include updated site plans for existing and proposed conditions at a legible scale. Plans should clearly identify access roadways and internal driveways, proposed structures, surface and structured parking, infrastructure (e.g. drainage, wastewater, water supply) wetland resource areas, and adjacent land uses. The DEIR should identify all State permits and approvals required for the project and identify how the project will be developed consistent with associated regulatory standards and requirements. In addition, it should describe project phasing and identify how permitting will be addressed within the context of this phasing. **MEPA 01** **MEPA 02**

The DEIR should identify the project's consistency with EO 384, the Commonwealth's Sustainable Development Principles, and regional and local land use plans, including the East Boston Master Plan (April 2000), the City of Revere Massachusetts, FY 2010-2015 Strategic Plan, and the Boston Region Metropolitan Planning Organization (MPO) Journey to 2030 (September 27, 2007). **MEPA 03**

To provide context for the project review, the DEIR should provide a summary of the relevant sections of the Expanded Gaming Act and associated regulations, the project application process, and the development of Host and Community agreements. **MEPA 04**

Alternatives Analysis

The project purpose is defined as the development of a resort casino proposed to be consistent with the Expanded Gaming Act, which was developed to create new jobs and spur economic development. The DEIR should identify elements of the project that are required by the legislation and/or regulations and the extent to which the size and associated impacts of the project are driven by gaming requirements, such as the minimum capital investment for a category 1 license. **MEPA 05**

The ENF references a 2006 study of the environmental impacts associated with a mixed use development scenario consisting of 3,236 residential units, and 698,305 sf of retail and restaurant uses. This study is used to provide a general comparison of environmental impacts. While this scenario may be useful to identify the maximum envelope of impacts associated with a large mixed-use development, it is unclear whether this is a fair comparison. For instance, it indicates that the scenario does not retain any significant open space and would include alterations to BVW. The DEIR should provide a more realistic mixed-use development scenario for the site to support a better understanding of the relative impacts of a resort casino compared to a mixed use development. I note that Senator Petruccelli, State **MEPA 06**

Rep Carlo Basile and Boston City Councilor Salvatore LaMattina request additional analysis of alternatives to provide the community with a better understanding of relative impacts.

The DEIR should identify each alternative's impacts on land alteration, creation of impervious area, impacts to wetland resource areas, public benefits associated with landlocked tidelands, traffic generation, parking, water use, and wastewater. This comparison should be provided in a tabular format with supporting narrative and conceptual site plans. **MEPA 07**

In addition, the Traffic and Transportation Section of the Scope identifies additional alternatives analysis that will be required for development of roadway improvements and mitigation.

Greenhouse Gas Emissions

The ENF identifies a strong commitment to sustainable development, including LEED certification of the project at the Gold level. It describes the Caesar's Resorts commitment to environmental sustainability through its CodeGreen program. The project offers a wide variety of opportunities to introduce innovative programs and establish the resort as a leader in environmental sustainability; its operating characteristics – including continuous operations, designs that include large open gaming rooms with varying levels of occupancy over the course of a day, and hotels with large hot water and standby loads – provide a strong incentive for doing so. The ENF indicates that the Proponent will consult with environmental and energy programs, including the Massachusetts Clean Energy Center, MassDEP and the Department of Energy Resources (DOER) to identify opportunities and technical assistance resources for design and implementation of projects or pilot programs.

This project is subject to review under the May 5, 2010 MEPA GHG Policy and it is subject to the Massachusetts Stretch Energy Code (Stretch Code) adopted by the City of Boston. The DEIR shall include an analysis of GHG emissions and mitigation measures in accordance with the standard requirements of this Policy. The analysis should quantify the direct and indirect GHG emissions associated with the project's energy use and transportation-related emissions. Direct emissions include on-site stationary sources, which typically emit GHGs by burning fossil fuel for heat, hot water, steam and other processes. Indirect emissions result from the consumption of energy, such as electricity, that is generated off-site by burning of fossil fuels, and from emissions associated with vehicle use by employees, vendors, customers and others. The DEIR should identify and commit to mitigation measures to reduce GHG emissions. **MEPA 08**

The DEIR should include a GHG emissions analysis that calculates and compares GHG emissions associated with: 1) a Massachusetts Building Code-compliant baseline (based on the Massachusetts Building Code 8th Edition (Chapter 780 CMR 13.00) which has been amended to adopt and integrate either the current version of the International Energy Conservation Code (IECC) or ASHRAE 90.7-2007; 2) a Preferred Alternative that includes energy efficiency design measures to achieve compliance with the Stretch Code. The Policy requires Proponents to use energy modeling software to quantify projected energy usage from stationary sources and energy consumption and modeling should be developed in accordance with ASHRAE 90.1–2007 Appendix G. **MEPA 09**

The GHG analysis should clearly demonstrate consistency with the objectives of MEPA review, one of which is to document the means by which Damage to the Environment can be avoided,

minimized and mitigated to the maximum extent feasible. The Proponent should identify the model used to analyze GHG emissions, clearly state modeling assumptions, explicitly note which GHG reduction measures have been modeled, and identify whether certain building design or operational GHG reduction measures will be mandated by the Proponent to future occupants or merely encouraged for adoption and implementation. The DEIR should include the modeling printout for each alternative and emission tables that compare base case emissions in tons per year (tpy) with the preferred alternative showing the anticipated reduction in tpy and percentage by emissions source (direct, indirect and transportation). Other tables and graphs may also be included to convey the GHG emissions and potential reductions associated with various mitigation measures as necessary. **MEPA 10**

The ENF indicates that, at a minimum, the project will incorporate the following measures into the buildings to reduce GHG emissions: high efficiency chillers, condensing boilers, water- and air-side economizers, heat recovery, high-efficiency lighting and controls, and water conserving plumbing fixtures. Comments from MassDEP and DOER provide additional guidance regarding mitigation measures that should be explored as part of the GHG analysis, as well as resources to assist in preparation of the analysis. In addition, I note that many other commenters, including the City of Boston Environment Department, the Metropolitan Area Planning Council (MAPC), MassAudubon and other advocacy organizations identify the design of a highly efficient, low energy use project as a priority and identify additional measures and programs for analysis.

The ENF indicates that the DEIR will should present an evaluation of mitigation measures identified in the GHG Policy Appendix. The feasibility of each of the mitigation measures outlined below should be assessed for each of the major project elements, and if feasible, GHG emissions reduction potential associated with major mitigation elements should be to evaluated to assess the relative benefits of each measure. **MEPA 11**

- Minimize energy use through building orientation and evaluate its impacts on energy usage, including solar gain, day-lighting and viability of solar photovoltaic (PV) systems;
- Use of high-albedo roofing materials;
- Install high-efficiency HVAC systems and adequate numbers of thermal zones to support temperature controls;
- Reduce energy use through peak shaving or load shifting strategies;
- Maximize interior day-lighting through floor-plates, increased building perimeter and use of skylights, clerestories and light wells;
- Incorporate window glazing to balance and optimize daylighting, heat loss and solar heat gain performance;
- Incorporate roof and wall insulation to minimize heat loss and minimize uncontrolled infiltration through the building envelope;
- Incorporate lighting motion sensors, climate control and building energy management systems;
- Install energy efficient lighting, both exterior and interior;
- Evaluate additional measures to reduce project plug loads, including the use of more efficient equipment (such as Energy Star), consider energy consumption as a factor in the selection of special equipment, such as slot machines, and consider power management techniques; and,
- Install water source heat pumps (hotel rooms only).

In addition to the typical measures identified above, the ENF includes a commitment to analyze combined heat and power (CHP), on-site photovoltaic (PV) systems for electricity and/or hot water (including consideration of PV on the parking structure) and anaerobic digestion for management of organic waste and development of renewable energy. I applaud the Proponent's commitment to thoroughly evaluate these alternatives and note the following:

- The CHP feasibility analysis should consider state incentives to support CHP as well as information provided by MassDEP regarding the use of CHP at a significant number of casinos and large hotels. The feasibility analysis should include consideration of one of the major benefits of a CHP system – the ability to produce off-grid power. **MEPA 12**
- Evaluation of PV systmes should consider state incentives to promote the use of PV systems (Commonwealth Solar II and Commonwealth Solar Stimulus). At a minimum, buildings should be oriented to the south to maximize solar exposure and, if the analysis demonstrates that such systems are presently infeasible, they should be "solar ready" to facilitate future installation of PV systems. **MEPA 13**
- The Proponent should consult with MassDEP regarding the amendment of its regulations to build capacity for organics management and associated permitting requirements. **MEPA 14**

The DEIR should explain, in reasonable detail, why certain measures, which could provide significant GHG reductions, were not selected - either because it is not applicable to the project or is considered technically or financially infeasible. As noted by MassDEP, the Proponent should also consider transportation demand management (TDM) measures (which are addressed in more detail within the following Traffic and Transportation Section) and adoption of additional sustainable design measures for which GHG reductions cannot be easily quantified, such as recycling efforts and water conservation measures, that can be incorporated into the project. Additional GHG reductions can be achieved through effective materials management during the design, construction, and operations phases of the project. These measures will be considered when evaluating whether the project can mitigate its GHG emission to the greatest extent practicable. **MEPA 15**

Additional water demand and wastewater generation associated with the project exceeds 300,000 gpd. Consistent with the GHG Policy, the DEIR should include an analysis of potential GHG emissions related to the treatment and conveyance of wastewater or withdrawal, treatment and conveyance of potable and/or non-potable water. To assist in calculation of these potential GHG emissions, the MEPA office and MassDEP have provided average energy use data for treatment facilities, including those located within an MWRA community, which are posted on the MEPA website. **MEPA 16**

The project may include leasing of space to tenants and, therefore, certain energy efficiency measures may require a level of design that will be deferred to the tenants' selection or which the developer may be less willing to commit to in advance because all the energy savings may inure to the tenants' benefit depending on the lease arrangements. While I encourage the Proponent to adopt those GHG reduction measures that are integrated into the building's core, shell and infrastructure, some measures may be transient or dependent on operational procedures implemented by the future occupant. In those instances, the Proponent should consider reasonable measures to educate and create incentives for the tenants to adopt energy efficiency/renewable generation measures. The DEIR should address the Proponent's commitment to providing energy efficiency consulting services and information and/or developing a tenant manual that requires or strongly supports GHG reduction measures. As an example **MEPA 17**

of such a document, I direct the Proponent to the New Patriots Stadium and Public Infrastructure Project (EEA No. 12037) Third Notice of Project Change and the associated Secretary's Certificate issued on April 17, 2009.

The DEIR should identify whether the project will include fleet vehicles. For the purposes of the GHG Policy, fleet vehicles are generally considered to be a source of direct GHG emissions from vehicles used by a project proponent in the everyday operation of a facility. In this case, these may include shuttle buses for employees and patrons, landscaping or catering vehicles, etc. The Proponent should consult the Policy for further direction on how to estimate direct mobile source GHG emissions and contact the MEPA office to discuss appropriate assumptions and methodology prior to conducting the analysis. **MEPA 18**

The Proponent should refer to the Policy for additional guidance on the GHG analysis. MEPA, MassDEP and DOER staff are available to assist with these efforts and I encourage the Proponent to consult with them regarding the analysis prior to submission of the DEIR. The DEIR should include a commitment to provide a self-certification to the MEPA Office at the completion of each building or group of buildings. It should be signed by an appropriate professional (e.g. engineer, architect, transportation planner, general contractor) indicating that all of the GHG mitigation measures, or equivalent measures that are designed to collectively achieve identified reductions in stationary source GHG emission and transportation-related measures, have been incorporated into the project. **MEPA 19**

Adaptation

A large portion of the site is located within a mapped 100-year floodplain and the project is located within ½ mile of the coastline. The project must be designed to comply with Massachusetts State Building Code requirements for structures within the floodplain and local requirements. Current rates of sea level rise, as well as projections for accelerated trends, pose significant threats to coastal development and resources, potentially increasing the height of storm surges and associated coastal flooding frequencies. The ENF indicates preliminary consideration of this issue and identifies hwo the project is designed to address potential impacts. Comments on the project, including comments from CZM highlight the importance of incorporating consideration of sea level rise and the potential for more frequent and intense storms into the project design. Development of adaptation measures should be guided by comments from CZM, including use of sea level rise scenarios identified in the Massachusetts Climate Change Adaptation Report. **MEPA 20**

Because the resort is designed to serve a significant numbers of patrons and is located in an area that could be directly affected by more severe storms and increased flooding, the Proponent should consider measures to generate on-site power in the event of disruptions in service to the electrical grid. In addition to providing energy more efficiently, a CHP system can continue to supply off-grid power, heat and cooling during a power outage which could benefit the facility as well as the larger community. **MEPA 21**

Traffic and Transportation

The ENF indicates that the DEIR will include a comprehensive transportation access and mitigation plan that will go beyond mitigating traffic impacts associated with the project, and will identify opportunities for addressing long-standing issues of local and regional concern. The Proponent,

and many commentors, including MassDOT, the City of Boston and MAPC identify the opportunity to develop a comprehensive multimodal access and mitigation plan.

The project abuts Route 1A which is a major commuter route and provides connections to downtown Boston, the regional highway network and to points north of Boston. The site is adjacent to the MBTA Blue Line and the Blue Line Suffolk Downs Station and Beachmont Station are located within walking distance of the site. In addition, several MBTA bus routes operate in and serve the area. Several designated bicycle routes provide connections between adjacent neighborhoods and direct pedestrian connections can be provided to the Orients Height neighborhood and other East Boston neighborhoods. Previous studies have identified significant congestion in the Route 1A corridor and, in particular at the Boardman Street intersection, continuing north on Route 60 through Revere and to Route 1. This congestion impacts daily commuters and affects local access to East Boston, Revere and Winthrop.

The project, including continued operation of the racetrack, has the potential to generate 40,500 unadjusted adt. The project requires a Vehicular Access Permit from MassDOT and a Construction and Access Permit from DCR. Development of an effective transportation access and mitigation plan is critical to avoid potentially significant impacts to the regional transportation system and state roadways. Project planning should place equal emphasis on roadway improvements and TDM measures and pursue creative solutions to encourage both patrons and employees to use alternative, less-polluting transportation. MassDOT provided detailed and extensive comments on the project and analysis required to assess impacts impacts and develop adequate mitigation. I hereby incorporate by reference the March 26, 2013 letter from MassDOT into the Scope. All issues identified in this letter should be addressed in the DEIR.

Traffic Study

To assess potential traffic impacts and develop effective mitigation, the ENF indicates that the proponent will conduct a traffic study consistent with the EEA/Massachusetts Department of Transportation (MassDOT) Guidelines for EIR/Environmental Impact Statement (EIS) Traffic Impact Assessment. The ENF identifies how the transportation study will be developed consistent with these Guidelines. It identifies elements that will be included in the transportation study and identifies strategies for addressing particular issues, such as trip generation estimates and mode splits.

The DEIR should present capacity analyses and a summary of average and 95th percentile vehicle queues for each intersection within the study area. The DEIR should also present a merge and diverge for each ramp junction and weaving analysis for all the interchanges located in the study area. Any proposed traffic signals must include a signal warrant analysis conducted according to the Manual of Uniform Traffic Control Devices (MUCTCD). The results of this analysis should be provided in a tabular format that identifies Existing, Future No-Build and Future Build Conditions for all peak hour conditions. Analysis should use a 10-year horizon (2022) for the traffic study and a 20-year horizon for analysis of proposed infrastructure improvements. **MEPA 22**

The ENF includes a proposed Study Area (page 3-11, Figure 3-1) for the traffic analysis. It includes the following locations within the Cities of Revere, Chelsea and Boston:

- Route 1A at Suffolk Downs (Tomasello Drive)
- Route 1A at Furlong Drive
- Route 145 (Winthrop Avenue) at Route 1A southbound on-ramp
- Route 145 (Winthrop Avenue) at North Shore Road
- Route 145 (Winthrop Avenue) at Suffolk Downs (Tomasello Drive)
- Bennington Street/State Road at Winthrop Avenue
- Bennington Street at Saratoga Street
- Boardman Street at Route 1A
- Route 145 (Winthrop Avenue) at Revere Beach Parkway (Route 16)/Harris Street
- Route 60 (American Legion Highway) at Bell Circle
- Route 1A (Beach Street) at Bell Circle
- Route 16 and Route 1A at Bell Circle
- Beach Street at Bell Circle
- Ocean Avenue at State Road/Revere Beach Parkway
- Eliot Circle
- Route 1A at Jug Handle
- Bennington Street at Neptune Road
- Neptune Road at Route 1A northbound off-ramp
- Butler Circle
- Revere Street at Route 60
- Brown Circle
- Copeland Circle
- Route 1/Route 16 Interchange
- Route 16 (Revere Beach Parkway) at Garfield Avenue/Webster Avenue
- Route 1A northbound at Waldemar Avenue

The ENF indicates that the study area may be expanded based on requests by MassDOT, DCR and/or municipalities. Comments from MassDOT, MBTA, and DCR recommend that the following locations be incorporated into the study area: **MEPA 23**

- Route 60/Charger Street
- Route 60/Sigourney Street
- Route 1/Copeland Circle interchange (including the rotary and adjacent segments)
- Route 1A/Wonderland MBTA Station Driveway
- Route 1A/Revere Street (signalized intersection)

In addition, MassDOT requests that a roadway segment analysis, prepared in accordance with the Highway Capacity Manual (HCM), be provided for the three harbor tunnels (Ted Williams Tunnel, Callahan Tunnel, and Sumner Tunnel) to identify daily volumes and peak characteristics.

Comments from BTD and the Revere Planning and Community Development Department request that the following locations be incorporated into the study area:

- Route 1A/Curtis Street
- Saratoga Street/Neptune Avenue
- Bremen Street/Neptune Road

- Bennington Street/Crescent Avenue

The ENF identifies traffic data that was collected to support evaluation of existing traffic operations, including patterns of traffic flow and peak periods. The program includes Automatic Traffic Recorder (ATR) counts and Turning Movement Counts (TMCs) collected in 2010 and 2012. The Proponent should consult with MassDOT regarding use of ATR and TMC to measure existing volumes, and whether additional and/or more recent counts are required for the study. In particular, the study should include the most recent data available for the Ted Williams Tunnel, Sumner Tunnel and Callahan Tunnel. **MEPA 24**

The study should evaluate existing conditions for transit, pedestrian and bicycle access, including an inventory of existing transit service, existing pedestrian access routes to the site, and an inventory of the existing bicycle network in the area. It should identify constraints that limit transit, walking and bicycle trips. It should include ridership estimates for the MBTA Suffolk Downs and Beachmont Stations and pedestrian and bicycle volumes. **MEPA 25**

As noted in the ENF and in comment letters, the Institute of Transportation Engineers (ITE) Trip Generation manual does not provide guidance for the proposed land use. Trip generation projections will be based on research of data for other comparable projects and information provided by the Proponent including data for existing gambling venues and projected data for its proposed operations at Suffolk Downs. Comments from MassDOT note that data from similar facilities will be of limited use because they are not typically located in close proximity to transit options. The Proponent should consult with the MassDOT Office of Transportation Planning and the MBTA Service Planning Department to develop appropriate and reasonable travel demand and trip generation characteristics. **MEPA 26**

Trips will be generated from a wide geographic range, including neighboring states. Trips will be generated over a 24-hour period, seven days a week, although more than half of the weekly gaming activity will occur on Friday, Saturday and Sunday. MassDOT requests that a temporal distribution of traffic over a full one-week period be provided, to support identification of the peak hours of casino traffic and most critical peak analysis periods resulting from existing roadway volumes and project site trips. Daily and peak hour trip projections by mode should be presented for patrons and employees separately and combined. Modeling and assumptions to determine the origin-destination patterns of trips should be clearly presented. **MEPA 27**

The ENF indicates that more than half of gaming activity will occur on Fridays, Saturdays and Sundays and projects that the peak traffic levels will occur after the weekday pm peak and the Saturday afternoon peak. Several commentors identify the importance of considering the potential for overlapping peak periods with other major traffic generators in the area (e.g. Logan Airport, general traffic/tunnel or beach traffic on Saturdays in May and June). In particular, MassDOT identifies a concern that peak periods for general/tunnel traffic, Logan Airport traffic and the casino could overlap and result in an extended peak period of congestion in the tunnels. MassDOT indicates that the study should identify the worst combination of projected project traffic and existing roadway volumes to determine the critical peak hours for analysis on Fridays and Saturdays. **MEPA 28**

Roadway and Signalization Improvements

The ENF provides preliminary concepts for on-site vehicular access and for off-site roadway, traffic and safety improvements that will be developed in consultation with MassDOT, affected municipalities and, where appropriate, with DCR. It identifies improvements to Tomasello Dive and its intersections with Route 1A, Furlong Drive and Route 145 (Winthrop Avenue). It identifies conceptual alternatives along the Route 1A corridor, including the following:

- Route 1A northbound flyover at Boardman Street
- Addition of a lane to Route 1A southbound
- Signalization of the Waldemar Avenue/Route 1A intersection
- Expansion and signalization of the Tomasello Drive intersection

In addition, the ENF identifies potential projects to shift regional and project-related traffic from the Route 60 corridor to the Route 1/Route 16 corridor in response to consultations with the City of Revere and the City of Chelsea:

- New ramp connections at the Route 1/Route 16 interchange
- Improvements along the Revere Beach Parkway corridor

Comments from MassDOT and BTD do not provide an evaluation or endorsement of these access alternatives. Using the data and analysis developed for the traffic study as a basis, the DEIR should include an alternatives analysis that considers a range of roadway improvements for the 1A corridor between Boardman Street and Route 145. Improvements should be identified that can address long-term regional goals for the corridor and provide adequate access to the site. I strongly recommend that the Proponent consult with MassDOT, DCR, the City of Boston, and the City of Revere regarding the development of this analysis and identification of mitigation alternatives prior to filing the DEIR. **MEPA 29**

The DEIR should include conceptual plans at a reasonable scale (e.g. 80-scale) for the proposed roadway improvements that clearly show proposed lane widths and offsets, layout lines and jurisdictions, and the land uses (including access drives) adjacent to areas where improvements are proposed. Land acquisition and/or easements required to support improvements should be identified in the DEIR. Any environmental impacts associated with roadway improvements should be identified (in text and on project plans) and quantified within the DEIR (i.e. wetlands impacts, stormwater, etc). In addition, the DEIR should identify consistency of access drives and roadway improvements with a Complete Streets design approach that provides adequate and safe accommodation for all roadway users, including drivers, pedestrians, cyclists and transit riders. The DEIR should include a site circulation plan that clearly identifies how vehicular (including trucks, shuttle buses, tour buses), pedestrian and bicycle access will be provided throughout the site. **MEPA 30** **MEPA 31** **MEPA 32** **MEPA 33**

Transportation Demand Management

The ENF indicates that the DEIR will include a comprehensive TDM Program that will provide incentives for using alternative transportation and discourage single-occupancy-vehicle (SOV) trips. The TDM program should evaluate all feasible measures to reduce trip generation associated with the project. It should include specific, defined mode share goals that target high rates of transit, bicycle, and **MEPA 34**

pedestrian use. Data and analysis of existing modes (including public transportation, walking, and bicycling), future demand and origin-destination patterns of casino employees and patrons, should be employed to identify physical improvements and supporting programs to increase these modes. The DEIR should specifically address TDM measures identified in the MassDEP comment letter.

The ENF identifies physical improvements to bicycle and pedestrian access to, and circulation within, the project site including bicycle parking, expansion of the bicycle network by providing on-street bicycle accommodations along the Bennington Street corridor, enhanced shuttle service, and improved access from neighborhoods to and through the site.

Comments from Walk Boston indicate agreement with the general design and its emphasis on providing safe access for pedestrians. The comments include constructive recommendations regarding design details, potential alternative routes and echoes comments from MassDOT regarding introducing permeability along the property line with adjacent neighborhoods, particularly with the Orient Heights neighborhood. I strongly encourage the Proponent to consult with Walk Boston regarding the development of pedestrian access to and within the site as well as incorporation of safe pedestrian access for off-site roadway improvements. The Proponent should consult with MassRIDES to identify additional TDM measures applicable to the project. **MEPA 35**

Public transportation should be a core component of the mitigation program. Comments from the MBTA and others indicate that the project has a unique opportunity to be fully integrated with the existing transit network. The Proponent should consult with MassDOT and the MBTA regarding existing service and ridership, potential impacts to MBTA Blue Line and bus routes, and provision of adequate transit infrastructure and amenities to encourage transit usage, including effective pedestrian connections to the site from the MBTA Blue Line, from bus routes and/or incorporation of on-site bus shelters/turnout. In particular, it should identify additional demand at the MBTA Suffolk Downs and Beachmont Stations and indicate whether structural and/or capacity improvements are necessary to meet demand and/or comply with current codes for safety, accessibility or other critical functions. MassDOT requests that the DEIR include a Build scenario for the #119 and #120 bus routes to identify increased demand for bus service and whether increases would affect the ability to maintain MBTA service standards. Operational impacts to MBTA bus service from increased traffic generation should be identified. In addition, transit availability and schedules should be considered in the development of shift schedules. Measures to address gaps in overnight transportation service by coordination with Massport Logan Express, airport shuttles, the MBTA sunrise service and private bus lines should be explored. **MEPA 36** **MEPA 37**

The ENF indicates that the Proponent will collaborate with the MBTA to determine ways to enhance the connections between the Suffolk Downs Station and the project. Stronger pedestrian, bicycle and shuttle bus connections will be made onsite to promote use of the station. The role and relative importance of Beachmont Station to the project should be clarified. The DEIR should identify the extent to which the Beachmont Station will be used by employees and patrons, and how access to the site may be improved further if studies identify constraints at the Suffolk Downs Station that warrant significant investment in infrastructure or operations. The DEIR should identify access alternatives from Beachmont Station and the Beachmont neighborhood that could reduce walking distances to the casino facilities and the adjacent shopping center. It should indicate whether any planned improvements to or consolidation of stables have the potential to facilitate more direct access. **MEPA 38**

The study should also consider expansion of the shuttle service from the MBTA Suffolk Downs T Station. It should evaluate development of a route that would serve both stations and other potential locations, such as the intersection of Tomasello Drive and Route 1A, the intersection of Tomasello Drive and Furlong Drive (and/or within the shopping center), and at remote areas of the parking lot. Such a route may be in addition to a direct route from the Suffolk Downs Station. The analysis should indicate whether the existing gated drive that connects the southeastern corner of the site with the Suffolk Downs Station will be used to provide a more direct connection than Waldemar Drive. **MEPA 39**

Parking

The project design includes 5,150 parking spaces, comprised of surface parking and structured parking. This is a reduction of 850 spaces compared to existing conditions and will reduce impervious surfaces by 9 acres. The ENF indicates that the DEIR will include a detailed parking demand and supply analysis. The DEIR should include a parking study that identifies assumptions and methodology used to project parking demand. This should be developed based on parking needs and supplies for comparable facilities, taking into account the urban location, access to transit and access to adjacent neighborhoods. It should identify type of parking required (e.g. patrons, employees, parking for private buses), parking demand at different times of day and, expected parking duration. The DEIR should describe opportunities for reducing the total amount of parking, which should be substantial considering the mixed use nature of the project and proximity to large retail areas and satellite parking, and consider banking parking until construction is warranted by demand. Strategic use of shared parking (on- and off-site) and provision of the minimum parking necessary, can support additional reductions in impervious surfaces, and will support the effectiveness of the TDM Program. The TDM Program should incorporate policies designed to minimize parking demand, including fees for parking and parking cash-out policies. **MEPA 40**

The Proponent should consider provision of charging stations and preferential parking for plug-in electric vehicles. It should provide preferential parking for hybrid or alternatively-fueled vehicles, carpool or vanpools and provide space for a shared car program (e.g. ZipCars). The Proponent should also consider supporting expansion of the Hubway bike share program to East Boston by providing an on-site docking station. **MEPA 41** **MEPA 42**

Monitoring Program

The DEIR should include a proposed monitoring program to evaluate assumptions regarding traffic generation, mode splits and, effectiveness of the traffic mitigation program and the TDM program. The Proponent should consult with MassDOT regarding the duration and frequency of monitoring, the identification of triggers for identification and implementation of additional improvements or programs. The Proponent should provide a clear commitment to implement and continuously fund the TDM Program. **MEPA 43**

In addition, the project is subject to the MassDEP Rideshare Regulation (310 CMR 7.16), a clean air program that applies to employers with 250 or more daily employees and includes reporting requirements.

Airspace/Aviation

The project site appears to be located within protected airport approach and/or transitional airspace areas as defined by state law (MGL, Chapter 90, Section 35B) and Federal regulations (Federal Aviation Regulation Part 77, Objects Affecting Navigable Airspace). State and federal notice is required for proposed buildings, parking lots/structures, lighting (within parking lot, street lights/traffic lights, temporary lighting during construction) and use of cranes. **MEPA 44**

Comments from Massport indicate that the proposed building heights are at or close to several airport approach and or transitional areas as defined by state law and federal regulations and, therefore, careful analysis of potential impacts is warranted. The Proponent should consult with Massport and the MassDOT Aeronautics Division regarding project elements, including lighting and consideration of reflective building materials or use of solar panels, to avoid glare that could impact aviation.

Air Quality

In accordance with the State Implementation Plan (SIP) for ozone attainment, the Proponent must conduct an indirect source review analysis because this is a mixed-use project generating 6,000 or more new adt. This analysis should be conducted in accordance with MassDEP Guidelines for Performing Mesoscale Analysis of Indirect Sources. The proponent should consult with MassDEP for guidance and for confirmation of the appropriate study areas. If hydrocarbon emissions associated with the Build scenario are greater than the No Build scenario, the proponent is required to provide mitigation, including the development of a TDM Program. **MEPA 45**

The MassDEP comment letter identifies potential certifications and permits that may be required for on-site energy sources such as boilers, stationary turbines, emergency generators, etc. The DEIR should identify certification and/or permits that likely will be required for proposed project elements. **MEPA 46**

Wetlands /Drainage

The project will be reviewed by the City of Boston Conservation Commission and the Revere Conservation Commission for its consistency with the Wetlands Protection Act and associated regulations (310 CMR 10.00), including stormwater management standards. The project will alter approximately 480,000 sf of BLSF and 1,100 sf of Riverfront Area. Alteration to BLSF is associated with raising site elevations in some areas to construct the interior driveways and parking areas, utility connections and stormwater management system improvements. Impacts to Riverfront Area is associated with minor re-grading to install stormwater management BMPs. Off-site roadway improvements will alter approximately 40,000 sf of LSCSF and 20,000 sf of buffer zone to Coastal Bank and Salt Marsh. The majority of work affecting wetland resource areas is located within previously altered areas.

The DEIR should demonstrate that the project can be designed and constructed consistent with performance standards. It should include plans at a reasonable scale that clearly delineate all applicable resource area boundaries including riverfront area, buffer zones, 100-year flood elevations, and tidelands. The DEIR should quantify the project's estimated impact on each resource area. It should describe the nature of all impacts that cannot be avoided including grading, clearing and construction- **MEPA 47**

related disturbances and whether they are temporary or permanent in nature. The project will reduce existing impervious surfaces by 9 acres. This reduction, combined with installation of a new stormwater management system, will support improved water quality. Further reductions in impervious surfaces may be feasible. The DEIR should identify and evaluate all feasible methods to reduce impervious surfaces, including reduced parking ratios, banking of parking, and narrow roadway widths. **MEPA 48**

The DEIR should include a stormwater management plan that demonstrates that source controls, pollution prevention measures, erosion and sediment controls and the drainage system will comply with the stormwater standards for water quality and quantity both during construction and post-development. If subsurface infiltration is proposed, the DEIR should demonstrate that soils and groundwater conditions are suitable for such discharges. It should include a commitment to develop an operations and management plan to ensure the long-term effectiveness of the stormwater management system. The locations of detention basins, distances from wetland resource areas and the expected quality of the effluent from the basins should be identified. The Proponent will be required to prepare a Stormwater Pollution Prevention Plan (SWPPP) in accordance with the NPDES Permit. **MEPA 49**

The ENF indicates that the project will not entail changes to the CAFO stormwater separation project completed in 2012. Drainage form the stable area is directed to a retention pond inside the racetrack. Wastewater is pumped from the retention pond to the BWSC sanitary sewer system within Walley street. Clean rooftop runoff from the stables is collected and discharged into the existing drains system to Sales Creek. In the context of considering climate change adaptation measures, the DEIR should evaluate measures that could be employed to provide enhanced protection from less frequent storm events (e.g., 25-year). **MEPA 50**

The Proponent should carefully review comments from MassDEP, the City of Boston and the Revere Planning and Community Development Department regarding wetlands and drainage issues. The ENF indicates the Proponent will consider incorporation of Low Impact Development (LID), water quality swales and bioretention basins. The DEIR should address these alternatives in more detail. In addition, I encourage the Proponent to consider how Sales Creek and associated drainage channels could be designed as a project amenity. **MEPA 51** **MEPA 52**

Landlocked Tidelands

The ENF indicates that the site includes landlocked, filled tidelands consistent with a previous MassDEP decision documented in a June 2000 letter (Attachment F). Comments from MassDEP indicate that it confirmed this decision through a review of previous Chapter 91 licenses, dating back to the 1800's, that were issued for the filling of tidelands, installation of tidegates, and creation of drainage features at and adjacent to the project site.

Projects on landlocked tidelands are subject to the provisions of *An Act Relative to Licensing Requirements for Certain Tidelands* (2007 Mass. Acts ch. 168). Consistent with Section 8 of this legislation, I must conduct a Public Benefits Review as part of the EIR review of projects located on landlocked tidelands that entail new use or modification of an existing use and I must make a Public Benefits Determination within 30 days of the issuance of the Certificate on the Final EIR (FEIR).

Section 3 of this legislation requires that any project that is subject to MEPA review and proposes a new use or structure or modification of an existing use or structure within landlocked tidelands address the project's impacts on tidelands and identify measures to avoid, minimize or mitigate any adverse impacts on these rights. **MEPA 53**

> *"In making said public benefit determination, the secretary shall consider the purpose and effect of the development; the impact on abutters and the surrounding community; enhancement to the property; benefits to the public trust rights in tidelands or other associated rights, including, but not limited to, benefits provided through previously obtained municipal permits; community activities on the development site; environmental protection and preservation; public health and safety; and the general welfare; provided further, that the secretary shall also consider the differences between tidelands, landlocked tidelands and great pond lands when assessing the public benefit and shall consider the practical impact of the public benefit on the development."*

The DEIR should address each of the considerations identified in the legislation and provide information to support this review. The Proponent should consider comments from TBHA, BHIA, MyRWA, the Friends of Belle Isle Marsh and others for consideration of measures that may support the PBD such as contributions to water transportation, support for tourism within and around Boston Harbor including the Boston Harbor Islands, and improvements to Belle Isle Marsh.

Water Supply

The project will increase water demand by 379,910 gpd for a total of 435,810 gpd. This includes 58,000 gpd for landscape irrigation and 22,400 gpd for racetrack irrigation and maintenance. The BWSC will continue to service the site. The City of Revere provides a limited amount of water (15,700 gpd). The ENF indicates that continued water service from Revere is under consideration. The ENF indicates that a new water service connection will be provided in Waldemar Avenue in approximately the same location as the existing connection. No changes are proposed to the 4" connection that serves the CAFO. The EIR should identify infrastructure improvements for water supply, demonstrate that adequate hydraulic capacity will be provided to serve the project, and identify measures to reduce water use, including reuse of grey water. **MEPA 54**

Comments from MWRA note that MWRA water mains are located in the vicinity of proposed replacement of the water main in Waldemar Avenue. The Proponent should consult with the MWRA to determine whether an 8(m) Permit is required to build, construct, excavate or cross within MWRA infrastructure. **MEPA 55**

The ENF identifies a range of water conservation measures that will be incorporated into the project. The DEIR should identify and describe commitments to water conservation and estimate associated decreases in demand. The hotels, in particular, provide numerous opportunities to reduce daily water demand by guests including the use of low-flow fixtures, modifications or the use of BMPs associated with laundry and food services, and guest education. Comments from BWSC recommend that timers, soil moisture indicators and rainfall sensors be installed in any in-ground sprinkler systems. The DEIR should explore opportunities for greywater recycling for use in sanitary facilities, irrigation, or ornamental uses (e.g. fountains). The DEIR should provide an analysis of potential water supply demand **MEPA 56**

reductions that may be achieved through the implementation of greywater recycling infrastructure and feasibility of implementing such a system.

Wastewater

The project requires a Sewer Connection Permit from MassDEP and a Sewer Use Discharge Permit (or waiver) from the MWRA. The ENF identifies existing wastewater generation, existing infrastructure, identifies additional wastewater generation and identifies new wastewater infrastructure. A gravity sewer line runs north-south and connects to a private sewer pump station located on the southerly side of the property. Wastewater is pumped via force main to the existing 12" sewer in Waldemar Avenue. Sewage and street drainage from the stables area is pumped from the settling pond in the northeastern area of the racetrack and discharges to the BWSC system near the MBTA Suffolk Downs Station. A separate storm drainage system collects rooftop runoff.

The ENF indicates that the project will generate an additional 307,080 gpd of wastewater for a total of 473,100 gpd. Approximately 323,100 gpd is associated with domestic wastewater and 150,000 gpd is associated with the CAFO. Comments from MassDEP and BWSC indicate that the DEIR should include revised wastewater flow projections. Projections should be developed consistent with 314 CMR 7.15 or 310 CMR 15.203 (2)-(5). Existing flows that will be maintained may be evaluated using existing meter data. The DEIR should detail the method for projecting wastewater flows. **MEPA 57**

The ENF indicates that the existing infrastructure has adequate capacity to support the project; however, redevelopment will include the replacement and/or relocation of infrastructure. Renovation of the grandstand building will include installation of a new gravity sewer main. In addition, a new force main is proposed to connect to the sewer pipe. Wastewater flows that are discharged to the sewer in Waldemar Avenue will be diverted to a discharge point downstream of the residential neighborhood. Wastewater will continue to be discharged to the BWSC system (East Boston Low Level Sewer (EBLLS)) for treatment and discharge at the MWRA Deer Island Wastewater Treatment Facility.

Comments from MassDEP, the MWRA and BWSC indicate that the Proponent will be required to participate in the MWRA flow control program to remove extraneous clean water, infiltration and inflow (I&I) from the sewer system. The Proponent will be required to offset flows associated with the project by removing I/I on a 4:1 basis of 4 gallons removed for every gallon generated. In addition, comments from the MWRA indicate that the EBLLS can be exceeded in large storms, due to high volumes of infiltration and inflows and can contribute to local system backups.

Comments from MassDEP note that the Proponent should continue to adhere to conditions and requirements of the Sewer Use Discharge Permit that authorizes the existing discharge from the CAFO.

The DEIR should include updated projections of wastewater generation, describe existing and proposed wastewater infrastructure for the entire site (including the horse barns), and identify measures to minimize wastewater demand and mitigate project impacts. **MEPA 58**

Hazardous Waste

The ENF indicates that a release of heavy metals, petroleum and polyaromatic hydrocarbons (PAH) was reported to MassDEP in 1997 and was assigned a Release Tracking Numbers (RTN) (3-14857). The file was closed in February 1998 with a Permanent Solution Class B-1 Response Action Outcome (RAO). No Activity and Use Limitation (AUL) was placed on the property. The project does not propose any disturbance of the easement area associated with the RTN. In addition, the ENF notes that a Phase I and Phase II Environmental Site Assessment, including subsurface investigations with soil and groundwater sampling and testing were completed in 2007. The report identified low levels of contaminants in soil and/or groundwater consistent with an urban site.

In the event that any new releases are discovered during demolition or construction, the status of the release in accordance with the Massachusetts Contingency Plan (MCP) should be identified in the DEIR. **MEPA 59**

Historic Resources

As noted previously, the Suffolk Downs Clubhouse, Grandstand and Racetrack (BOS.209) are included in the MHC Inventory of Historic and Archaeological Assets of the Commonwealth and may meet the criteria for listing in the State and National Registers of Historic Places. The project includes the renovation of the Grandstand and Clubhouse, demolition of the existing link between these structures and demolition of an office building and utility building.

Comments from MHC request that information to assist it in evaluating potential impacts of the project be provided prior to the filing of the DEIR. This includes an updated MHC Form A (Area Form) supported by current color photographs of all extant buildings and features and identification of the dates of construction and alterations if available. In addition, MHC indicates that the DEIR should clearly identify any and all potential alterations to the Revere Beach Parkway (REV.H), which is listed in the State and National Registers of Historic Places. **MEPA 60**

Construction Period Impacts

The EIR should include a discussion of construction phasing, evaluate potential impacts associated with construction activities (including but not limited to noise, vibration, dust, and traffic flow disruptions) and propose feasible measures to avoid or eliminate these impacts. The phasing plan should identify whether racetrack operations will continue during construction and, if so, how parking and other needs will be accommodated during construction. The ENF indicates that a draft Construction Management Plan (CMP) will be included in the DEIR. **MEPA 61** **MEPA 62**

The project must comply with MassDEP's Solid Waste and Air Quality Control regulations, pursuant to M.G.L. Chapter 40, Section 54, during demolition and construction. I note that the project will result in the generation of demolition waste, portions of which contain asbestos. Removal or abatement of regulated asbestos-containing material must be completed consistent with the requirements of 310 CMR 7.15 and the Proponent must provide an asbestos notification form (ANF 001) to MassDEP. The ENF indicates that the construction waste management plan will include a minimum **MEPA 63** **MEPA 64**

reuse/recycling goal of 75%. The DEIR should indicate whether a Beneficial Use Determination (BUD) will be required for any proposed reuse/recycling.

Because the project is located adjacent to residential areas, I encourage the Proponent to mitigate the construction period impacts of diesel emissions to the maximum extent feasible. This mitigation may be achieved through the installation of after-engine emission controls such as diesel oxidation catalysts (DOCs) or diesel particulate filters (DPFs), or the use of equipment that meets Tier 3 or Tier 4 emission standards for non-road construction equipment. Comments from MassDEP note that project contractors are required to use ultra low sulfur diesel (ULSD) fuel (15 parts per million sulfur) in off-road engines and provides additional resources to assist with implementation of this program. The DEIR should indicate measures that will be incorporated into the project. **MEPA 65**

Mitigation

The DEIR should include a separate chapter that identifies all mitigation measures. This chapter should also include separate draft Section 61 Findings for each State Agency that will issue permits for the project. The draft Section 61 Findings should contain clear commitments to implement mitigation measures, estimate the individual costs of each proposed measure, identify the parties responsible for implementation, and include a schedule for implementation. In addition, it should include a commitment to provide a self-certification document indicating that GHG measures have been incorporated into the project. **MEPA 66**

Comments

The DEIR should contain a copy of this Certificate and a copy of each comment letter received. To ensure that the issues raised by commenters are addressed, the DEIR should include responses to comments. This directive is not intended to, nor shall it be construed to, enlarge the scope of the DEIR beyond what has been expressly identified in this certificate. **MEPA 67**

Circulation

The Proponent should circulate the DEIR to the individuals and organizations who commented on the ENF, to any State Agencies from which the Proponent will seek permits or approvals and to any parties specified in section 11.16 of the MEPA regulations. In addition, the DEIR should be made available for review at the Boston Public Library (BPL), the East Boston Branch of the BPL and the Revere Public Library. **MEPA 68**

MEPA 01 **The DEIR should include a detailed description of the proposed Project and identify any changes to the Project since the filing of the ENF. It should include all Project elements, including racetrack operations, a description of potential changes to the horse barn area, and associated maintenance. It should include updated site plans for existing and proposed conditions at a legible scale.**

A detailed Project description, which addresses all elements of the Project, is provided in Section 1.0, and changes to the Project since the ENF was filed are summarized in Section 1.5. Updated site plans for existing and proposed conditions are also referenced in Section 1.0 and provided in Volume II, Project Figures.

MEPA 02 **The DEIR should identify all State permits and approvals required for the Project and identify how the Project will be developed consistent with associated regulatory standards and requirements. In addition, it should describe Project phasing and identify how permitting will be addressed within the context of this phasing.**

Table 3-1 identifies the anticipated permits, approvals, and reviews required for this Project. Project consistency with regulatory standards and requirements are addressed in various sections of the Draft EIR in the context of specific issue areas. The Project schedule and phasing plan is described in Section 1.11.

MEPA 03 **The DEIR should identify the Project's consistency with EO384, the Commonwealth's Sustainable Development Principles, and regional and local land use plans, including the East Boston Master Plan (April 2000), the City of Revere Massachusetts FY 2010-2015 Strategic Plan, and the Boston Region MPO Journey to 2030 (September 27, 2007).**

Project consistency with these various planning documents is addressed in Section 3.4.

MEPA 04 **To provide context for the Project review, the DEIR should provide a summary of the relevant sections of the Expanded Gaming Act and associated regulations, the Project application process, and the development of Host and Community Agreements.**

Section 3.3 contains discussions of the relevant sections of the Expanded Gaming Act and associated regulations, Section 3.3.2 addresses the Project application process, and Section 3.3.3 describes the HCAs. Copies of the Boston and Revere HCAs are provided in Attachment B.

MEPA 05 **The DEIR should identify elements of the Project that are required by the [Expanded Gaming Act] and/or regulations and the extent to which the size and associated impacts of the Project are driven by gaming requirements, such as the minimum capital investment for a category 1 license.**

Section 1.9.1 describes the extent to which the size and associated impacts of the Project are driven by gaming requirements and licensing criteria.

MEPA 06 **The DEIR should provide a more realistic mixed-use development scenario for the site to support a better understanding of the relative impacts of a resort casino compared to a mixed-use development.**

Section 1.9 contains an alternatives analysis that includes discussion of two alternative development scenarios.

MEPA 07 **The DEIR should identify each alternative's impacts on land alteration, creation of impervious area, impacts to wetland resource areas, public benefits associated with landlocked tidelands, traffic generation, parking, water use, and wastewater. This comparison should be provided in a tabular format with supporting narrative and conceptual site plans.**

Table 1-4 compares the impacts from the proposed Project with a No-Build alternative as well as two alternatives for development of the site.

MEPA 08 **The DEIR shall include an analysis of GHG emissions and mitigation measures in accordance with the standard requirements of this Policy. The analysis should quantify the direct and indirect GHG emissions associated with the Project's energy use and transportation-related emissions... The DEIR should identify and commit to mitigation measures to reduce GHG emissions.**

A GHG analysis is provided as Section 7.0, and this analysis quantifies direct and indirect GHG emissions associated with the Resort. Proposed mitigation measures are described in Section 7.2 and 7.5, and other mitigation measures are discussed in Section 7.4.

MEPA 09 **The DEIR should include a GHG emissions analysis that calculates and compares GHG emissions associated with: (1) a Massachusetts Building Code-compliant baseline (based on the Massachusetts Building Code 8th Edition (chapter 780 CMR 13.00)), which has been amended to adopt and integrate with the current version of the IECC or ASHRAE 90.7-2007; and (2) a Preferred Alternative that include energy efficiency design measures to achieve compliance with the Stretch Code. The**

Policy requires Proponents to use energy modeling software to quantify projected energy usage from stationary sources and energy consumption and modeling should be developed in accordance with ASHRAE 90.1-2007 Appendix G.

The requested GHG analysis is provided in Section 7.0.

MEPA 10 The Proponent should identify the model used to analyze GHG emissions, clearly state modeling assumptions, explicitly note which GHG reduction measures have been modeled, and identify whether certain building design or operational GHG reduction measures will be mandated by the Proponent to future occupants or merely encouraged for adoption and implementation. The DEIR should include the modeling printout for each alternative and emission tables that compare base case emissions in tpy with the preferred alternative showing the anticipated reduction in tpy and percentage by emissions source (direct, indirect and transportation).

This information is provided in the GHG analysis in Section 7.0 as well as in Attachment D, which contains the GHG Technical Appendices.

MEPA 11 The feasibility of each of the mitigation measures outlined below should be assessed for each of the major Project elements, and if feasible, GHG emissions reduction potential associated with major mitigation elements should be evaluated to assess the relative benefits of each measure.

- Minimize energy use through building orientation and evaluate its impacts on energy usage, including solar gain, day-lighting and viability of solar PV systems;
- Use of high-albedo roofing materials;
- Install high-efficiency HVAC systems and adequate numbers of thermal zones to support temperature controls;
- Reduce energy use through peak shaving or load shifting strategies;
- Maximize interior day-lighting through floor-plates, increased building perimeter and use of skylights, clerestories and light wells;
- Incorporate window glazing to rebalance and optimize daylighting, heat loss and solar heat gain performance;
- Incorporate roof and wall insulation to minimize heat loss and minimize uncontrolled infiltration through the building envelope;
- Incorporate lighting motion sensors, climate control and building energy management systems;
- Install energy efficient lighting, both exterior and interior;

- Evaluate additional measures to reduce Project plug loads, including the use of more efficient equipment (such as Energy Star), consider energy consumption as a factor in the selection of special equipment, such as slot machines, and consider power management techniques; and
- Install water source heat pumps (hotel rooms only).

These and other mitigation measures are described and evaluated in Section 7.0.

MEPA 12 The CHP feasibility analysis should consider state incentives to support CHP as well as information provided by MassDEP regarding the use of CHP at a significant number of casinos and large hotels. The feasibility analysis should include consideration of one of the major benefits of a CHP system – the ability to produce off-grid power.

As described in Section 7.2, CHP is a proposed element of the Project design. The CHP analysis and engineering effort addresses incentives for CHP as well as the information provided by MassDEP regarding CHP use in casinos and hotels. It is anticipated that back-up power for the facility will be provided by emergency generators, rather than by CHP, because of the large standby power needs of the facility.

MEPA 13 Evaluation of PV systems should consider state incentives to promote the use of PV systems (Commonwealth Solar II and Commonwealth Solar Stimulus). At a minimum, buildings should be oriented to the south to maximize solar exposure and, if the analysis demonstrates that such systems are presently infeasible, they should be "solar ready" to facilitate future installation of PV systems.

Building orientation and application of PV are discussed in Section 7.2.

MEPA 14 The Proponent should consult with MassDEP regarding the amendment of its regulations to build capacity for organics management and associated permitting requirements.

The Project's organic waste management plan is described in Section 7.2.8.3.

MEPA 15 The DEIR should explain, in reasonable detail, why certain measures, which could provide significant GHG reductions, were not selected – either because it is not acceptable to the Project or is considered technically or financially infeasible. As noted by MassDEP, the Proponent should also consider TDM measures... and adoption of additional sustainable design measures for which GHG reductions cannot be easily quantified, such as recycling efforts and water conservation measures, that can be incorporated into the Project. Additional GHG reductions can be achieved through effective materials management during the design,

construction, and operations phases of the Project. These measures will be considered when evaluating whether the Project can mitigate its GHG emission to the greatest extent practicable.

Section 7.4 includes a discussion of mitigation measures that are not currently adopted in the Project design as well as measures for which GHG reduction impacts are not easily quantifiable but are important to sustainable design.

MEPA 16 The DEIR should include an analysis of potential GHG emissions related to the treatment and conveyance of wastewater or withdrawal, treatment and conveyance of potable and/or non-potable water.

The GHG analysis in Section 7.3.2 accounts for water and wastewater.

MEPA 17 While I encourage the Proponent to adopt those GHG reduction measures that are integrated into the building's core, shell and infrastructure, some measures may be transient or dependent on operational procedures implemented by the future occupant. In those instances, the Proponent should consider reasonable measures to educate and create incentives for the tenants to adopt energy efficiency/renewable generation measures. The DEIR should address the Proponent's commitment to providing energy efficiency consulting services and information and/or developing a tenant manual that requires or strongly supports GHG reduction measures.

Proponent's influence with tenants is described in Section 7.2.8.1.

MEPA 18 The DEIR should identify whether the Project will include fleet vehicles. For the purposes of the GHG Policy, fleet vehicles are generally considered to be a source of direct GHG emissions from vehicles used by a project proponent in the everyday operation of a facility. In this case, these may include shuttle buses for employees and patrons, landscaping or catering vehicles, etc.

GHG emissions of fleet vehicles and mitigation measures employed are described in Section 7.5.1.

MEPA 19 The DEIR should include a commitment to provide a self-certification to the MEPA Office at the completion of each building or group of buildings. It should be signed by an appropriate professional… indicating that all of the GHG mitigation measures, or equivalent measures that are designed to collectively achieve identified reductions in stationary source GHG emission and transportation-related measures, have been incorporated into the Project.

The GHG analysis summary provided in Section 7.6.2 contains this self-certification commitment, and this commitment is also reflected in the proposed Section 61 Findings in Section 10.0.

MEPA 20 **The Project must be designed to comply with Massachusetts State Building Code requirements for structures within the floodplain and local requirements.**

Resort buildings will not be within the flood zone.

MEPA 21 **Because the resort is designed to serve a significant number of patrons and is located in an area that could be directly affected by more severe storms and increased flooding, the Proponent should consider measures to generate on-site power in the event of disruptions in service to the electrical grid.**

In the event of a natural disaster and loss of utility power, standby power will be generated by standby generators. It is anticipated that two generators, each two megawatts in capacity, will serve the site and will be capable of providing power for emergency and life safety needs as well as basic building functions (e.g., maintaining partial heating for the buildings).

MEPA 22 **The DEIR should present capacity analyses and a summary of average and 95th percentile vehicle queues for each intersection within the study area. The DEIR should also present a merge and diverge for each ramp junction and weaving analysis for all the interchanges located in the study area. Any proposed traffic signals must include a signal warrant analysis conducted according to the MUTCD. The results of this analysis should be provided in a tabular format that identifies Existing, Future No-Build, and Future Build Conditions for all peak hour conditions. Analysis should use a 10-year horizon (2022) for the traffic study and a 20-year horizon for analysis of proposed infrastructure improvements.**

The requested transportation analyses are presented in Section 5.0.

MEPA 23 **Comments from MassDOT, MBTA, and DCR recommend that the following locations be incorporated into the study area:**

- **Route 60/Charger Street**
- **Route 60/Sigourney Street**
- **Route 1/Copeland Circle interchange (including the rotary and adjacent segments)**
- **Route 1A/Wonderland MBTA Station Driveway**
- **Route 1A/Revere Street (signalized intersection)**

In addition, MassDOT requests that a roadway section analysis, prepared in accordance with the HCM, be provided for the three harbor tunnels (Ted Williams Tunnel, Callahan Tunnel, and Sumner Tunnel) to identify daily volumes and peak characteristics.

Comments from BTD and the Revere Planning and Community Development Department request that the following locations be incorporated into the study area:

- Route 1A/Curtis Street
- Saratoga Street/Neptune Avenue
- Bremen Street/Neptune Road
- Bennington Street/Crescent Avenue

The additional locations requested by MassDOT, MBTA, DCR, BTD, and the Revere Planning and Community Development Department have been incorporated in the study area for the transportation analysis presented in Section 5.0, and are noted specifically in Section 5.2.6. Traffic volume data for the harbor tunnels are discussed in Section 5.2.7.

MEPA 24 The Proponent should consult with MassDOT regarding use of ATR and TMC to measure existing volumes, and whether additional and/or more recent counts are required for the study. In particular, the study should include the most recent data available for the Ted Williams Tunnel, Sumner Tunnel and Callahan Tunnel.

Validation of traffic data and additional counts requested by MassDOT are presented in Sections 5.2.7, 5.2.8, and 5.2.9.

MEPA 25 The study should evaluate existing conditions for transit, pedestrian and bicycle access, including an inventory of existing transit service, existing pedestrian access routes to the site, and an inventory of the existing bicycle network in the area. It should identify constraints that limit transit, walking and bicycle trips. It should include ridership estimates for the MBTA Suffolk Downs and Beachmont Stations and pedestrian and bicycle volumes.

Analyses of existing transit, pedestrian, and bicycle access, including MBTA ridership data, are presented in Section 5.2.

MEPA 26 The Proponent should consult with the MassDOT Office of Transportation Planning and the MBTA Service Planning Department to develop appropriate and reasonable travel demand and trip generation characteristics.

The Proponent has had numerous consultations with MassDOT's Office of Transportation Planning (OTP), and through the OTP the MBTA Service Planning Department. A detailed description of travel demand and trip generation characteristics for the Project is presented in Sections 5.4.1 through 5.4.5.

MEPA 27 **MassDOT requests that a temporal distribution of traffic over a full one-week period be provided, to support identification of the peak hours of casino traffic and most critical peak analysis periods resulting from existing roadway volumes and Project site trips. Daily and peak hour trip projections by mode should be presented for patrons and employees separately and combined. Modeling and assumptions to determine the origin-destination patterns of trips should be clearly presented.**

Temporal distribution of existing roadway volumes is presented in Section 5.2.8. Temporal distribution of Project traffic is presented in Section 5.4.2. Daily and peak hour Project trip projections are presented separately for patrons and employees in Section 5.4.6. Vehicular trip distribution and assignment is presented in Section 5.4.7.

MEPA 28 **Several commenters identify the importance of considering the potential for overlapping peak periods with other major traffic generators in the area (e.g., Logan Airport, general traffic/tunnel or beach traffic on Saturdays in May and June). In particular, MassDOT identifies a concern that peak periods for general/tunnel traffic, Logan Airport traffic and the casino could overlap and result in an extended peak period of congestion in the tunnels. MassDOT indicates that the study should identify the worst combination of projected Project traffic and existing roadway volumes to determine the critical peak hours for analysis on Fridays and Saturdays.**

Studies completed for the Project have shown that the overlapping periods are minimized due to the nature of Resort-related trips and peak commuter and weekend hours. The worst combination of existing traffic and Project trips is identified in Sections 5.2.8 and 5.4.2.

MEPA 29 **Using the data and analysis developed for the traffic study as a basis, the DEIR should include an alternatives analysis that considers a range of roadway improvements for the 1A corridor between Boardman Street and Route 145. Improvements should be identified that can address long-term regional goals for the corridor and provide adequate access to the site. I strongly recommend that the Proponent consult with MassDOT, DCR, the City of Boston, and the City of Revere regarding the development of this analysis and identification of mitigation alternatives prior to filing the DEIR.**

An alternatives analysis of Route 1A infrastructure improvements is presented in Section 5.5. Other traffic, safety, and roadway improvements committed to in the HCAs with Revere and Boston are presented in Section 5.6. The Proponent has consulted with MassDOT, DCR, and with the cities of Revere, Boston, and Chelsea in developing plans for these improvements.

MEPA 30 **The DEIR should include conceptual plans at a reasonable scale (e.g., 80-scale) for the proposed roadway improvements that clearly show proposed lane widths and offsets, layout lines and jurisdictions, and the land uses (including access drives) adjacent to areas where improvements are proposed.**

Conceptual plans for proposed roadway improvements are presented in the relevant parts of Sections 5.5 and 5.6 as well as in Attachment A.

MEPA 31 **Land acquisition and/or easements required to support improvements should be identified in the DEIR.**

The Proponent owns fee title to the Project site. As discussed in Section 1.1, the Project includes certain off-site traffic improvements along Route 1A, including widening Route 1A and construction of infrastructure improvements at the intersection of Boardman Street and Route 1A in East Boston. The precise amount of land or rights in land ultimately required will depend on the alternative selected and the final design details of the improvements. The Proponent has begun discussions with certain property owners who own property in the proposed ROW and will continue to work with these property owners to obtain all rights required for construction, maintenance, and operation of the proposed Route 1A infrastructure improvements. Once constructed, ownership of the improvements and the necessary rights in land on which the improvements have been made will be transferred to the owner and operator of the roadway facility. The Proponent does not expect that any of the other transportation improvements proposed in accordance with the HCAs will require additional right-of-way.

MEPA 32 **Any environmental impacts associated with roadway improvements should be identified (in text and on Project plans) and quantified within the DEIR (i.e., wetlands impacts, stormwater, etc.).**

Environmental impacts associated with roadway improvements, based on the flyover concept, are discussed in Section 6.0.

MEPA 33 **The DEIR should identify consistency of access drives and roadway improvements with a Complete Streets design approach that provides adequate and safe accommodation for all roadway users, including drivers, pedestrians, cyclists, and**

transit riders. The DEIR should include a site circulation plan that clearly identifies how vehicular (including trucks, shuttle buses, tour buses), pedestrian, and bicycle access will be provided throughout the site.

The concept plans for access drive and roadway improvements presented in Sections 5.5 and 5.6 have been developed consistent with a Complete Streets approach. Site circulation plans based on a Complete Streets approach are presented in Section 4.0.

MEPA 34 The TDM program should evaluate all feasible measures to reduce trip generation associated with the Project. It should include specific, defined mode share goals that target high rates of transit, bicycle, and pedestrian use. Data and analysis of existing modes (including public transportation, walking, and bicycling), future demand and origin-destination patterns of casino employees and patrons, should be employed to identify physical improvements and supporting programs to increase these modes. The DEIR should specifically address TDM measures identified in the MassDEP comment letter.

A comprehensive TDM Plan is presented in Section 5.9.

MEPA 35 I strongly encourage the Proponent to consult with Walk Boston regarding the development of pedestrian access to and within the site as well as incorporation of safe pedestrian access for off-site roadway improvements. The Proponent should consult with MassRIDES to identify additional TDM measures applicable to the Project.

As suggested, the Proponent has scheduled meetings with WalkBoston and MassRIDES.

MEPA 36 Public transportation should be a core component of the mitigation program... The Proponent should consult with MassDOT and the MBTA regarding existing service and ridership, potential impacts to MBTA Blue Line and bus routes, and provision of adequate transit infrastructure and amenities to encourage transit usage, including effective pedestrian connections to the site from the MBTA Blue Line, from bus routes and/or incorporation of on-site bus shelters/turnout. In particular, it should identify additional demand at the MBTA Suffolk Downs and Beachmont Stations and indicate whether structural and/or capacity improvements are necessary to meet demand and/or comply with current codes for safety, accessibility or other critical functions.

The MBTA has provided existing service and ridership data to the Proponent. Analyses of existing conditions and potential impacts under Build conditions, including additional demand at Suffolk Downs Station, are presented in Sections 5.5.1 and 5.8.1, respectively. Supporting infrastructure and amenities are described in Sections 4.0, 5.8, and 5.9.

MEPA 37 **MassDOT requests that the DEIR include a Build scenario for the #119 and #120 bus routes to identify increased demand for bus service and whether increases would affect the ability to maintain MBTA service standards. Operational impacts to MBTA bus service from increased traffic generation should be identified. In addition, transit availability and schedules should be considered in the development of shift schedules. Measures to address gaps in overnight transportation service by coordinating with Massport Logan Express, airport shuttles, the MBTA sunrise service, and private bus lines should be explored.**

Increased demand for ridership on the #119 and #120 MBTA buses is discussed in Section 5.8.1.3, along with an analysis of potential operational impacts. The Proponent's off-site shuttle plan, described in Section 5.8.3.2, will provide alternative transportation during the night when the MBTA is not operating. As described in the TDM plan in Section 5.9, the Proponent will adjust employee shift times to the extent possible to reflect transit availability. In addition, the Proponent is committed to exploring coordinated services with Massport, the MBTA, and others.

MEPA 38 **The role and relative importance of Beachmont Station to the Project should be clarified. The DEIR should identify the extent to which the Beachmont Station will be used by employees and patrons, and how access to the site may be improved further if studies identify constraints at the Suffolk Downs Station that warrant significant investment in infrastructure or operations. The DEIR should identify access alternatives from Beachmont Station and the Beachmont neighborhood that could reduce walking distances to the casino facilities and the adjacent shopping center. It should indicate whether any planned improvements to, or consolidation of, stables have the potential to facilitate more direct access.**

In discussions with MBTA, MassDOT, and BTD, the Proponent has indicated that very limited use of Beachmont Station is expected by Resort patrons, and that the vast majority of patrons and employees using the Blue Line will use Suffolk Downs Station, which is a short walk from the Resort buildings and will be served by enhanced shuttle service. Independent of this consideration, as described in Section 5.6, the Proponent has committed to provide substantial streetscape and pedestrian improvements in Donnelly Square adjacent to Beachmont Station and along Winthrop Avenue between the station and the Project site access at Tomasello Drive.

MEPA 39 **The study should also consider expansion of the shuttle service from the MBTA Suffolk Downs T Station. It should evaluate development of a route that would serve both stations and other potential locations, such as the intersection of Tomasello Drive and Route 1A, the intersection of Tomasello Drive and Furling Drive (and/or within the shopping center), and at remote areas of the parking lot. Such a route may be in addition to a direct route from the Suffolk Downs Station. The analysis should indicate whether the existing gated drive that connects the southeastern corner of the site with the Suffolk Downs Station will be used to provide a more direct connection than Waldemar Drive.**

The Proponent's proposed on- and off-site shuttle plans are described in Sections 5.8.1 and 5.8.4.

MEPA 40 **The DEIR should include a parking study that identifies assumptions and methodology used to project parking demand. This should be developed based on parking needs and supplies for comparable facilities, taking into account the urban location, access to transit and access to adjacent neighborhoods. It should identify type of parking required (e.g., patrons, employees, parking for private buses), parking demand at different times of day, and expected parking duration. The DEIR should describe opportunities for reducing the total amount of parking, which should be substantial considering the mixed use nature of the Project and proximity to large retail areas and satellite parking, and consider banking parking until construction is warranted by demand. Strategic use of shared parking (on- and off-site) and provision of the minimum parking necessary, can support additional reductions in impervious surfaces, and will support the effectiveness of the TDM Program. The TDM Program should incorporate policies designed to minimize parking demand, including fees for parking and parking cash-out policies.**

The parking analysis for the Project is presented in Section 5.10. In addition, the TDM plan presented in Section 5.9 includes strategies to minimize parking demand.

MEPA 41 **The Proponent should consider provision of charging stations and preferential parking for plug-in electric vehicles. It should provide preferential parking for hybrid or alternately-fueled vehicles, carpool or vanpools and provide space for a shared car program (e.g., ZipCars).**

Charging stations, preferential parking for carpools/vanpools, and accommodation of a shared car program are included in the TDM plan presented in Section 5.9.

MEPA 42 **The Proponent should also consider supporting expansion of the Hubway bike share program to East Boston by providing an on-site docking station.**

As noted in Section 5.8.3, the Proponent has committed to providing two Hubway stations when the City of Boston expands the Hubway program to include East Boston.

MEPA 43 **The DEIR should include a proposed monitoring program to evaluate assumptions regarding traffic generation, mode splits, and effectiveness of the traffic mitigation program and the TDM program. The Proponent should consult with MassDOT regarding the duration and frequency of monitoring, the identification of triggers for identification and implementation of additional improvements or programs. The Proponent should provide a clear commitment to implement and continuously fund the TDM Program.**

Commitments to monitoring are identified in Section 5.9.5 and are to be coordinated with MassDOT and BTD. The Proponent has committed to joining the Logan TMA as part of its long-term commitment to TDM, and will require tenants to adopt equivalent TDM commitments.

MEPA 44 **The Project site appears to be located within protected airport approach and/or transitional airspace areas as defined by state law (MGL, Chapter 90, Section 35B) and Federal regulations (Federal Aviation Regulation Part 77, Objects Affecting Navigable Airspace). State and federal notice is required for proposed buildings, parking lots/structures, lighting (within parking lot, street lights/traffic lights, temporary lighting during construction) and use of cranes... The Proponent should consult with Massport and the MassDOT Aeronautics Division regarding Project elements, including lighting and consideration of reflective building materials or use of solar panels, to avoid glare that could impact aviation.**

The Proponent has had several meetings with Massport and FAA staff to discuss the potential impacts of Project elements on aviation, particularly at Logan Airport, and has also discussed the Project with the MassDOT Aeronautics Division. The Proponent will continue to engage with Massport and the MassDOT Aeronautics Division to ensure there are no negative impacts on aviation.

MEPA 45 **In accordance with the SIP for ozone attainment, the Proponent must conduct an indirect source review analysis because this is a mixed-use project generating 6,000 or more new adt. This analysis should be conducted in accordance with MassDEP Guidelines for Performing Mesoscale Analysis of Indirect Sources. The Proponent should consult with MassDEP for guidance and for confirmation of the appropriate study areas. If hydrocarbon emissions associated with the Build scenario are greater than the No Build scenario, the Proponent is required to provide mitigation, including the development of a TDM Program.**

The methodology and results from the mesoscale analysis are presented in Sections 6.5.4.1 and 6.5.5.1, respectively.

MEPA 46 **The MassDEP comment letter identifies potential certifications and permits that may be required for on-site energy sources such as boilers, stationary turbines, emergency generators, etc. The DEIR should identify certification and/or permits that likely will be required for proposed Project elements.**

Certifications and permits likely required for stationary sources are presented in Section 6.5.7.

MEPA 47 **The DEIR should demonstrate that the Project can be designed and constructed consistent with performance standards. It should include plans at a reasonable scale that clearly delineate all applicable resource area boundaries including RFA, buffer zones, 100-year flood elevations, and tidelands. The DEIR should quantify the Project's estimated impact on each resource area. It should describe the nature of all impacts that cannot be avoided including grading, clearing and construction-related disturbances and whether they are temporary or permanent in nature.**

On-site and off-site wetland resource areas are described in Sections 6.9.1 and 6.9.2, respectively. Potential Project impacts are quantified, and the resource areas are also depicted.

MEPA 48 **The DEIR should identify and evaluate all feasible methods to reduce impervious surfaces, including reduced parking ratios, banking of parking, and narrow roadway widths.**

The proposed parking layout has been designed to accommodate the minimum number of spaces required to meet the Resort demands. A multi-story parking garage is included to reduce the amount of surface parking needed, thus allowing for more green space on the Project site. All parking spaces will be 9 feet by 18 feet, and aisle widths have been minimized to reduce the amount of impervious surface on the site to the extent practicable.

MEPA 49 **If subsurface infiltration is proposed, the DEIR should demonstrate that soils and groundwater conditions are suitable for such discharges. It should include a commitment to develop an operations and management plan to ensure the long-term effectiveness of the stormwater management system. The locations of detention basins, distances from wetland resource areas, and the expected quality of the effluent from the basins should be identified. The Proponent will be required to prepare a SWPPP in accordance with the NPDES Permit.**

Extensive soil testing performed on-site indicates soil conditions are marginal for stormwater infiltration. The site design includes a maximized number of bioretention areas to infiltrate water and provide for evaporation of collected stormwater, thereby reducing runoff from the site. These basins will provide for cleaner and lower-volume stormwater runoff from the site relative to existing

conditions. An Operations and Maintenance Plan has been developed for the site and is included in the drainage report (see Attachment F). A draft SWPPP has also been prepared and is included with the drainage report.

MEPA 50 **In the context of considering climate change adaptation measures, the DEIR should evaluate measures that could be employed to provide enhanced protection from less frequent storm events (e.g., 25-year).**

Climate change adaptation measures have been included in the site design, including, among other measures, elevating buildings, roadways, and critical infrastructure above anticipated sea level rise elevations. Section 2.3 addresses climate change and adaptation.

MEPA 51 **The ENF indicates the Proponent will consider incorporation of LID, water quality swales, and bioretention basins. The DEIR should address these alternatives in more detail.**

LID drainage design has been incorporated into the Project design to the maximum extent practicable. Section 9.3 describes stormwater management, including LID drainage design and BMPs incorporated into the Project.

MEPA 52 **I encourage the Proponent to consider how Sales Creek and associated drainage channels could be designed as a Project amenity.**

Section 2.0 contains information about use of the site's green infrastructure as a visual, experiential, and educational amenity. The Project will improve water quality in Sales Creek since the proposed drainage system will be a significant improvement over the existing system, which was installed in the 1930s prior to implementation of stormwater management guidelines. Since the entire site drains to Sales Creek and ultimately Belle Isle Marsh, the Project will benefit these systems. Section 9.3 describes the proposed drainage system.

MEPA 53 **Section 3 of [the Landlocked Tidelands] legislation requires that any project that is subject to MEPA review and proposes a new use or structure or modification of an existing use or structure within landlocked tidelands address the project's impacts on tidelands and identify measures to avoid, minimize or mitigate any adverse impacts on these rights... The DEIR should address each of the considerations identified in the legislation and provide information to support this review.**

Section 6.7 contains a request for a Public Benefits Determination, and therein describes the Project's public benefits and protection of public rights.

MEPA 54 **The EIR should identify infrastructure improvements for water supply, demonstrate that adequate hydraulic capacity will be provided to serve the Project, and identify measures to reduce water use, including reuse of grey water.**

The Project team continues to work with the BWSC regarding developing mitigation strategies for the proposed Project to reduce water and wastewater impacts. The Project design includes three large rainwater reuse tanks that will collect roof runoff and enable the Proponent to reuse stormwater for cooling tower water, irrigation water, and track watering. Use of these tanks will save approximately 4.5 million gallons of water per year. Section 9.0 describes water, wastewater, and stormwater issues.

MEPA 55 **Comments from MWRA note that MWRA water mains are located in the vicinity of proposed replacement of the water main in Waldemar Avenue. The Proponent should consult with the MWRA to determine whether an 8(m) Permit is required to build, construct, excavate, or cross within MWRA infrastructure.**

The Proponent is coordinating with the MWRA regarding water supply impacts (see Section 9.2).

MEPA 56 **The DEIR should identify and describe commitments to water conservation and estimate associated decreases in demand. The hotels, in particular, provide numerous opportunities to reduce daily water demand by guests including the use of low-flow fixtures, modifications or the use of BMPs associated with laundry and food services, and guest education. Comments from BWSC recommend that timers, soil moisture indicators, and rainfall sensors be installed in any in-ground sprinkler systems. The DEIR should explore opportunities for greywater recycling for use in sanitary facilities, irrigation, or ornamental uses (e.g., fountains). The DEIR should provide an analysis of potential water supply demand reductions that may be achieved through the implementation of greywater recycling infrastructure and feasibility of implementing such a system.**

As described in the response to MEPA 54, the Project includes three large rainwater reuse tanks that will save approximately 4.5 million gallons of water per year (see Section 9.0). Sections 4.4 and 4.5 describe methods to minimize site irrigation as well as stormwater re-use for irrigation. Potable water demand in the facility itself will be reduced via the use of low-flow fixtures and waterless fixtures: low-flow fixtures will be used throughout the facility, including in hotel guest rooms; waterless urinals will be used in public spaces in the podium.

MEPA 57 **Comments from MassDEP and BWSC indicate that the DEIR should include revised wastewater flow projections. Projections should be developed consistent with 314 CMR 7.15 or 310 CMR 15.203 (2)-(5). Existing flows that will be maintained may be evaluated using existing meter data. The DEIR should detail the method for projecting wastewater flows.**

Revised wastewater calculations, consistent with 310 CMR 15, are included in Section 9.1, which also describes the methodology used to calculate the Resort's estimated wastewater generation.

MEPA 58 **The DEIR should include updated projections of wastewater generation, describe existing and proposed wastewater infrastructure for the entire site (including the horse barns), and identify measures to minimize wastewater demand and mitigate Project impacts.**

Section 9.1 describes the wastewater design for the site, which is intended to reduce water demand and, therefore, wastewater generation. The Proponent will continue to work with BWSC and the MWRA regarding wastewater generation and mitigation.

MEPA 59 **In the event that any new releases are discovered during demolition or construction, the status of the release in accordance with the MCP should be identified in the DEIR.**

The Proponent will comply with any MCP requirements, including any new releases that may be discovered during demolition or construction.

MEPA 60 **Comments from MHC request that information to assist it in evaluating potential impacts of the Project be provided prior to the filing of the DEIR. This includes an updated MHC Form A (Area Form) supported by current color photographs of all extant buildings and features and identification of the dates of construction and alterations if available. In addition, MHC indicates that the DEIR should clearly identify any and all potential alterations to the Revere Beach Parkway (REV.H), which is listed in the State and National Registers of Historic Places.**

An updated MHC Form A was submitted to the MHC and BLC on July 2, 2013. A copy of the inventory form is included as Attachment J. Potential alterations to the Revere Beach Parkway associated with the Project are described in Sections 5.0 and are included in Attachment A.

MEPA 61 **The EIR should include a discussion of construction phasing, evaluate potential impacts associated with construction activities (including but not limited to noise, vibration, dust, and traffic flow disruptions) and propose feasible measures to avoid or eliminate these impacts. The phasing plan should identify whether racetrack operations will continue during construction and, if so, how parking and other needs will be accommodated during construction.**

Construction phasing and potential impacts associated with construction activities and operational measures to mitigate those impacts are described in the Draft CMP in Attachment L.

MEPA 62 **The ENF indicates that a draft CMP will be included in the DEIR.**

The Draft CMP in Attachment L describes construction-period activities and considerations.

MEPA 63 **I note that the Project will result in the generation of demolition waste, portions of which will contain asbestos. Removal or abatement of regulated asbestos-containing material must be completed consistent with the requirements of 310 CMR 7.15 and the Proponent must provide an asbestos notification form (ANF 001) to MassDEP.**

The Proponent is familiar with the requirements for removing or abating regulated asbestos-containing material, and will comply with these requirements.

MEPA 64 **The ENF indicates that the construction waste management plan will include a minimum reuse/recycling goal of 75%. The DEIR should indicate whether a BUD will be required for any proposed reuse/recycling.**

Demolition of the existing administrative building, electrical building, and portions of the grandstand and link buildings will generate asphalt, brick, and concrete (ABC) debris. ABC that is not coated, impregnated, or otherwise treated will be crushed and reused on-site, an activity that does not require MassDEP pre-approval provided that MassDEP and the municipalities are notified in advance. However, for ABC that is painted, coated, impregnated, or otherwise treated, the contractor will submit a BUD application to MassDEP for approval for crushing and reuse. The application will be supported by documentation demonstrating that the material will be beneficially used on site and that use of the material will not result in a significant risk to health or the environment and will not increase the overall level of contamination at the site.

MEPA 65 **Because the Project is located adjacent to residential areas, I encourage the Proponent to mitigate the construction-period impacts of diesel emissions to the maximum extent feasible. This mitigation may be achieved through the installation of after-engine emission controls such as DOCs or DPFs, or the use of equipment that meets Tier 3 or Tier 4 emission standards for non-road construction equipment. Comments from MassDEP note that Project contractors are required to use ultra low sulfur diesel (ULSD) fuel (15 ppm sulfur) in off-road engines and provide additional resources to assist with implementation of this program. The DEIR should indicate measures that will be incorporated into the Project.**

Construction air quality, including the mitigation of diesel emissions, is discussed in the Draft CMP in Attachment L.

MEPA 66 **The DEIR should include a separate chapter that identifies all mitigation measures. This chapter should also include separate draft Section 61 Findings for each State Agency that will issue permits for the Project. The draft Section 61 Findings should contain clear commitments to implement mitigation measures, estimate the individual costs of each proposed measure, identify the parties responsible for implementation, and include a schedule for implementation.**

Section 10.0 summarizes the proposed mitigation measures and contains proposed Section 61 Findings for each State Agency that will issue a permit(s) for the Project.

MEPA 67 **The DEIR should contain a copy of this Certificate and a copy of each comment letter received. To ensure that the issues raised by commenters are addressed, the DEIR should include responses to comments.**

This section contains copies of the Certificate and all comment letters received on the ENF, and all comments are addressed herein.

MEPA 68 **The Proponent should circulate the DEIR to the individuals and organizations who commented on the ENF, to any State Agencies from which the Proponent will seek permits or approvals, and to any parties specified in section 11.16 of the MEPA regulations. In addition, the DEIR should be made available for review at the Boston Public Library (BPL), the East Boston Branch of the BPL, and the Revere Public Library.**

The Circulation List provided as Attachment M conforms to these requirements.

RE: Boston/Revere
Caesars Resort at Suffolk Downs
Suffolks Downs Racecourse
Route 1A Tomasello Drive
EEA # 15006

Attn: MEPA Unit

Dear Secretary Sullivan:

The Massachusetts Department of Environmental Protection (MassDEP) has reviewed the Environmental Notification Form (ENF) submitted by Sterling Suffolk Racecourse, LLC to construct a resort casino on the 161 acre, Suffolk Downs Racetrack property in Boston and Revere (EEA #15006). The site is bisected by the Rumney Marshes Area of Critical Environmental Concern (ACEC), which extends along Sales Creek. The casino will comprised of up to 450 hotel rooms in two hotels; multi-purpose meeting space; approximately 16 restaurants; 200,000 square feet (sf) of gaming space; 30,000 sf of retail space; and parking that includes a seven-story parking garage with about 2,600 spaces, valet parking for 450 vehicles, and 2,100 surface parking spaces. The Suffolk Downs Grandstand building will be repurposed to support one of the casino areas. The entire project is estimated at 1,802,363 sf in several linked buildings, and it exceeds several MEPA thresholds, which make the project categorically included for the preparation of an environmental impact report. MassDEP provides the following comments.

Wastewater

The ENF states that there is sufficient capacity in the existing collection system to accommodate the estimated 307,080 gallons per day (gpd) of new wastewater flow, which will increase the wastewater discharge to 473,100 gpd from the project site. Since new flows from the site will be greater than 50,000 gpd, a sewer extension/connection permit will be required. Additional information on the sewer extension and connection regulations is available on the MassDEP website: http://www.mass.gov/dep/service/regulations/314cmr07.pdf. Flows from the entire project must be included in the MassDEP Sewer Connection Permit Application. Wastewater generated by the project will discharge into the City of Boston's sewer system and ultimately flow to the MWRA's Deer Island Wastewater Treatment Facility. The wastewater flow generation estimation should be expanded from the information provided in the **DEP 01**

ENF. Wherever possible, the flow generation numbers noted in 314 CMR 7.15 or 310 CMR 15.203(2) – (5) should be used as design flows. In this regard, the estimate for theatre seats should be five gallons per day (gpd)/seat and not three gpd/seat, as noted in the ENF. Flows from existing areas which are to remain may be estimated using existing water meter data. Future flows which are not encompassed in the regulations cited above should be based on best engineering judgment, and typically can be determined utilizing 200 percent of the average daily flows using actual data from similar facilities. The method used to produce flow estimates must be detailed in the DEIR.

MassDEP collaborates with the MWRA and its member communities, (including Boston), in implementing a flow control program in the MWRA regional wastewater system to remove extraneous clean water, which is referred to as infiltration/inflow (I/I) from the sewer system. Proponents adding significant new wastewater flow participate in the I/I reduction effort to ensure that the additional wastewater flows from their projects are offset by the removal of I/I, which is typically at a rate of four gallons of I/I removed for every gallon of wastewater added. In accordance with the provisions of the MassDEP policy on I/I mitigation requirements in MWRA communities, (available at http://www.mass.gov/dep/water/laws/mwraii09.pdf), I/I mitigation is a required element of a MassDEP sewer connection permit for projects which generate greater than 15,000 gallons per day of wastewater flow where a project exceeds any MEPA threshold for an DEIR or if the project has a significant risk of creating conditions leading to a sanitary sewer overflow. Given the scope and impacts of the proposed project, and the need for I/I mitigation, the proponent should arrange to meet with MassDEP and the cities of Boston and Revere to develop a plan to meet the mitigation requirements of the MassDEP I/I Policy. **DEP 02**

Chapter 91, Waterways Licensing

The ENF suggests that no Chapter 91 license is required for the project because it is not located on jurisdictional tidelands. This view is consistent with a prior opinion from MassDEP in June, 2000, that found the tidelands on the site are non-jurisdictional because they are landlocked tidelands in accordance with the definition of that term in the waterways regulations at 310 CMR 9.02. The Department has confirmed the conclusion of the 2000 correspondence through a careful review of previous Chapter 91 licenses, dating back to the late 1800's, that were issued for the filling of tidelands, installation of tidegates, and creation of drainage features at and adjacent to the project site.

While projects on landlocked tidelands are not subject to licensing, they are required to seek a Public Benefits Determination by the Secretary. According to the ENF, the DEIR will include more information regarding the projects benefits to public trust rights in tidelands. The Department will review and comment upon the DEIR's discussion of the public benefits provided by the project.

Wetlands

MassDEP requests a description of the wetland resources onsite and off-site where project-related work or mitigation is proposed. The DEIR should quantify the extent of unavoidable wetland alteration, including both temporary and permanent impacts. Plans at a readable scale should show the boundaries of all wetland resource areas and areas to be altered. **DEP 03**

The proposal also should explain how the project will comply with the applicable performance standards as required in the wetlands regulations and demonstrate that wetland alteration has been avoided and minimized to the extent feasible through preparation of an alternatives analysis (see 310 CMR 10.55(4)). Where opportunities exist, revised site designs should be considered in order to avoid and minimize wetland impacts. The proposal should include plans depicting and quantifying wetlands replication areas and information on how altered wetland functions will be restored.

According to the ENF, the project will fill 480,000 square feet (sf) of Bordering Land Subject to Flooding (BLSF), and this loss will be compensated with 140,000 cubic feet (cf) of compensatory flood storage. The areas of impact and compensation will need to be shown on plans at a readable scale. Compensatory flood storage must be provided at an incremental basis, in accordance with the performance standards under 310 CMR 10.57(4). **DEP 04**

In addition, off-site work relating to the project would alter 40,000 sf of Land Subject to Coastal Storm Flowage (LSCSF). This area also needs to be shown on the project plans. MassDEP also requests a full description of this floodplain area and an explanation for classifying this area as LSCSF, rather than BLSF.

Stormwater

A new stormwater drainage system is proposed for the two casino areas, parking garage, and surface parking areas. As explained in the ENF, the stormwater system for the CAFO operations in the northern and northeastern portions of the site is expected to remain as is.

According to the ENF, the Redevelopment Standard 7 in the MassDEP stormwater management regulations (SMR), (310 CMR 10.05(6)(k)), is applicable to the project. This standard allows the proponent to demonstrate that the standards have been met "to the maximum extent practicable," where it is not feasible to comply with the standards fully. However, this is a largely underdeveloped project site that includes the Rumney Marshes ACEC, and the nearby waterbodies are impaired, such that total maximum daily loads (TMDL) are needed and a draft pathogen TMDL has been established. Therefore, MassDEP strongly encourages the proponent to evaluate stormwater management designs in the DEIR that fully comply with the SMR performance standards in order to protect the ACEC and conform to the goals established in the pathogen TMDL. The project has an opportunity and obligation to contribute toward the ongoing revitalization of this significant natural resource, which notably received one million dollars last year from the U.S Fish and Wildlife Service (USFWS) National Coastal Wetland Conservation Grant Program (NCWCG) to restore 33 acres of the 2,000 acre Rumney Marsh, the largest contiguous salt marsh habitat in the Boston metropolitan area. **DEP 05**

As specified for redevelopment in the *Stormwater Management Handbook Volume 1*, a demonstration of "to the maximum extent practicable" entails a demonstration that all reasonable efforts have been made to comply with the standards, including considering on and off-site alternatives. "The scope and effort to be undertaken to meet the standards should reflect the scale and impacts of the proposed project and the classification and sensitivity of the affected wetlands and water resources." Conventional best management practices (BMPs) and low impact

development techniques are proposed for compliance with the applicable performance standards. Currently, there are no detailed stormwater management plans in the ENF.

The DEIR should demonstrate that the project's water quality and quantity impacts would be controlled with best management practices (BMPs) to comply with SMR standards and for consistency with the applicable Storm Water Programs under the NPDES Phase I and Phase II Stormwater General Permits for MassDOT and the cities of Boston and Revere. These state and local stormwater management programs have requirements and implementation strategies to control the release of pollutants in stormwater runoff to impaired waterbodies with total maximum daily loads (TMDLs). As there is a *Draft Pathogen TMDL for the Boston Harbor Watershed (excluding the Neponset River sub-basin)* for impaired and non-impaired waterbodies in the vicinity of the project site, the stormwater management study should consider how stormwater controls conform to the TMDL and associated implementation strategies established for pathogens. In general, the MassDEP report, *Mitigation Measures to Address Pathogen Pollution in Surface Water: A TMDL Implementation Guidance Manual for Massachusetts,* recommends the use of infiltration BMPs to control pathogens. "Given the high concentrations of bacteria often found in stormwater and the lack of targeted mitigation measures, perhaps the most effective means of reducing stormwater contributions to pathogen impairment is to reduce the volume of runoff by increasing infiltration to groundwater." The DEIR should present a thoughtful analysis of the effectiveness of the stormwater management system in controlling the recognized water quality impairments, particularly pathogens, taking into consideration pollution prevention, source control, BMPs, and system maintenance. Additional information on pathogen mitigation is available in this report; it is available at the following MassDEP website: http://www.mass.gov/dep/water/resources/impguide.pdf. **DEP 06**

Stormwater runoff impacts during construction and post-construction will need to be evaluated in the DEIR, including off-site transportation mitigation and sewer-related work. It is anticipated that the stormwater management report will be sufficiently detailed to demonstrate that source controls, pollution prevention measures, erosion and sediment controls, and the post-development drainage system will be designed in compliance with the MassDEP stormwater management regulations, pursuant to 310 CMR 10.05(6)(k) and all applicable performance standards, including Standard 6 for Critical Areas such as ACECs, which are addressed in greater detail in the Stormwater Management Handbooks. **DEP 07**

The DEIR also should demonstrate that source controls, pollution prevention measures, erosion and sediment controls during construction, and the post-development drainage system will be designed to comply with the SMR and standards for water quality and quantity impacts and for consistency with the Storm Water Programs identified previously. Calculations, stormwater system design plans at a readable scale, best management practice (BMP) designs, and supporting information should demonstrate that the stormwater system design protects wetland resources in conformance with the stormwater regulations and NPDES permits. **DEP 08**

Low Impact Development

The proponent is considering low impact development (LID) and the use of integrated management practices (IMP) for control of stormwater in combination with conventional drainage control measures, as the SMR requires. The range of LID techniques offers a

stormwater management approach that minimizes runoff impacts by maintaining and mimicking existing hydrologic functions. LID can be less costly than conventional gutter and pipe drainage systems to construct and maintain. LID also can provide redundancy for stormwater control.

The current project layout reduces imperviousness by about nine acres, which downsizes the volume of stormwater that will need to be controlled and may allow infiltration of rainwater to limit the release of contaminants from the site into nearby marshland and waterbodies. Currently 71 acres of the 161 acre site are impervious, with 90 acres considered pervious. This project also is suitable for other low impact development (LID) stormwater control strategies and practices. For example, flat-roof buildings could be vegetated as green roofs, and pervious pavement could be used for low intensity parking areas and sidewalks on site. There also may be an opportunity to add raingardens/bioretention areas and tree box filters for enhanced stormwater infiltration in open space and landscaped strips. Additional information on LID practices with high environmental performance efficiencies is available on the following USEPA website: www.epa.gov/nps/lid. **DEP 09**

Greenhouse Gas Emissions (GHG)

According to the ENF, the project "will set a new standard of excellence in sustainable design..." for similar facilities. The goal for this project is the US Building Council's Leadership in Energy and Environmental Design (LEED) Gold rating. The project will need to comply with the City of Boston's Article 37 Zoning Ordinance and the applicable Stretch Building Code, which is being revised and expected to take effect either this year or 2014. It is anticipated that the DEIR will describe the design measures that will adopted to achieve at least these standards, in addition to providing a full analysis of mobile and stationary sources of greenhouse gas emissions. The proposed project is subject to the *MEPA Greenhouse Gas Emissions Policy and Protocol (Policy)* as amended on May 5, 2010. **DEP 10**

The policy requires energy modeling to quantify projected energy consumption and the related GHG emissions from direct and indirect stationary sources, and to evaluate the energy efficient design alternatives that will be incorporated into the project to reduce greenhouse gas emissions. The policy allows the proponent to select a model; however, MassDEP and DOER recommend using EQUEST for stationary source modeling. The DEIR should include the modeling printout for at least three scenarios: base case, preferred alternative case, and preferred alternative with greater GHG mitigation case. In addition, the DEIR should include emission tables that compare base case emissions in tons with the mitigation alternatives showing the reduction in tons and percentage by emissions source, direct, indirect and transportation. Other tables or graphs that show the tonnage and percentage reduction of major mitigation elements are also very useful in comparing the value added of different measures. The DEIR should explain, in reasonable detail, any measure not selected that has the potential to significantly reduce GHG emissions. At this stage of the MEPA review, the proponent anticipates that the project would include high efficiency chillers, condensing boilers, water and airside economizers, heat recovery, high efficiency lighting, lighting controls, and water conserving plumbing fixtures. **DEP 11** **DEP 12** **DEP 13**

The Massachusetts Clean Energy and Climate Plan 2020 estimates that MEPA project reviews will contribute by reducing approximately 100,000 Metric Tons of CO_2 equivalent by 2020. Significant projects, such as Caesars Resort are integral to the achievement of this goal.

Therefore, MassDEP encourages the proponent to adopt cutting-edge energy efficient designs and equipment wherever feasible, taking into consideration that energy efficient designs yield cost-savings over time.

At this early planning stage, the proponent is evaluating on-site anaerobic digestion (AD) to reduce organic waste from the casino and racetrack, which can generate an alternative fuel source for the project. In addition, photovoltaics (PV), green roofs, and combined heat and power (CHP) will be given consideration. The DEIR should layout information and plans to understand the feasibility of incorporating renewable energy into the project design. Should a renewable energy option be infeasible, it is requested that the DEIR provide an explanation and a thoughtful discussion of the changes that would be needed for reconsideration of that alternative. **DEP 14**

MassDEP is very supportive of CHP for this project, in light of the information provided by USEPA on CHP and casinos, such as the USEPA factsheet and market analysis, which are available at the following websites: http://www.epa.gov/chp/markets/casino_fs.html and http://www.epa.gov/chp/documents/hotel_casino_analysis.pdf, respectively. According to USEPA, CHP is a viable option for a significant number of large hotels and casinos; CHP typically supplies 50 to 70 percent of the electricity needed. As the proponent proceeds with the technical and economic feasibility evaluation, it may be helpful to consult the CHP Partnership, an organization that assists with the design process and to identify financing options and other services that can be accessed through the USEPA website: http://www.epa.gov/chp/. In addition, MassDEP has promulgated regulations to encourage the installation of CHP systems. These regulations may be found at 310 CMR 7.26(45) Combined Heat and Power (CHP). **DEP 15**

Anaerobic Digestion(AD) to Energy

MassDEP supports the proponent's efforts to evaluate AD as an energy source for this project and requests that the DEIR describe and provide plans for an AD system, or alternative AD systems that would utilize available resources to meet the project's energy needs. The potential for GHG emissions reductions from an alternative fuel should be considered in the DEIR. **DEP 16**

In terms of air quality permitting, the proponent has the option of either complying in full with the MassDEP regulations for engines and turbines in 310 CMR 7.26(43), or alternatively, complying with the Best Available Control Technology (BACT) requirements in 310 CMR 7.02(5). The engine and turbine regulations apply to engines that have a power output rating equal to or greater than 50kW and turbines with a rated power output less than or equal to ten MW.

If the alternative approach and BACT is selected, the requirements for top-case BACT are explained in the commercial AD BACT Guidance document, entitled *Current Best Available Control Technology (BACT) Requirements,* which is available at the following MassDEP website: http://www.mass.gov/dep/air/approvals/bactadc.pdf. In addition, detailed information on the Air Quality (AQ) Plan Approval process, as well as the AQ forms that would be needed in order to obtain a written AQ Plan Approval are available on the following MassDEP website: http://www.mass.gov/dep/air/approvals/aqforms.htm#airpapp.

In addition, with respect to any proposed AD component of the project, the DEIR should discuss the applicability of MassDEP's regulations promulgated in November 2012 for the purpose of building capacity for managing organic materials (310 CMR 16.00, 310 CMR 19.00 & 314 CMR 12.00). These regulatory amendments were developed to address barriers to the development of certain types of recycling, composting, and other clean/green cutting edge technologies in the Commonwealth, such as AD. The regulatory changes were created to bring the regulations up-to-date with innovative clean energy technologies by establishing a clear permit pathway for these activities; thereby facilitating siting of these projects and ensuring that high environmental standards are met. Among other things, these regulations exempt certain activities from solid waste site assignment requirements and set forth a straightforward pathway for permitting certain recycling, composting, and conversion (RCC) activities.

MassDEP is available to hold pre-application meetings with the proponent in order to fully answer any technical questions concerning regulatory requirements for AD, and to describe the best path to take to fulfill the regulatory requirements expeditiously. However, in the event that an AD system is found to be infeasible for the project, MassDEP requests that the DEIR provide an organics management plan for the project. **DEP 17**

Air Quality

The ENF estimates that the project will generate 24,600 new vehicle trips per day based on a preliminary analysis which will be refined in the Draft Environmental Impact Report (DEIR). Nevertheless, it is anticipated that the final, new vehicle trip projection will exceed MassDEP's review threshold of 3,000 daily trips for mixed use development requiring an air quality mesoscale analysis of project related emissions. The purpose of the mesoscale analysis is to determine to what extent the proposed project trip generation will increase the amount of volatile organic compounds (VOCs) and nitrogen oxides (NOx) in the project study area. The proposed project also is subject to the MEPA Greenhouse Gas Emissions Policy and Protocol (Policy) as amended on May 5, 2010. The Policy requires the project proponent to quantify project-related carbon dioxide (CO_2) emissions and identify measures to avoid, minimize, and mitigate these emissions. The mesoscale analysis also should be used for this purpose. The analysis must compare the indirect emissions from transportation sources under future No Build, Build, and Build with Mitigation conditions. Subsequent environmental filings should include the results of the mesoscale analysis for VOC, NOx, and CO2 emissions under these conditions. **DEP 18**

MassDEP supports the proponent's commitment to collaborate with the MBTA to enhance transit service to the site and to mitigate the impacts of the project-related traffic through a combination of local and regional roadway improvements, transportation demand management (TDM), and parking management.

Enhanced Transit Service

The project site enjoys excellent transit connections with nearly direct access via Suffolk Downs and Beachmont Blue Line Stations, local bus service, and limited express bus service. MassDEP recommends that the proponent exploit the potential of this transit-rich location by promoting transit service to the project site from neighboring communities, Logan Airport, Downtown, and the Seaport District. Accordingly, the DEIR should explore all reasonable opportunities for trip reduction and management tailored to the specific needs of employees and **DEP 19**

patrons with particular emphasis on transit connections as well as bicycle and pedestrian infrastructure and amenities. MassDEP recommends that the project proponent consider the following three actions: **DEP 20**

- Work closely with the MBTA to consider adding an on-site bus stop for the Express Bus Routes 424, 434, 448, and 449 for increased transit service to the site.
- Maintain the existing Suffolk Downs shuttle service to adjacent Blue Line stations and expand the shuttle service as necessary to accommodate additional Blue Line ridership to the project site.
- Offer active support for any future consideration to expand the Silver Line into East Boston and Chelsea. Should the Hubway bike share program expand into East Boston, MassDEP recommends the proponent support an on-site docking station.

MassDEP encourages the proponent to explore these and other opportunities for trip reduction and management and recommends that the DEIR includes greater emphasis on pedestrian and bicycle measures that take advantage of the project's proximity to several transit options.

Recommended Mitigation Measures

In addition to MassDEP's aforementioned recommendations and the transit demand management (TDM) measures presented in the ENF, MassDEP recommends that the DEIR contain a greater emphasis on TDM and mitigation measures to reduce project related emissions, such as the following measures: **DEP 21**

- Provide market incentives that encourage patrons to seek travel by charter bus service rather than private automobile.
- Charge market price for parking spaces used by single occupant vehicle (SOV) drivers. Proponents can charge a fee to those who drive alone, while keeping parking free for bus, transit, carpool or vanpool.
- Offer parking cash-out incentives to employees whose parking is provided. This strategy encourages employers/tenants to provide employees with an option for compensation for not utilizing dedicated parking spaces, thus encouraging employees to seek alternative modes of transportation such as walking, biking, carpooling, or taking public transit to work.
- Provide expanded private shuttle service to transit connections for both employees and patrons.
- Improve proposed bicycle parking by providing short and long term accommodations, as appropriate, for project employees and patrons. Bicycle parking should be secure, convenient, weather protected, and sufficient to meet demand.
- Work with Boston officials to support and fund as necessary, off-site, improved bicycle access to the project site, including the use of the most recent MassDOT Design Guidelines or engineering judgment, as appropriate.
- Offer Alternative Work Schedules to all employees as well as staggered work shifts, where appropriate, to reduce peak period traffic volumes.
- Provide Direct Deposit for employees.

- Participate in the USEPA SmartWay Transport Program. SmartWay is a voluntary program that increases energy efficiency and reduces greenhouse gas emissions.
- Provide Guaranteed Ride Home to those employees who regularly commute by transit, bicycle, or vanpool to the site and who have to leave work in the event of a family emergency or leave work late due to unscheduled overtime.
- Establish infrastructure that provides publicly available electric vehicle charging facilities.
- Provide electronic signage displaying shuttle and transit schedule information.
- Dedicate space for Car Sharing/Bike Sharing. The proponent should dedicate a minimum of two car sharing spaces in the proposed garage. MassDEP recommends the proponent provide support and dedicated space for bike sharing on site as this concept expands into the area.
- Hire an Employee Transportation Coordinator to administer the parking management program. A Coordinator can act as a point of contact for the various tenants within a given development, help enforce the parking requirements, and carry out any other day-to-day tasks and strategies from the rest of the list above.
- Unbundle hotel guest parking fees from accommodation rates, thus encouraging alternative travel mode choice.
- Provide preferential and free parking for guests using carpools.
- Explore shared parking opportunities to take advantage of the varying parking demand periods of nearby facilities.

Recommended Construction Period Air Quality Mitigation Measures

Diesel emissions contain fine particulates that exacerbate a number of heath conditions, such as asthma and respiratory ailments. MassDEP recommends that the proponent work with its staff to implement construction-period diesel emission mitigation, which could include the installation of after-engine emission controls such as oxidation catalysts or diesel particulate filters, or the use of construction equipment that meet Tier 3 or Tier 4 emission standards for non-road construction equipment. Additional information is available on the MassDEP website: http://www.mass.gov/dep/air/diesel/conretro.pdf. In addition, project contractor(s) are required to use ultra low diesel fuel (ULSD) in their off-road construction equipment in conjunction with after-engine emission controls. **DEP 22**

Required Mitigation Measures: Compliance with the Massachusetts Idling Regulation

The ENF acknowledges the Massachusetts Idling regulation (310 CMR 7.11) which prohibits motor vehicles from idling their engines more than five minutes unless the idling is necessary to service the vehicle or to operate engine-assisted power equipment (such as refrigeration units) or other associated power. The DEIR should address how the project will ensure compliance with the regulation. Questions regarding this regulation should be directed to Julie Ross of MassDEP at 617-292-5958. **DEP 23**

Recycling Issues

MassDEP acknowledges the proponent's commitment to recycle and reuse as much of the construction and demolition (C&D) waste as feasible. The proponent also should be aware of

that certain materials are restricted from disposal, pursuant to 310 CMR 19.017 and that demolition activities must comply with both Solid Waste and Air Pollution Control regulations, pursuant to M.G.L. Chapter 40, Section 54, which provides:

"Every city or town shall require, as a condition of issuing a building permit or license for the demolition, renovation, rehabilitation or other alteration of a building or structure, that the debris resulting from such demolition, renovation, rehabilitation or alteration be disposed of in a properly licensed solid waste disposal facility, as defined by Section one hundred and fifty A of Chapter one hundred and eleven. Any such permit or license shall indicate the location of the facility at which the debris is to be disposed. If for any reason, the debris will not be disposed as indicated, the permittee or licensee shall notify the issuing authority as to the location where the debris will be disposed. The issuing authority shall amend the permit or license to so indicate."

For the purposes of implementing the requirements of M.G.L. Chapter 40, Section 54, MassDEP considers an asphalt, brick, and concrete (ABC) rubble processing or recycling facility, (pursuant to the provisions of Section (3) under 310 CMR 16.05, the Site Assignment regulations for solid waste management facilities), to be conditionally exempt from the site assignment requirements, if the ABC rubble at such facilities is separated from other solid waste materials at the point of generation. In accordance with 310 CMR 16.05(3), ABC can be crushed on-site with a 30-day notification to MassDEP. However, the asphalt is limited to weathered bituminous concrete, (no roofing asphalt), and the brick and concrete must be uncoated or not impregnated with materials such as roofing epoxy. If the brick and concrete are not clean, the material is defined as construction and demolition (C&D) waste and requires either a Beneficial Use Determination (BUD) or a Site Assignment and permit before it can be crushed.

Pursuant to the requirements of 310 CMR 7.02 of the Air Pollution Control regulations, if the ABC crushing activities are projected to result in the emission of one ton or more of particulate matter to the ambient air per year, and/or if the crushing equipment employs a diesel oil fired engine with an energy input capacity of three million or more British thermal units per hour for either mechanical or electrical power which will remain on-site for twelve or more months, then a plan application must be submitted to MassDEP for written approval prior to installation and operation of the crushing equipment.

In addition, if significant portions of the demolition project contain asbestos, the project proponent is advised that asbestos and asbestos-containing waste material are a special waste as defined in the Solid Waste Management regulations, (310 CMR 19.061). Asbestos removal notification on permit form ANF 001 and building demolition notification on permit form AQ06 must be submitted to MassDEP at least 10 working days prior to initiating work. Except for vinyl asbestos tile (VAT) and asphaltic-asbestos felt and shingles, the disposal of asbestos containing materials within the Commonwealth must be at a facility specifically approved by MassDEP, (310 CMR 19.061). No asbestos containing material including VAT, and/or asphaltic-asbestos felts or shingles may be disposed at a facility operating as a recycling facility, (310 CMR 16.05). The disposal of the asbestos containing materials outside the jurisdictional boundaries of the Commonwealth must comply with all the applicable laws and regulations of the state receiving the material.

The demolition activity also must conform to current Massachusetts Air Pollution Control regulations governing nuisance conditions at 310 CMR 7.01, 7.09 and 7.10. As such, the proponent should propose measures to alleviate dust, noise, and odor nuisance conditions, which may occur during the demolition. Again, MassDEP must be notified in writing, at least 10 days in advance of removing any asbestos, and at least 10 days prior to any demolition work. The removal of asbestos from the buildings must adhere to the special safeguards defined in the Air Pollution Control regulations, (310 CMR 7.15 (2)). **DEP 24**

The proponent's record for its comprehensive recycling programs should be emulated and expanded in Massachusetts. In addition to paper, glass, plastics, waste oil, and cardboard, MassDEP would appreciate and encourage a commitment to innovative recycling of the waste stream, characteristic of a resort casino, such as is being done with gently-used soap and personal care products. Facilitating future waste reduction and recycling and integrating recycled materials into the project are necessary to minimize or mitigate the long-term solid waste impacts of this type of development. The Commonwealth's waste diversion strategy is part of an integrated solid waste management plan, contained in The Solid Waste Master Plan that places a priority on source reduction and recycling. Efforts to reduce waste generation and promote recycling have yielded significant environmental and economic benefits to Massachusetts' residents, businesses and municipal governments over the last ten years. Waste diversion will become even more important in the future as the key means to conserve the state's declining supply of disposal capacity and stabilize waste disposal costs. **DEP 25**

In revising the Solid Waste Master Plan, MassDEP is advancing a goal to divert 450,000 tons of food waste from landfills and incinerators by 2020. In the future, large-scale food waste generators, which may include Caesar's Resort, will be banned from landfilling or incinerating food waste. Therefore, MassDEP strongly encourages the proponent to move forward with plans for anaerobic digestion (AD) on-site. If this is infeasible, an alternative AD facility and/or composting facility should be considered for the project's organic waste. **DEP 26**

As the lead state agencies responsible for helping the Commonwealth achieve its waste diversion goals, MassDEP and EEA have strongly supported voluntary initiatives by the private sector to institutionalize source reduction and recycling into their operations. Adapting the design, infrastructure, and contractual requirements necessary to incorporate reduction, recycling and recycled products into existing large-scale developments has presented significant challenges to recycling proponents. Integrating those components into developments such as the Caesars Resort at Suffolk Downs project at the planning and design stage enable the project's management and occupants to establish and maintain effective waste diversion programs. For example, facilities with minimal obstructions to trash receptacles and easy access to main recycling areas and trash chutes allow for implementation of recycling programs and have been proven to reduce cleaning costs by 20 percent to 50 percent. Other designs that provide sufficient space and electrical services will support consolidating and compacting recyclable material and truck access for recycling material collection.

By incorporating recycling and source reduction into the design, the proponent has the opportunity to join a national movement toward sustainable design. Sustainable design was endorsed in 1993 by the American Institute of Architects with the signing of its *Declaration of*

Interdependence for a Sustainable Future. The project proponent should be aware there are several organizations that provide additional information and technical assistance, including Recycling Works in Massachusetts, the Chelsea Center for Recycling and Economic Development, and MassRecycle.

Massachusetts Contingency Plan/M.G.L. c.21E

Contaminated Soil and Groundwater: The ENF has identified 1 contamination sites assigned to release tracking numbers, including: RTN 3-14857 (RAO B-1). The project proponent is advised that excavating, removing and/or disposing of contaminated soil, pumping of contaminated groundwater, or working in contaminated media must be done under the provisions of MGL c.21E (and, potentially, c.21C) and OSHA. If permits and approvals under these provisions are not obtained beforehand, considerable delays in the project can occur. The project proponent cannot manage contaminated media without prior submittal of appropriate plans to MassDEP, which describe the proposed contaminated soil and groundwater handling and disposal approach, and health and safety precautions. Because contamination at the site is known or suspected, the appropriate tests should be conducted well in advance of the start of construction and professional environmental consulting services should be readily available to provide technical guidance to facilitate any necessary permits. If dewatering activities are to occur at a site with contaminated groundwater, or in proximity to contaminated groundwater where dewatering can draw in the contamination, a plan must be in place to properly manage the groundwater and ensure site conditions are not exacerbated by these activities. Dust and/or vapor monitoring and controls are often necessary for large-scale projects in contaminated areas. The need to conduct real-time air monitoring for contaminated dust and to implement dust suppression must be determined prior to excavation of soils, especially those contaminated with compounds such as metals and PCBs. An evaluation of contaminant concentrations in soil should be completed to determine the concentration of contaminated dust that could pose a risk to health of on-site workers and nearby human receptors. If this dust concentration, or action level, is reached during excavation, dust suppression should be implemented as needed, or earthwork should be halted. **DEP 27** **DEP 28** **DEP 29**

Potential Indoor Air Impacts: Parties constructing and/or renovating buildings in contaminated areas should consider whether chemical or petroleum vapors in subsurface soils and/or groundwater could impact the indoor air quality of the buildings. All relevant site data, such as contaminant concentrations in soil and groundwater, depth to groundwater, and soil gas concentrations should be evaluated to determine the potential for indoor air impacts to existing or proposed building structures. Particular attention should be paid to the vapor intrusion pathway for sites with elevated levels of chlorinated volatile organic compounds such as tetrachloroethylene (PCE) and trichloroethylene (TCE). MassDEP has additional information about the vapor intrusion pathway on its website at http://www.mass.gov/dep/cleanup/laws/vifs.htm. **DEP 30**

New Structures and Utilities: Construction activities conducted at a disposal site shall not prevent or impede the implementation of likely assessment or remedial response actions at the site. Construction of structures at a contaminated site may be conducted as a Release Abatement Measure if assessment and remedial activities prescribed at 310 CMR 40.0442(3) are completed within and adjacent to the footprint of the proposed structure prior to or concurrent

with the construction activities. Excavation of contaminated soils to construct clean utility corridors should be conducted for all new utility installations.

The MassDEP appreciates the opportunity to comment on this proposed project. Please contact Jerome.Grafe@state.ma.us at (617) 292-5708 for mobile source air quality impacts, Rachel.Freed@state.ma.us at (978) 694-3258 Kevin.Brander@state.ma.us at (978) 694-3236 for further information on the wastewater issues, James.Belsky@state.ma.us, at (978) 694-3288 for issues relating to air quality plan approval, and Alex.Strysky@state.ma.us at (617) 292-5616 for issues relating to the Chapter 91, waterways license. If you have any general questions regarding these comments, please contact Nancy.Baker@state.ma.us, MEPA Review Coordinator at (978) 694-3338.

Sincerely,

John D. Viola
Deputy Regional Director

MASSACHUSETTS DEPARTMENT OF ENVIRONMENTAL PROTECTION

DEP 01 **The wastewater flow generation estimation should be expanded from the information provided in the ENF. Wherever possible, the flow generation numbers noted in 314 CMR 7.15 or 310 CMR 15.203(2) – (5) should be used as design flows. In this regard, the estimate for theatre seats should be five gpd/seat and not three gpd/seat, as noted in the ENF. Flows from existing areas which are to remain may be estimated using existing water meter data. Future flows which are not encompassed in the regulations cited above should be based on best engineering judgment, and typically can be determined utilizing 200 percent of the average daily flows using actual data from similar facilities. The method used to produce flow estimates must be detailed in the DEIR.**

Revised wastewater calculations, consistent with 310 CMR 15, are provided in Section 9.1, which also describes the methodology used to calculate the Resort's estimated wastewater generation.

DEP 02 **Given the scope and impacts of the proposed Project, and the need for I/I mitigation, the Proponent should arrange to meet with MassDEP and the cities of Boston and Revere to develop a plan to meet the mitigation requirements of the MassDEP I/I Policy.**

The Proponent has been coordinating with BWSC regarding mitigation for I/I. The entire wastewater collection system for the Project site will be replaced with a new wastewater collection and conveyance system, thereby reducing I/I to the maximum extent practicable (see Section 9.1). The Proponent will also confer with MassDEP and the City of Revere regarding I/I.

DEP 03 **MassDEP requests a description of the wetland resources onsite and off-site where Project-related work or mitigation is proposed. The DEIR should quantify the extent of unavoidable wetland alteration, including both temporary and permanent impacts. Plans at a readable scale should show the boundaries of all wetland resource areas and areas to be altered. The proposal also should explain how the Project will comply with the applicable performance standards as required in the wetlands regulations and demonstrate that wetland alteration has been avoided and minimized to the extent feasible through preparation of an alternatives analysis (see 310 CMR 10.55(4)). Where opportunities exist, revised site designs should be considered in order to avoid and minimize wetland impacts. The proposal should include plans depicting and quantifying wetlands replication areas and information on how altered wetland functions will be restored.**

On-site wetland resource areas delineated by Epsilon Associates, Inc. are described in Section 6.9.1. A more detailed description can be found in Attachment I. Off-site wetland resource areas evaluated by Vanasse Hangen Brustlin Inc. are described in Section 6.9.2.

The proposed alterations to RFA and BLSF on the Project site are described and quantified in Section 6.9.1. No other alterations to wetland resource areas on the Project site are proposed, including but not limited to BVW, Inland Bank, or LUW. Information demonstrating compliance with the applicable performance standards and measures designed to avoid or minimize wetland resource area impacts is provided in Section 6.9.

As described in Section 6.9.2 some of the off-site transportation improvement activities will occur in LSCSF and within RFA. Depending on feedback from MassDOT and pending final design, work along Lee Burbank Highway (Route 1A) could entail alteration of Salt Marsh and Coastal Bank. Section 6.9 contains additional detail on estimated and worst-case scenario alterations of off-site wetland resource areas as well as information demonstrating compliance with WPA regulations.

DEP 04 **According to the ENF, the Project will fill 480,000 square feet of BLSF, and this loss will be compensated with 140,000 cubic feet of compensatory flood storage. The areas of impact and compensation will need to be shown on plans at a readable scale ... In addition, off-site work relating to the Project would alter 40,000 square feet of LSCSF. This area also needs to be shown on the Project plans. MassDEP also requests a full description of this floodplain area and an explanation for classifying this area as LSCSF, rather than BLSF.**

Since the filing of the ENF, the proposed site plans have been refined and alterations to BLSF have been updated; approximately 615,000 square feet of BLSF will be altered on the Project site (see Section 6.9.1.2). As demonstrated in Section 6.9.1, compensatory flood storage will be provided for all flood storage volume that will be permanently lost as a result of the Project. The volume will be created in an area not previously used for flood storage and will be incrementally equal to the theoretical volume of flood water lost at each elevation, up to and including the 100-year flood elevation, which will be displaced by the Project.

With regard to off-site activities proposed in LSCSF that does not require compensatory flood storage, Table-6-35 and Section 6.9.2 provides detailed resource area impacts.

DEP 05 MassDEP strongly encourages the Proponent to evaluate stormwater management designs in the DEIR that fully comply with the stormwater management regulations' performance standards in order to protect the [Rumney Marshes] ACEC and conform to the goals established in the pathogen [TMDL].

The Project has been designed to meet MassDEP Stormwater Management Guidelines to the maximum extent practicable. Wherever practicable, the Project design meets the Standards. The Project design will ensure improvements in the quality and quantity of discharges to the Rumney Marshes ACEC, and the use of LID stormwater techniques will improve water quality by reducing pathogens, bacteria, phosphorus, and nitrogen in stormwater runoff (see Section 9.3).

DEP 06 The DEIR should demonstrate that the Project's water quality and quantity impacts would be controlled with BMPs to comply with stormwater management regulations standards and for consistency with the applicable Storm Water Programs under the NPDES Phase I and Phase II Stormwater General Permits for MassDOT and the cities of Boston and Revere... As there is a *Draft Pathogen TMDL for the Boston Harbor Watershed (excluding the Neponset River sub-basin)* for impaired and non-impaired Waterbodies in the vicinity of the Project site, the stormwater management study should consider how stormwater controls conform to the TMDL and associated implementation strategies established for pathogens... The DEIR should present a thoughtful analysis of the effectiveness of the stormwater management system in controlling the recognized water quality impairments, particularly pathogens, taking into consideration pollution prevention, source control, BMPs, and system maintenance.

The Project is being designed to be consistent with the NPDES Phase I and Phase II programs as well as the Draft Pathogen TMDL for Boston Harbor. The Project design incorporates LID drainage design measures that will improve water quality by reducing pathogens, bacteria, phosphorus, and nitrogen in stormwater runoff (see Section 9.3).

DEP 07 Stormwater runoff impacts during construction and post-construction will need to be evaluated in the DEIR, including off-site transportation mitigation and sewer-related work. It is anticipated that the stormwater management report will be sufficiently detailed to demonstrate that source controls, pollution prevention measures, erosion and sediment controls, and the post-development drainage system will be designed in compliance with the MassDEP stormwater management regulations, pursuant to 310 CMR 10.05(6)(k) and all applicable performance standards, including Standard 6 for Critical Areas such as ACECs...

Section 9.3 and the Stormwater Management Report address source controls, pollution prevention measures, erosion and sedimentation controls, and compliance with Stormwater Management Regulations.

DEP 08 **The DEIR should also demonstrate that source controls, pollution prevention measures, erosion and sediment controls during construction, and the post-development drainage system will be designed to comply with the stormwater management regulations and standards for water quality and quantity impacts and for consistency with the Storm Water Programs identified previously. Calculations, stormwater system design plans at a readable scale, BMP designs, and supporting information should demonstrate that the stormwater system design protects wetland resources in conformance with the stormwater regulations and NPDES permits.**

Attachment F contains a comprehensive drainage report that describes the proposed drainage system and its compliance with Stormwater Management Guidelines in detail. This report includes drainage area plans and calculations as well as a draft SWPPP. Section 9.3 describes stormwater management.

DEP 09 **The current Project layout reduces imperviousness by about nine acres... This Project is also suitable for other LID stormwater control strategies and practices. For example, flat-roof buildings could be vegetated as green roofs, and pervious pavement could be used for low-intensity parking areas and sidewalks on site. There also may be an opportunity to add raingardens/bioretention areas and tree box filters for enhanced stormwater infiltration in open space and landscaped strips.**

LID drainage BMPs are incorporated into the Project design to the maximum extent practicable. These measures include bioretention basins, biofiltration swales, pervious pavers in select plaza and pedestrian areas, and rainwater harvesting tanks (see Section 9.3).

DEP 10 **The goal for this Project is the USGBC's LEED Gold rating. The Project will need to comply with the City of Boston's Article 37 Zoning Ordinance and the applicable Stretch Building Code, which is being revised and expected to take effect either this year or 2014. It is anticipated that the DEIR will describe the design measures that will be adopted to achieve at least these standards, in addition to providing a full analysis of mobile and stationary sources of GHG emissions.**

The Project's status with respect to LEED and Article 37 are described in Section 2.2. The Stretch Code and related design measures that will result in compliance are addressed in Sections 7.2 and 7.3.1. Mobile source GHG analysis is presented in Section 7.5.

DEP 11 **The [MEPA Greenhouse Gas Emissions Policy and Protocol] allows the Proponent to select a model; however, MassDEP and DOER recommend using EQUEST for stationary source modeling.**

Building energy modeling is described in Section 7.3.

DEP 12 The DEIR should include the modeling printout for at least three scenarios: base case, preferred alternative case, and preferred alternative with greater GHG mitigation case. In addition the DEIR should include emission tables that compare base case emissions in tons with the mitigation alternatives showing the reduction in tons and percentage by emissions source, direct, indirect and transportation.

MassDEP is referring to an older version of the MEPA GHG Emissions Policy; the current (May 2010) version requires only two cases. Nevertheless, various individual mitigation measures are addressed in Section 7.0. Building energy model results and GHG emissions are presented in Section 7.3.

DEP 13 The DEIR should explain, in reasonable detail, any measure not selected that has the potential to significantly reduce GHG emissions... MassDEP encourages the Proponent to adopt cutting-edge energy efficient designs and equipment wherever feasible, taking into consideration that energy efficient designs yield cost-savings over time.

Mitigation measures that have not been adopted into the current Project design are nonetheless discussed in Section 7.4.

DEP 14 The DEIR should lay out information and plans to understand the feasibility of incorporating renewable energy into the Project design. Should a renewable energy option be infeasible, it is requested that the DEIR provide an explanation and a thoughtful discussion of the changes that would be needed for reconsideration of that alternative.

Section 7.2 includes a discussion of renewable energy technology included in the design. Section 7.4 presents the rationale for not using other renewable technologies.

DEP 15 MassDEP is very supportive of CHP for this Project... As the Proponent proceeds with the technical and economic feasibility evaluation, it may be helpful to consult the CHP Partnership, an organization that assists with the design process and to identify financing options and other services that can be accessed through the USEPA website: http://www.epa.gov/chp.

CHP is discussed in the context of the GHG analysis in Sections 7.2 and 7.4.

DEP 16 MassDEP supports the Proponent's efforts to evaluate anaerobic digestion as an energy source for this Project and requests that the DEIR describe and provide plans for an anaerobic digestion system, or alternative anaerobic digestion systems that would utilize available resources to meet the Project's energy needs. The potential for GHG emissions reductions from an alternative fuel should be considered in the DEIR... In addition, with respect to any proposed anaerobic digestion component of

the Project, the DEIR should discuss the applicability of MassDEP's regulations promulgated in November 2012 for the purpose of building capacity for managing organic materials (310 CMR 16.00, 310 CMR 19.00 & 314 CMR 12.00).

Anaerobic digestion is discussed in the context of the GHG analysis in Section 7.2.8.3.

DEP 17 In the event that an anaerobic digestion system is found to be infeasible for the Project, MassDEP requests that the DEIR provide an organics management plan for the Project.

Organics management is discussed in Section 2.2.4 and, in the context of the feasibility of composting or of an anaerobic digestion system, in the GHG analysis in Section 7.2.8.3 and 7.4.3.8.

DEP 18 It is anticipated that the final, new vehicle trip project will exceed MassDEP's review threshold of 3,000 daily trips for mixed use development, requiring an air quality mesoscale analysis of Project-related emissions... The analysis must compare the indirect emissions from transportation sources under future No Build, Build, and Build with Mitigation conditions. Subsequent environmental filings should include the results of the mesoscale analysis for VOC, NOx, and CO2 emissions under these conditions.

The methodology and results of the mesoscale analysis are presented in Sections 6.5.4.1 and 6.5.5.1, respectively.

DEP 19 MassDEP recommends that the Proponent exploit the potential of this transit-rich location by promoting transit service to the Project site from neighboring communities, Logan Airport, Downtown, and the Seaport District. Accordingly, the DEIR should explore all reasonable opportunities for trip reduction and management tailored to the specific needs of employees and patrons with particular emphasis on transit connections as well as bicycle and pedestrian infrastructure and amenities.

Section 5.8 presents an analysis and discussion of alternate modes to vehicle travel for patrons and employees, including an HOV Shuttle plan. The TDM program presented in Section 5.9 presents a comprehensive package of trip reduction strategies and incentives to promote alternative transportation modes.

DEP 20 MassDEP recommends that the Proponent consider the following three actions:

- Work closely with the MBTA to consider adding an on-site bus stop for the Express Bus Routes 424, 434, 448, and 449 for increased transit service to the site.

- Maintain the existing Suffolk Downs shuttle service to adjacent Blue Line stations and expand the shuttle service as necessary to accommodate additional Blue Line ridership to the Project site.
- Offer active support for any future consideration to expand the Silver Line into East Boston and Chelsea. Should the Hubway bike share program expand into East Boston, MassDEP recommends the Proponent support an on-site docking station.

The Proponent has committed to providing an MBTA bus stop on-site should the MBTA wish to route bus service through the Project site. The Proponent has also committed to enhancing the existing shuttle service between Suffolk Downs Station and Resort lobbies. The Proponent will continue to develop and refine transit options in coordination with the MBTA. The Proponent has committed to providing two Hubway stations when the City of Boston expands the Hubway program to include East Boston.

DEP 21 MassDEP recommends that the DEIR contain a greater emphasis on TDM and mitigation measures to reduce Project-related emissions, such as:

- Provide market incentives that encourage patrons to seek travel by charter bus service rather than private automobile.
- Charge market price for parking spaces used by SOV drivers. Proponents can charge a fee to those who drive alone, while keeping parking free for bus, transit, carpool or vanpool.
- Offer parking cash-out incentives to employees whose parking is provided. This strategy encourages employers/tenants to provide employees with an option for compensation for not utilizing dedicated parking spaces, thus encouraging employees to seek alternative modes of transportation such as walking, biking, carpooling, or taking public transit to work.
- Provide expanded private shuttle service to transit connections for both employees and patrons.
- Improve expanded private shuttle service to transit connections for both employees and patrons.
- Improve proposed bicycle parking by providing short and long-term accommodations, as appropriate, for Project employees and patrons. Bicycle parking should be secure, convenient, weather-protected, and sufficient to meet demand.
- Work with Boston officials to support and fund, as necessary, off-site improved bicycle access to the Project site, including the use of the most recent MassDOT Design Guidelines or engineering judgment, as appropriate.

- Offer Alternative Work Schedules to all employees as well as staggered work shifts, where appropriate, to reduce peak period traffic volumes.
- Provide Direct Deposit for employees.
- Participate in the USEPA SmartWay Transport Program. SmartWay is a voluntary program that increases energy efficiency and reduces GHG emissions.
- Provide Guaranteed Ride Home to those employees who regularly commute by transit, bicycle, or vanpool to the site and who have to leave work in the event of a family emergency or leave work late due to unscheduled overtime.
- Establish infrastructure that provides publicly available electric vehicle charging facilities.
- Provide electronic signage displaying shuttle and transit schedule information.
- Dedicate space for Car Sharing/Bike Sharing. The Proponent should dedicate a minimum of two car sharing spaces in the proposed garage. MassDEP recommends the Proponent provide support and dedicated space for bike sharing on site as this concept expands into the area.
- Hire an Employee Transportation Coordinator to administer the parking management program. A coordinator can act as a point of contact for the various tenants within a given development, help enforce the parking requirements, and carry out any other day-to-day tasks and strategies from the rest of the list above.
- Unbundle hotel guest parking fees from accommodation rates, thus encouraging alternative travel mode choice.
- Provide preferential and free parking for guests using carpools.
- Explore shared parking opportunities to take advantage of the varying parking demand periods of nearby facilities.

A comprehensive TDM plan is presented in Section 5.9.

DEP 22 MassDEP recommends that the Proponent work with its staff to implement construction-period diesel emission mitigation, which could include the installation of after-engine emission controls such as oxidation catalysts or diesel particulate filters, or the use of construction equipment that meet Tier 3 or Tier 4 emission standards for non-road construction equipment... In addition, Project contractor(s) are required to use ultra low sulfur diesel (ULSD) fuel in their off-road construction equipment in conjunction with after-engine emission controls.

Construction air quality, including the mitigation of diesel emissions, is discussed in the Draft CMP in Attachment L.

DEP 23 **The DEIR should address how the Project will ensure compliance with the [Massachusetts Idling] regulation (310 CMR 7.11), [which prohibits motor vehicles from idling their engines more than five minutes unless the idling is necessary to service the vehicle or to operate engine-assisted power equipment (such as refrigeration units) or other associated power].**

Idling during construction is discussed in the Draft CMP in Attachment L.

DEP 24 **The demolition activity must also conform to current Massachusetts Air Pollution Control regulations governing nuisance conditions at 310 CMR 7.01, 7.09 and 7.10. As such, the Proponent should proposed measures to alleviate dust, noise, and odor nuisance conditions.**

Mitigation measures proposed to alleviate dust, noise, and odor during construction are described in the Draft CMP in Attachment L.

DEP 25 **In addition to paper, glass, plastics, waste oil, and cardboard, MassDEP would appreciate and encourage a commitment to innovative recycling of the waste stream, characteristic of a resort casino, such as is being done with gently-used soap and personal care products.**

Solid waste and recycling are discussed in Section 2.2.4.

DEP 26 **In revising the Solid Waste Master Plan, MassDEP is advancing a goal to divert 450,000 tons of food waste from landfills and incinerators by 2020. In the future, large-scale food waste generators, which may include Caesars Resort, will be banned from landfilling or incinerating food waste. Therefore, MassDEP strongly encourages the Proponent to move forward with plans for anaerobic digestion on-site. If this is infeasible, an alternative anaerobic digestion facility and/or composting facility should be considered for the Project's organic waste.**

Use of off-site anaerobic digestion and composting facilities is described in Section 7.2.8.3.

DEP 27 **The ENF has identified 1 contamination site assigned to a release tracking number: RTN 3-14857 (RAO B-1)… Because contamination at the site is known or suspected, the appropriate tests should be conducted well in advance of the start of construction and professional environmental consulting services should be readily available to provide technical guidance to facilitate any necessary permits.**

The regulatory status of the site and the status of reportable conditions associated with this RTN are discussed in Section 6.11.1.

DEP 28 If dewatering activities are to occur at a site with contaminated groundwater, or in proximity to contaminated groundwater where dewatering can draw in the contamination, a plan must be in place to properly manage the groundwater and ensure site conditions are not exacerbated by these activities.

Construction-period dewatering is discussed in the Draft CMP in Attachment L.

DEP 29 The need to conduct real-time air monitoring for contaminated dust and to implement dust suppression must be determined prior to excavation of soils, especially those contaminated with compounds such as metals and PCBs. An evaluation of contamination concentrations in soil should be completed to determine the concentration of contaminated dust that could pose a risk to health of on-site workers and nearby human receptors. If this dust concentration, or action level, is reached during excavation, dust suppression should be implemented as needed, or earthwork should be halted.

Construction-period air quality, including potential dust impacts and measures proposed to mitigate those impacts, is addressed in the Draft CMP in Attachment L.

DEP 30 Parties constructing and/or renovating buildings in contaminated areas should consider whether chemical or petroleum vapors in subsurface soils and/or groundwater could impact the indoor air quality of the buildings.

Potential vapor intrusion is discussed in Section 6.11.4.

FROM: J. Lionel Lucien, P.E., Manager
Public/Private Development Unit

DATE: March 26, 2013

RE: Boston/Revere – Caesars Resort at Suffolk Downs – ENF
(EEA #15006)

The Office of Transportation Planning has reviewed the Environmental Notification Form (ENF) for the Caesars Resort at Suffolk Downs project in East Boston and Revere. The proposed project entails the redevelopment of the existing Suffolk Downs thoroughbred racetrack facility located along Route 1A on approximately 161 acres currently zoned as Economic Development Area (EDA). Upon completion, the project is proposed to include:

- An approximately 300-room hotel and an approximately 150-room hotel;
- Multipurpose meeting/entertainment space;
- Approximately 16 restaurants including fine dining, casual restaurants, and a marketplace/food court;
- Approximately 200,000 square feet of gaming space containing 4,000-5,000 slot machines, 200 table games, and a World Series of Poker room;
- Approximately 30,000 square feet of retail;
- A Central Utility Plant; and
- Approximately 2,600-space, seven-story parking garage; one level of underground valet parking for approximately 450 cars; and approximately 2,100 surface parking spaces (total of 5,150 spaces).

The project also involves continuing operations at the racetrack, as well as ongoing maintenance in the existing horse barn area, which will include replacing or improving horse barns as necessary. The project site comprises approximately 116 acres of land located within the City of Boston and 45 acres located in the City of Revere. The project is bounded to the west by a retail shopping plaza, properties containing fuel storage tanks owned by Irving Oil Terminals Inc. and by Global Petroleum, and Route 1A; to the north by Winthrop Avenue; to the east by the Massachusetts Bay Transportation Authority (MBTA) Blue Line and Bennington Street; and to the south by Waldemar Avenue. Based on information included in the ENF, the project at full build is expected

to generate approximately 24,600 new vehicle trips, for a total of 40,500 vehicle trips on an average weekday. The project is categorically included for the preparation of an Environmental Impact Report (EIR). The project requires a Vehicular Access Permit because of revised site access and roadway improvements proposed along Route 1A to mitigate the project's traffic impacts.

The ENF includes a general description of the existing Suffolk Downs Racetrack as well as the proposed redevelopment of the site into a destination resort casino. It also discusses the existing conditions and potential future conditions with and without the proposed project. Based on the expected trip generation for the project, the development plan for the project at full build would have significant impacts on the nearby transportation system. The ENF has identified a range of potential transportation improvements that, according to the proponent, would address existing local and regional transportation problems in the area, and would minimize the potential negative impacts of the project. These include both multimodal physical infrastructure improvements and non-physical improvements, such as a proposed TDM program designed to reduce single-occupant vehicle (SOV) travel and encourage the use of non-SOV travel modes.

The information presented in the ENF is generally limited to the description of the project, the existing and future conditions, and the potential mitigation. The information is adequate to enable the preparation of a scope for a transportation study for the project. Therefore, the DEIR should include a transportation study prepared in conformance with EOEEA/MassDOT Guidelines for Transportation Impact Assessments. The study should include a comprehensive assessment of the transportation impacts of the project based on a thorough analysis of existing conditions, future No-Build conditions, and future Build conditions. The study should take into account the regional context of the project and provide a comprehensive, integrated multimodal mitigation package that would allow the maximum possible use of non-SOV travel modes by both employees and customers. **DOT 01**

MassDOT strongly encourages the proponent to provide similar focus to both physical- and non-physical improvements and to seek creative solutions that would encourage both patrons and employees to reduce SOV traffic. **DOT 02**

Regional Context

Based on the nature of the land use, the trip generation for the project is expected to be drawn from a wide area of eastern Massachusetts and beyond into neighboring states. A preliminary analysis of casino demand presented by the proponent, which is based on Caesar Entertainment's model for potential casino patrons, seems to support that assumption. In keeping with this analysis, the project should be evaluated based on its regional nature and the key elements of the transportation system that casino patrons are expected use.

The DEIR should also provide a comprehensive evaluation of the travel characteristics of the casino patrons. **DOT 03** The proposed site is located within an urban setting, which provides many access options. The project abuts Route 1A, which is a major commuter route and provides connections to downtown Boston, the regional highway network, and to points north of the Boston core. The project site is also located along the MBTA Blue Line and in close proximity to several MBTA bus routes. Several designated bicycle routes are also close to the site and connect to adjacent neighborhoods. The site also connects to the urban fabric of the East Boston neighborhood, and provides the opportunity for direct pedestrian connections.

Generally, the availability and costs of different modes of transportation are two important factors that influence urban travel and trip patterns. The location of the site provides the opportunity to develop a comprehensive multimodal access and mitigation plan based on a thorough analysis of existing and future conditions. Through the mitigation program, the proponent should seek every opportunity to influence the mode choice of both casino patrons and employees in order to improve overall mobility in the vicinity of the site. **DOT 04**

Trip Generation

According to the ENF, the trip generation estimates for the project will be based on research data for other comparable projects, and on information from proprietary data for existing gaming venues and projected data for its proposed operations at Suffolk Downs. As indicated in the ENF, the Institute of Transportation Engineers (ITE) Trip Generation Manual does not contain trip generation factors for this type of facility. The DEIR should present a comprehensive analysis of the research and proprietary data cited above, and should provide the background documentation justifying the selection of the variable(s) used to estimate project trip generation. **DOT 05**

Consistent with MassDOT's analysis of other casino projects currently under review, the number of gaming positions seems to be the most appropriate variable in estimating the trip generation for casino facilities. The DEIR should provide information on the size, geographic location, and traffic volumes of the comparable sites that is sufficient to establish a correlation between the number of gaming positions and trip generation. Based on this information, the DEIR should provide a temporal distribution of traffic over a full one-week period, which would help determine the peak hours of casino traffic. This information would help identify the most critical peak analysis periods, which should consist of the highest combination of existing roadway volumes and project site trips. The DEIR traffic analysis should be based on these critical peak hour periods.

The DEIR should include all back-up data used to arrive at any trip generation in order to corroborate any assumptions included in the DEIR. The project proponent should present a trip generation discussion with an employee demand distribution based on the nature of work shifts. The proponent should evaluate the impacts of instituting different shift schedules around the availability of transit services in order to maximize transit usage by employees. **DOT 06**

Transit Demand and Mode Split

As described above, the MBTA currently operates extensive rapid transit and bus service to the site, as well as other services in the general vicinity of the project site. The DEIR should include an analysis of what additional transit demand would be generated by the project. As noted above and in the ENF, the Institute of Transportation Engineers (ITE) Trip Generation Manual does not contain trip generation factors for a facility of this type and size located in an urban setting. Moreover, similar resort and gaming facilities around the country may be of limited comparison since there are few, if any, similar facilities in the country that are as close to a rapid transit network as this location. While the proximity of transit provides an excellent opportunity for a high level of transit usage, MassDOT anticipates that it will be a challenge to adequately model the transit trip generation and trip assignments for the project. As a result, the proponent should work closely with the MassDOT Office of Transportation Planning and the MBTA Service Planning Department to develop appropriate and reasonable travel demand and trip generation characteristics. The DEIR should then present not just the **DOT 07**

results of that analysis, but a full and complete presentation on how those trip generation estimates and trip assignment rates were developed, and what research was done to support these rates.

Trip Distribution

The trip distribution for the project should be based on a gravity model or similar model to apply a spatial distribution onto the trip generation estimates in order to determine the origin-destination patterns of the casino trips in the study area. Additional factors such as population, travel time, and distance should be considered in the model to determine trip characteristics for casino patrons and employees. The DEIR should provide all appropriate documentation to verify how the different percentages are calculated and assigned to the roadway network and the transit system. In addition, the model should be able to consider other casino proposals in Massachusetts that could impact the trip distribution for this project. **DOT 08**

Once the trip generation estimates, the modal split assumptions, the trip distribution, and the trip assignment are developed, network maps of the study area should be created for the different peak-hour analyses and the different modes. **DOT 09**

Study Area

The proposed casino development is expected to add significant traffic in the surrounding communities of Chelsea, Revere, and within the City of Boston. As indicated in the ENF, the project is surrounded by a regional roadway network that includes Route 1A to the west, Route 145 (Revere Beach Parkway/Winthrop Avenue) to the north, Bennington Street to the east, and Waldemar Avenue to the south. In addition, the study area roadway network (in particular Route 1A) provides connections to the nearby interstate highway system and metropolitan highway system, which include the eastern terminus of I-90 (Massachusetts Turnpike), the Ted Williams Tunnel (TWT), the Sumner Tunnel, the Callahan Tunnel, and I-93.

The ENF has proposed a study area that includes locations within the Cities of Revere, Chelsea, and Boston. The study area includes a number of signalized and unsignalized intersections, three roundabouts/rotaries (Elliot, Butler, and Brown Circles), and the Route 1/Route 16 interchange that includes ramps and highway merges/diverges.

In addition to the locations proposed in the ENF, MassDOT recommends that the following locations and roadway segments be included in the study area: **DOT 10**

- The Route 60/Charger Street intersection;
- The Route 60/Sigourney Street intersection;
- The Route 1/Copeland Circle interchange (including the rotary and adjacent segments, as well as their associated impacts to the through-traffic on Route 1 between Route 60 and Route 99);
- The Ted Williams Tunnel;
- The Callahan Tunnel; and
- The Sumner Tunnel.

Horizon Year

Generally, MassDOT requires that a 7-year horizon be used to evaluate traffic impacts for most private development projects. Given the nature of the proposed land use, the location of the project, and the transportation infrastructure that may be impacted, MassDOT requires that a 10-year horizon (2022) be used for the traffic study, and that a 20-year design horizon be used for the proposed infrastructure improvements. This would allow for all the phases of the project to be completed and reach full occupancy; it would also enable MassDOT to adequately evaluate the effectiveness of the transportation system improvements and the TDM program. **DOT 11**

Traffic Volumes

The ENF has identified a comprehensive data collection program to evaluate existing and future traffic conditions. The data collection program consists of Automatic Traffic Recorder (ATR) counts and Turning Movement Counts (TMC) to measure the existing volumes on the roadway network at a number of locations in the study area. The ENF indicates that some of these counts were performed in 2010 and repeated in 2012. It is not clear whether the repeated counts were done for all of the locations within the study area. The proponent should be aware that 2010 counts will not be acceptable for use in the DEIR traffic analysis unless reviewed and approved by MassDOT. No counts taken prior to 2010 will be acceptable. **DOT 12**

The ENF includes a traffic volume summary table that indicates daily, evening peak hour, and afternoon peak hour traffic volumes for a typical weekday (Monday – Thursday), Friday, and Saturday for a number of roadway segments within the study area. The DEIR should provide a similar table that shows the increase in traffic volume on these roadway segments for the future No-Build and future Build conditions once the trip generation and distribution have been validated and approved by MassDOT. **DOT 13**

This table should include the Ted Williams Tunnel, Sumner Tunnel, and Callahan Tunnel in order to demonstrate existing daily volumes and peak characteristics. These facilities currently provide access to Logan International Airport, and it is critical that they continue to operate at acceptable levels of service. There may be three different traffic demand peak hours within the study area: the peak hour of the general traffic/tunnel facilities; the peak hour of Logan International Airport; and the peak hour of the resort casino. These three peak hours are likely to fall close together on Friday night, and the project-related traffic could result in an extended peak (Friday 5-8 PM) period of very high congestion levels in the tunnels. Thus, it is essential that the DEIR provide the necessary information and analysis for these tunnels in order to evaluate appropriate mitigation measures, if any, to minimize traffic impacts on these facilities. The proponent should work closely with the MassDOT Highway Division and Massport to obtain the latest ATR volumes for these facilities, in addition to other traffic counts that may be required to conduct the necessary analysis. **DOT 14**

Traffic Operations

The DEIR should present capacity analyses and a summary of average and 95th percentile vehicle queues for each intersection within the study area. The DEIR should also present a merge and diverge for each ramp junction, and weaving analysis for all the interchanges located in the study area. Any proposed traffic signal along Route 1A or at other locations must include a traffic signal warrant analysis conducted according to the Manual of Uniform Traffic Control Devices **DOT 15** **DOT 16**

(MUTCD). The DEIR should ensure that any proposed mitigation is compatible with future long-term transportation improvements under consideration by MassDOT for this area.

In addition, the proponent should provide a roadway segment analysis for the three harbor tunnel locations based on the latest methodology of the Highway Capacity Manual or appropriate traffic software analysis approved by MassDOT. This information is critical for MassDOT to evaluate the impacts of the project on these facilities and to help identify physical and/or non-physical mitigation measures to lessen the impacts associated with the project. **DOT 17**

The DEIR should present the performance measures of these analyses in a summary format that would allow comparisons of Existing, Future No-Build, and Future Build conditions with mitigation for all peak-hour conditions. Where appropriate, the DEIR should discuss how the proposed system improvements and impacts to one mode can be measured relative to the improvements and impacts of the other modes. **DOT 18**

Pedestrian Access

The ENF indicates that the project would provide pedestrian accommodations on site with appropriate connectivity to the off-site pedestrian network in the area. The DEIR should provide a thorough inventory of all existing, planned, and proposed services, facilities, and routes for accessing the site. It should also provide an evaluation of the network to include pavement conditions, sidewalk widths, crosswalks, compliance with current accessibility standards, and existing pedestrian volumes and movements. The proponent should develop the site plan to ensure that the project is as open to pedestrians, and to the neighborhood, and as permeable along all edges, as possible. **DOT 19**

Bike Access

The ENF also proposes improvements to the existing bicycle network within the vicinity of the project. The DEIR should include a detailed inventory of the bicycle network, to include types of bicycle facilities, widths of bicycle facilities, and bicycle volumes. The proponent should identify suitable bicycle routes within the study area, as well as any other existing bicycle facilities (e.g. bicycle lanes, cycle tracks, shared-use paths). The DEIR should reevaluate these routes based on the origin-destination patterns of potential casino employees and patrons. Based on this analysis, the proponent should consider the feasibility of expanding some of these existing routes or consider new routes to encourage bicycle travel in and around the site. **DOT 20**

Alternatives Analysis

The ENF has presented a conceptual plan for improvements that consists of a Route 1A northbound flyover at Boardman Street, an additional Route 1A southbound lane, the signalization of the Route 1A/Waldemar Avenue intersection, and the signalization of the Route 1A/Tomasello Drive intersection. It should be noted that MassDOT has not endorsed any access alternative for the site at this time. The proponent should continue discussions with MassDOT to evaluate alternatives that address long term regional goals for the corridor while providing access to the site. As such, the DEIR should include a comprehensive alternatives evaluation along this segment of the Route 1A corridor, between the Boardman Street intersection and the Route 145 intersection. **DOT 21**

The access alternatives should be consistent with MassDOT standards and provide for multimodal travel along the corridor. MassDOT recommends that this evaluation focus not only on physical improvement strategies, but also on creative and innovative strategies that would encourage non-SOV travel modes and reduce congestion within the study area. It should consider all previous studies conducted by MassDOT within this corridor and should ensure that any proposed mitigation is compatible with future long-term alternatives previously identified by MassDOT. The DEIR should also identify access management techniques to improve overall corridor traffic along the Route 1A corridor, the Route 145 corridor, and local streets in the vicinity of the project. For any locations where the proponent proposes a new traffic signal, the DEIR should include a traffic signal warrant analysis conducted according to the Highway Capacity Manual methodology. **DOT 22** **DOT 23**

The DEIR should include sufficiently detailed conceptual plans (preferably 80-scale) for any proposed roadway improvements in order to verify the feasibility of constructing such improvements. The conceptual plans should clearly show proposed lane widths and offsets, layout lines and jurisdictions, and the land uses (including access drives) adjacent to areas where improvements are proposed. Any proposed mitigation within the state highway layout must be consistent with a Complete Streets design approach that provides adequate and safe accommodation for all roadway users, including pedestrians, bicyclists, and public transit riders. Guidance on Complete Streets design guidelines is included in the MassDOT *Project Development and Design Guide*. Where these criteria cannot be met, the proponent should provide the justification as to the reason why, and should work with the MassDOT Highway Division to obtain a design waiver. **DOT 24** **DOT 25**

Public Transportation (MBTA)

Given the scale of the proposed project and its potential traffic impacts, the major congestion of the regional highway network in the area, and the proximity of excellent public transit services to the project, the proponent should make public transportation a core component of its mitigation program. Therefore, the DEIR should include a comprehensive analysis of existing and future conditions of transit services within the study area. The DEIR should identify existing frequency and capacity; provide a realistic projection of future demand; propose a comprehensive transit mitigation plan to reduce site vehicular traffic; and commit to key investments that will attract both employees and patrons to public transportation. The proponent should ensure that public transit serving the site has robust connections to the casino and all on-site facilities, and that transit access is visible, fully integrated with the casino facility and other elements of the project, and outfitted with ample accommodation for transit vehicles and with attractive amenities for passengers. The DEIR site plan should show, and the DEIR narrative should describe, how customers and employees arriving by buses, the Blue Line, and other transit modes will have accommodations at least equivalent to those for customers and employees arriving by private automobile. **DOT 26**

MassDOT and the MBTA are interested in working with the proponent to develop transportation plans for the project that allow for the project to take advantage of its close proximity to an extensive transit network, while at the same time realizing and responding to the inherent limitations of the transit system and the MBTA's capacity constraints. High-level MBTA-related issues that should be addressed in the DEIR include the following:

- What will the ridership impacts be on the MBTA Blue Line and bus network, and what changes to the current operational system, if any, will be required to accommodate this additional demand? **DOT 27**
- How will this additional demand affect Suffolk Downs Station given its size and existing condition? **DOT 28**
- What will the traffic impacts on the local and regional roadways be and how will MBTA buses currently operating in the area be affected by this additional traffic and/or proposed roadway changes? **DOT 29**
- What measures and steps will the proponent take to encourage, to the greatest degree possible facility employees and customers to arrive by transit? **DOT 30**
- How will the day to day operations of the resort facility impact MBTA stations and operations other than Suffolk Downs Station? **DOT 31**

Impacts to Blue Line Ridership

DOT 32

The DEIR should contain an assessment of how riders, particularly in the MBTA peak period, are expected to board and alight at Suffolk Downs Station. The MBTA understands from the proponent that it does not anticipate many casino patrons or employees to utilize Beachmont Station, given the pedestrian network that will exist from Beachmont. The DEIR should estimate what additional new ridership on the Blue Line can be anticipated and what time of day those impacts will occur. The proponent should work with the MBTA Service Planning Department to ensure that it has access to the most recent and most relevant ridership and operational statistics for the Blue Line.

Impacts to Suffolk Downs Station

The Blue Line Station at Suffolk Downs was designed and fully rebuilt in the mid-1990's as part of the major Blue Line Upgrade project designed to modernize all stations, make them accessible to people with disabilities, and accommodate longer, six-car Blue Line trains. The Suffolk Downs Station was designed, however, as a small neighborhood station and was not designed to accommodate the potentially large number of employees and customers that would access the Caesars Resort at Suffolk Downs by transit. In fact, the Suffolk Downs Station currently has the lowest number of daily boardings of any of the MBTA's heavy rail rapid transit stations (that is, Red, Orange, and Blue Lines).

In addition, in the nearly two decades since design plans for Suffolk Downs Station were conceived, there have been a number of advancements and new approaches to planning and design of transit facilities so as to reduce or eliminate the barriers that people with disabilities experience when trying to access transit. Many of these types of improvements and design elements are not implemented at stations like Suffolk Downs. Given what could be a substantial change in the usage and volumes of the station, many of these types of improvements will become all the more important for people accessing the station.

DOT 33

The DEIR should address what the additional ridership demand is on Suffolk Downs Station (or any other related Blue Line station such as Beachmont Station) and how that ridership compares not only to current usage but also to station capacity and station functionality. The DEIR should determine which current building and safety codes could be affected by adding potentially large numbers of riders to the station. A code analysis that compares existing station conditions to current codes (i.e. those relating to life safety, emergency egress, accessibility or other critical functions) should be performed

to determine what, if any, upgrades need to be made to the station. The proponent should work with the MBTA's Design Department, Engineering and Maintenance, and System-Wide Accessibility to identify key building and safety codes which are most applicable to this station. Of particular importance to the MBTA are all building codes and standards related to the Americans with Disabilities Act (ADA), the Massachusetts Architectural Access Board (MAAB), and Federal Transit Authority (FTA) regulations and guidance. The proponent should present in the DEIR what the current accessibility conditions of the station are and how those conditions should be upgraded given the potentially large number of additional riders being added to this small station.

Impacts to MBTA Bus Service

In addition to Blue Line service, the area is also served by a series of MBTA bus routes, predominantly the Route 119 (Northgate to Beachmont Station), as well as Route #120 (Orient Heights to Maverick Station). The Route #450 and Route #459 (running from Boston to Salem) currently make stops in the vicinity. A third series of Routes (#424, #434, #448 and #449) run through the travel area but do not currently stop in the vicinity of the proposed resort.

As part of the DEIR, the MBTA would like to see a detailed presentation of the impact to the MBTA bus network. Specifically, the MBTA asks that the DEIR be prepared so that the document can identify the future build demand for the #119 and #120 buses and how it compares to the future No-Build demand for local bus services. Based on this assessment, the DEIR should present the anticipated demand in terms of MBTA service standards for bus volumes and capacity in order to determine what the impacts to the MBTA bus network will be. The DEIR should determine what if any additional service would need to be added to the bus network in order to ensure that the MBTA bus routes would meet existing MBTA service standards. Using current MBTA standards for labor, fuel, maintenance costs, etc., the proponent should calculate what the cost to the MBTA would be to accommodate all of the unmet transit demand and to do so in a way that meets MBTA service standards. **DOT 34**

In addition, the DEIR should specifically address what the operational impacts to MBTA bus service would be due to traffic generated by the project. The MBTA assumes that the DEIR will provide a level of service analysis for all affected intersections. The MBTA requests that the DEIR present, in a tabular format, an assessment of which of these intersections are utilized by MBTA buses and how their timing or turning movements may be affected by the increased traffic and/or proposed roadway changes generated by the project. **DOT 35**

New Transit Usage during Existing MBTA Peak Periods

For both rapid transit and bus service, the MBTA is currently constrained from offering more service during the AM and PM weekday rush hours (approximately 7:00-9:00 AM and 4:00-6:30 PM). This is due to the limitations of existing infrastructure – the number of rail and bus vehicles, the capacity of storage and maintenance facilities, the limitations of rail signaling systems, and so on. Existing ridership at these peak periods already results in overcrowded conditions throughout the MBTA network. Therefore, special note should be taken of any impacts to MBTA service from the proposed resort facility during weekday rush hours, and the DEIR should describe how any negative impacts could be mitigated. **DOT 36**

Access to and From Suffolk Downs Station

The DEIR should identify, preferably in graphic format, how the facility's shuttle buses will access the Blue Line Station at Suffolk Downs. The shuttle buses that currently serve Suffolk Downs racetrack pick up and drop off passengers approximately 100 feet from the entrance to the station. The DEIR should show how these new and additional shuttles will serve the station and how passengers will have a safe and accessible path of travel from the Blue Line Station to the Shuttle. The proponent should develop its site plan to ensure that the pickup and drop off of transit and shuttle bus passengers is seamless and easy for passengers, particularly those passengers with limited mobility. **DOT 37**

Additionally, the DEIR should identify, also preferably in graphic format, how pedestrians who choose to walk from the Blue Line Station or the local bus service will access the facility. The DEIR should demonstrate what the path of travel will be, and what steps will be taken to design and maintain a path of travel that is safe, accommodating, accessible and inviting. The MBTA feels that while immediate transit access to the facility should help to encourage transit ridership to the facility, a well-planned and well-maintained path between the Suffolk Downs station and the resort facility is critical to encouraging transit usage. **DOT 38**

The MBTA believes that the proposed Caesar's Resort at Suffolk Downs has a unique opportunity to be fully integrated with the existing transit network. The DEIR should identify the steps that will be taken to encourage transit usage and what the resulting effects will be on the existing transit network. The MBTA has extensive background and information on the service in the area.

Airspace Obstructions

The project site appears to be located within protected airport approach and/or transitional airspace areas as defined by state law (Massachusetts General Law, Chapter 90, Section 35B) and Federal regulations (Federal Aviation Regulation Part 77, Objects Affecting Navigable Airspace). Therefore, state and federal notice is required for the following: **DOT 39**

- Proposed buildings;
- Proposed parking lots/parking structures;
- Proposed parking lot lights;
- Proposed permanent street lights and/or traffic lights;
- Proposed temporary installation of cranes that may be used to construct the structure/structures; and
- Proposed temporary lights that may be used during nighttime construction.

Both state (MassDOT Aeronautics Division) and federal (Federal Aviation Administration) agencies can be notified of the proposed project by filing online as indicated below.

- **State notice** is required by filing a MAC Form E-10, *Aeronautics Commission Request for Airspace Review*, per 780 Code of Massachusetts Regulations (CMR) 111.7, *Hazards to Air Navigation*, to determine if any part of the project impacts the protected airport approach areas. Online filing is available via http://app1.massdot.state.ma.us/airspacereview/
- **Federal notice** is required by filing an FAA Form 7460-1, *Notice of Proposed Construction or Alteration*, per Code of Federal Regulations (CFR) Title 14 Part 77.13, *Construction or Alteration Requiring Notice*, to determine if any part of the project impacts the protected

airport approach areas. Online filing is available via https://oeaaa.faa.gov/oeaaa/external/portal.jsp

- Under provisions of 780 CMR 111.7, *Hazards to Air Navigation*, the proponent of the project is required to furnish a copy of the FAA Form 7460-1 to the MassDOT Aeronautics Division within three business days after submitting said form to the FAA.

Lighting/Glare Impacts to Aviation

The preservation of optimal night vision is important for pilots operating an aircraft at night. Exposure to bright light can result in temporary visual impairment due to glare. Therefore, any temporary lights that may be used during nighttime construction must be placed and aimed in such a way as to minimize glare to aircraft pilots. Light shielding must be incorporated into the design of all temporary lighting such as cranes and lighting used during nighttime construction and permanent lighting such as parking lot and traffic lights to reduce potential visual impacts. **DOT 40**

Additionally, lighting and glare could occur if the project employs reflective building materials or green technologies such as solar panels. Please ensure that any such materials are discussed with both Massport and the MassDOT Aeronautics Division. **DOT 41**

Construction Activities and Impacts to Aviation

Construction activities should also be closely coordinated with Massport and the MassDOT Aeronautics Division. If temporary cranes, construction lights, or other heavy equipment will be used, or if dust and/or smoke are generated, Massport and the MassDOT Aeronautics Division must be able to ensure that appropriate notices to airmen can be issued (NOTAMS). Additionally, if cranes are to be used for construction purposes, the cranes must be appropriately marked and lighted according to U.S. Department of Transportation/Federal Aviation Administration Advisory Circular (AC) 70/7460-1K, Obstruction Marking and Lighting. The temporary cranes shall also be lowered to the ground at night and/or when not in use. **DOT 42**

Parking

According to the ENF, a substantial portion of the current site comprises surface parking, with a total capacity of 5,830 spaces. The redevelopment of the site would include an approximately 2,600-space, seven-story parking garage; one level of underground valet parking for approximately 450 cars; and approximately 2,100 surface parking spaces, for a total of 5,150 spaces. Although the project is reducing the number of spaces compared to existing conditions, the DEIR should clarify how the parking needs of the project were determined and explain the methodology used to determine the total parking required. **DOT 43**

The Institute of Transportation Engineers' *Parking Generation* generally provides a reasonable basis for comparison to parking requirements under local zoning, but this reference does not present parking rates for this type of land use. In the absence of such a ready reference for parking supply, the DEIR should analyze the anticipated parking demand based upon parking needs and supplies for comparable facilities (based on multiple data sources, and discounted to allow for the urban location and available transit); the projected traffic demand at different times of day; the expected parking duration; and the different types of parking demand (e.g. casino patron, employee, **DOT 44**

hotel guest, etc.). The proponent should propose parking policies that are designed to minimize parking demand and automobile use, such as fees for parking, parking cash-out policies, and other demand-reduction measures for employees.

Transportation Demand Management

The DEIR must include a proposed Travel Demand Management (TDM) program based on the project proposal that would implement measures aimed at reducing site trip generation. The DEIR should further refine the Transportation Demand Management (TDM) program in light of the regional context of the project. The TDM plan should be based on the specific measures that have been successful in reducing trip generation for similar facilities, and should further investigate measures that would maximize usage of existing and new pedestrian, bicycle, and transit facilities. Such measures should include subsidizing transit passes for both employees and patrons/hotel guests, limiting the available parking supply, providing on-site amenities and conveniences that would reduce the need for automobile travel, and shuttle services that fill unmet gaps in transit access for the proposed project. The proponent should provide a central, climate-controlled transit hub that is integrated into the facility so that transit provides access that is equivalent to or better than that provided to patrons arriving by automobile. **DOT 45**

The proponent should also commit to hiring a full-time, dedicated Transportation Coordinator for the project; this Transportation Coordinator may also require support staff. The DEIR should also evaluate the feasibility of providing shuttle services that would run from remote parking locations within the casino market area, similar to the Logan Express Bus program that serves travelers and employees going to Logan Airport. MassDOT recommends that the proponent investigate opportunities for partnering or emulating the existing program at Braintree, Framingham, Peabody and Woburn or other MBTA parking locations as mentioned above. To that end, the proponent should develop a strong incentive program that would encourage both casino patrons and employees to use such services. **DOT 46** **DOT 47**

The proponent should also seek to address the gap in overnight transportation service by reaching out to other transportation service providers such as the Massport Logan Express, internal airport shuttles, the MBTA sunrise service, the large shuttle operations within the Boston area, and the private regional/intercity bus lines that already serve South Station and other downtown destinations. **DOT 48**

The DEIR should identify what type of TDM programs will be implemented to ensure that employees use transit to the greatest degree possible. Specifically, the DEIR should identify how shifts will be scheduled so that all three shifts can utilize transit. The MBTA has observed that most employees who work a second or a third shift can generally rely on the transit service if the second or third shifts begin/end between 6:00 AM and 12:00 midnight (except Sundays between 7:00 AM and 12:00 midnight). This type of scheduling allows employees coming off of a second shift or doing an overnight shift to generally be able to use transit, even though transit ceases to operate overnight. The DEIR should describe how shifts will be laid out, and how tenants and vendors at the facility will be encouraged to schedule shifts as well so as to promote transit usage as much as possible, while also being mindful of the weekday rush hour conditions noted above. **DOT 49**

DOT 50

Additionally, the DEIR should identify whether or not employee shuttles from remote locations will be used to allow employees to park and take shuttle buses to the facility. If so, the proponent should work with the MBTA to see if a joint usage of parking facilities can be arranged at the MBTA parking locations such as the Lynn parking garage, Wellington Station, Anderson Intermodal Facility in Woburn or other remote locations. The proponent should work with the MBTA Parking Department to identify appropriate remote locations where a shared usage agreement can be arranged.

DOT 51

The DEIR should also describe the full range of TDM proposals being considered by the proponent and how those TDM concepts will be incorporated into the operations of the facility. The DEIR should also propose how these TDM ideas can be tracked and evaluated during operations so that they can be regularly reviewed and updated as appropriate.

DOT 52

The TDM program should identify existing and proposed connections for pedestrians and bicyclists; analyze their existing and future conditions based on the project's impacts; and commit to making improvements that will increase usage of those modes. The site plan should also provide pedestrian and bicycle connections to existing land uses within close proximity to the project site, maximize the connectivity and permeability of the site edges, and provide excellent pedestrian and bicycle connections within the project site. The proponent should provide ample bicycle parking, including both secure, weather-protected bicycle parking for employees and highly-visible bicycle parking near the entrances for customers; on-site showers, lockers, and changing facilities; and financial incentives to encourage employees and customers to walk, bicycle, or ride public transit to the site.

DOT 53

The project proponent should also consult with MassRides, the Commonwealth's travel options service, as well as the Logan Transportation Management Association (Logan TMA). These travel options services can help the proponent identify potential trip reduction measures, especially

DOT 54

those targeting employees, and support the implementation of the TDM program. The proponent should provide charging stations for plug-in electric vehicles, and reserve these spaces for such

DOT 55

vehicles. The DEIR should also identify incentives for both patrons and employees to use high occupancy vehicles, either in the form of financial incentives or priority treatments such as preferred parking spaces. The proponent should also promote ridesharing through NuRide, the Commonwealth's web-based trip planning and ridematching service that enables participants to earn rewards for taking "green" trips. The proponent should provide information on the substance and outcomes of its consultations in the DEIR, along with a summary of the revised TDM program proposal.

Transportation Monitoring Program

DOT 56

As part of the project mitigation program, the project proponent should commit to implement a transportation monitoring program to be conducted upon the occupancy of the project. The goals of the transportation monitoring program will be to evaluate the assumptions made in the DEIR and the adequacy of the transportation mitigation measures, as well as to determine the effectiveness of the TDM program. The project proponent shall discuss with MassDOT an appropriate timeframe for the monitoring program, or commit to initiating the monitoring program upon MassDOT's request.

Due to the size of the project, MassDOT anticipates the need to monitor and update the TDM program as necessary before the project reaches full occupancy. If the traffic monitoring program indicates that the proposed mitigation is not effective in accommodating the future traffic volumes at

key area intersections impacting the state highway system, the project proponent will be responsible for identifying and implementing operational improvements at these constrained locations. These improvements could entail traffic signal timing and phasing modifications, optimization of the coordinated/interconnected signal system, and/or further refinement of the TDM program to reduce site trip generation. The ENF indicates that the proponent would provide a monitoring program based on the City of Boston Transportation Access Plan Agreement and/or the MassDEP Rideshare regulations. MassDOT will require its own transportation monitoring program to ensure that the TDM measures and the infrastructure improvements are successful in reducing traffic volumes and reducing congestion along a number of key corridors within the study area, although MassDOT is amenable to the proponent coordinating its response with the requirements of the City of Boston and MassDEP monitoring programs.

The Proponent should continue consultation with appropriate MassDOT Divisions, including the Office of Transportation Planning, the Highway Division, and the MBTA during the preparation of the DEIR for the project. If you have any questions regarding these comments, please contact me at (617) 368-8862 or Andrew Brennan of the MBTA at 617-222-3126 or by email at abrennan@mbta.com.

MASSACHUSETTS DEPARTMENT OF TRANSPORTATION

DOT 01 **The DEIR should include a transportation study prepared in conformance with EOEEA/MassDOT Guidelines for Transportation Impact Assessments. The study should include a comprehensive assessment of the transportation impacts of the Project based on a thorough analysis of existing conditions, future No-Build conditions, and future Build conditions. The study should take into account the regional context of the Project and provide a comprehensive, integrated multimodal mitigation package that would allow the maximum possible use of non-SOV travel modes by both employees and customers.**

A comprehensive transportation study has been prepared in conformance with EEA/MassDOT Guidelines for Transportation Impact Assessments. This study is presented in Section 5.0 along with a multimodal package of alternative modes supported by a comprehensive TDM plan.

DOT 02 **MassDOT strongly encourages the Proponent to provide similar focus to both physical and non-physical improvements and to seek creative solutions that would encourage both patrons and employees to reduce SOV traffic.**

The transportation plan for the Project presented in Section 5.0 includes a wide range of multimodal physical and non-physical improvements which strives to reduce SOV travel by patrons and employees while improving infrastructure for alternative modes as well as addressing existing traffic issues and potential Project impacts.

DOT 03 **The DEIR should also provide a comprehensive evaluation of the travel characteristics of the casino patrons.**

A comprehensive evaluation of the travel characteristics of patrons and employees is presented in Sections 5.4.1 through 5.4.7.

DOT 04 **The location of the site provides the opportunity to develop a comprehensive multimodal access and mitigation plan based on a thorough analysis of existing and future conditions. Through the mitigation program, the Proponent should seek every opportunity to influence the mode choice of both casino patrons and employees in order to improve overall mobility in the vicinity of the site.**

As described in Section 5.0, the site design and transportation plan for the Project seize the opportunity to take advantage of multimodal access supported by a comprehensive TDM plan to influence mode choice by patrons and employees.

DOT 05 As indicated in the ENF, the Institute of Transportation Engineers (ITE) Trip Generation Manual does not contain trip generation factors for this type of facility. The DEIR should present a comprehensive analysis of the research and proprietary data [for existing gaming venues], and should provide the background documentation justifying the selection of the variable(s) used to estimate Project trip generation. Consistent with MassDOT's analysis of other casino projects currently under review, the number of gaming positions seems to be the most appropriate variable in estimating the trip generation for casino facilities. The DEIR should provide information on the size, geographic location, and traffic volumes of the comparable sites that is sufficient to establish a correlation between the number of gaming positions and trip generation. Based on this information, the DEIR should provide a temporal distribution of traffic over a full one-week period, which would help determine the peak hours of casino traffic. This information would help identify the most critical peak analysis periods, which should consist of the highest combination of existing roadway volumes and Project site trips. The DEIR traffic analysis should be based on these critical peak hour periods.

A detailed description of travel demand and trip generation characteristics for the Project, based on evaluation of extensive research on other successful projects and experience of the Proponent and including data collection at comparable sites, is presented in Sections 5.4.1 through 5.4.5.

DOT 06 The Project Proponent should present a trip generation discussion with an employee demand distribution based on the nature of work shifts. The Proponent should evaluate the impacts of instituting different shift schedules around the availability of transit services in order to maximize transit usage by employees.

The employees' demand distribution, based on extensive proprietary data, is presented and discussed in Section 5.4.2. As explained, the multiple shift changes required to support the range of job types at the Project already result in a temporal distribution of employee trips throughout the day. In the TDM plan (see Section 5.9), the Proponent has committed to modifying work shifts to minimize commuting during the nighttime period when the MBTA is not in operation.

DOT 07 The DEIR should include an analysis of what additional transit demand would be generated by the Project... While the proximity of transit provides an excellent opportunity for a high level of transit usage, MassDOT anticipates that it will be a challenge to adequately model the transit trip generation and trip assignments for the Project. As a result, the Proponent should work closely with the MassDOT Office of Transportation Planning and the MBTA Service Planning Department to develop appropriate and reasonable travel demand and trip generation

characteristics. The DEIR should then present not just the results of that analysis, but a full and complete presentation on how those trip generation estimates and trip assignment rates were developed, and what research was done to support these rates.

An analysis of existing and Build transit operations, based on ridership information provided by the MBTA, is presented in Sections 5.2.1 and 5.8.1, respectively. The basis for Project demand projections is described in detail in Section 5.4.1.

DOT 08 The trip distribution for the Project should be based on a gravity model or similar model to apply a spatial distribution onto the trip generation estimates in order to determine the origin-destination patterns of the casino trips in the study area. Additional factors such as population, travel time, and distance should be considered in the model to determine trip characteristics for casino patrons and employees. The DEIR should provide all appropriate documentation to verify how the different percentages are calculated and assigned to the roadway network and the transit system. In addition, the model should be able to consider other casino proposals in Massachusetts that could impact the trip distribution for this Project.

The Project trip distribution and assignment analysis is presented in Section 5.4.7.

DOT 09 Once the trip generation estimates, the modal split assumptions, the trip distribution, and the trip assignment are developed, network maps of the study area should be created for the different peak-hour analyses and the different modes.

Study area network maps are presented for all analysis scenarios in the figures accompanying Section 5.0 (see Volume II, Project Figures).

DOT 10 In addition to the locations proposed in the ENF, MassDOT recommends that the following locations and roadway segments be included in the study area:

- The Route 60/Charger Street intersection;
- The Route 60/Sigourney Street intersection;
- The Route 1/Copeland Circle interchange (including the rotary and adjacent segments, as well as their associated impacts to the through-traffic on Route 1 between Route 60 and Route 99);
- The Ted Williams Tunnel;
- The Callahan Tunnel;
- The Sumner Tunnel; and

- [the following two included per April 3, 2013 email:] Route 1A and the Wonderland MBTA Station Driveway; and
- Route 1A/Revere Street (signalized intersection).

The additional locations requested by MassDOT have been incorporated in the study area for the transportation analysis presented in Section 5.0, and are noted specifically in Section 5.2.6.

DOT 11 Given the nature of the proposed land use, the location of the Project, and the transportation infrastructure that may be impacted, MassDOT requires that a 10-year horizon (2022) be used for the traffic study, and that a 20-year design horizon be used for the proposed infrastructure improvements. This would allow for all the phases of the Project to be completed and reach full occupancy; it would also enable MassDOT to adequately evaluate the effectiveness of the transportation system improvements and the TDM program.

The Build impact analysis presented in Section 5.4 is based on a 10-year horizon (2022), and the alternatives analysis for the Route 1A infrastructure improvements presented in Section 5.5 also includes a 20-year design horizon analysis.

DOT 12 The Proponent should be aware that 2012 [ATR counts and TMC] will not be acceptable for use in the DEIR traffic analysis unless reviewed and approved by MassDOT. No counts taken prior to 2010 will be acceptable.

The validation of 2010 and 2012 traffic counts is presented in Section 5.2.7, and MassDOT has approved the relevant traffic counts incorporated in the DEIR/EPNF analysis.

DOT 13 The ENF includes a traffic volume summary table that indicates daily, evening peak hour, and afternoon peak hour traffic volumes for a typical weekday (Monday-Thursday), Friday, and Saturday for a number of roadway segments within the study area. The DEIR should provide a similar table that shows the increase in traffic volume on these roadway segments for the future No-Build and future Build conditions once the trip generation and distribution have been validated and approved by MassDOT. This table should include the Ted Williams Tunnel, Sumner Tunnel, and Callahan Tunnel in order to demonstrate existing daily volumes and peak characteristics... it is critical that they continue to operate at acceptable LOS.

No-Build and Build traffic volumes are presented in Sections 5.4 and 5.5, respectively.

DOT 14 There may be three different traffic demand peak hours within the study area: the peak hour of the general traffic/tunnel facilities; the peak hour of Logan International Airport; and the peak hour of the resort casino. These three peak hours are likely to fall close together on Friday night, and the Project-related traffic could result in an extended peak (Friday 5-8PM) period of very high congestion levels in the tunnels. Thus, it is essential that the DEIR provide the necessary information and analysis for these tunnels to evaluate appropriate mitigation measures, if any, to minimize traffic impacts on these facilities. The Proponent should work closely with the MassDOT Highway Division and Massport to obtain the latest ATR volumes for these facilities, in addition to other traffic counts that may be required to conduct the necessary analysis.

Traffic data for the harbor tunnels are discussed in Section 5.2.7.

DOT 15 The DEIR should present capacity analyses and a summary of average and 95th percentile vehicle queues for each intersection within the study area. The DEIR should also present a merge and diverge for each ramp junction, and weaving analysis for all other intersections located in the study area.

The capacity analysis presented in Section 5.7 includes vehicle queues as requested, and also includes merge/diverge and weaving analysis where appropriate.

DOT 16 Any proposed traffic signal along Route 1A or at other locations must include a traffic signal warrant analysis conducted according to the MUTCD. The DEIR should ensure that any proposed mitigation is compatible with future long-term transportation improvements under consideration by MassDOT for this area.

Traffic signal warrant analysis will be performed for proposed signal locations on Route 1A and other locations as the concept alternatives are further developed in coordination with MassDOT, DCR, and/or the cities of Boston and Revere.

DOT 17 The Proponent should provide a roadway segment analysis for the three harbor tunnel locations based on the latest methodology of the Highway Capacity Manual or appropriate traffic software analysis approved by MassDOT.

As described in Sections 5.2.7 and 5.7, adequate data are not available for the three harbor tunnels to facilitate roadway segment analysis, but the Proponent will continue to work with MassDOT to collect appropriate data to facilitate such analysis.

DOT 18 The DEIR should present the performance measures of these [transportation] analyses in a summary format that would allow comparisons of Existing, Future No-Build, and Future Build conditions with mitigation for all peak-hour conditions.

Where appropriate, the DEIR should discuss how the proposed system improvements and impacts to one mode can be measured relative to the improvements and impacts of the other modes.

Section 5.0 presents Existing, No-Build, Build, and Build with HCA commitments analyses for both the critical Friday afternoon peak and Saturday afternoon peak hours. Although limited Project trip generation is projected for the weekday morning peak, the Route 1A infrastructure alternatives analysis presented in Section 5.5 also includes morning peak-hour analysis to support design considerations.

DOT 19 The DEIR should provide a thorough inventory of all existing, planned, and proposed services, facilities, and routes for accessing the site. It should also provide an evaluation of the network to include pavement conditions, sidewalk widths, crosswalks, compliance with current accessibility standards, and existing pedestrian volumes and movements. The Proponent should develop the site plan to ensure that the Project is as open to pedestrians, and to the environment, and as permeable along all edges, as possible.

Sections 1.4 and 4.4.7 describe pedestrian and bicycle connections on the Project site and in the surrounding vicinity.

DOT 20 The DEIR should include a detailed inventory of the bicycle network, to include types of bicycle facilities, widths of bicycle facilities, and bicycle volumes. The Proponent should identify suitable bicycle routes within the study area, as well as any other existing bicycle facilities (e.g. bicycle lanes, cycle tracks, shared-use paths). The DEIR should reevaluate these routes based on the origin-destination patterns of potential casino employees and patrons. Based on this analysis, the Proponent should consider the feasibility of expanding some of these existing routes or consider new routes to encourage bicycle travel in and around the site.

Section 5.3.2 describes and presents the existing and planned bicycle network. Proposed on- and off-site bicycle accommodations are described in Sections 5.6 and 5.8.3.

DOT 21 It should be noted that MassDOT has not endorsed any access alternative for the site at this time. The Proponent should continue discussions with MassDOT to evaluate alternatives that address long-term regional goals for the corridor while providing access to the site. As such, the DEIR should include a comprehensive alternatives evaluation along this segment of the Route 1A corridor, between the Boardman Street intersection and the Route 145 intersection. The access alternatives should be consistent with MassDOT standards and provide for multimodal travel along the corridor. MassDOT recommends that this evaluation

focus not only on physical improvement strategies, but also on creative and innovative strategies that would encourage non-SOV travel modes and reduce congestion within the study area.

An alternatives analysis of Route 1A infrastructure improvements is presented in Section 5.5. Strategies to encourage non-SOV travel and reduce congestion are described in Sections 5.8 and 5.9.

DOT 22 The DEIR should identify access management techniques to improve overall corridor traffic along the Route 1A corridor, the Route 145 corridor, and local streets in the vicinity of the Project.

A primary objective of the roadway improvements identified in Section 5.5 and 5.6 is the management of access in a way that addresses existing safety issues and provides safe access to the Resort.

DOT 23 For any locations where the Proponent proposes a new traffic signal, the DEIR should include a traffic signal warrant analysis conducted according to the Highway Capacity Manual methodology.

Traffic signal warrant analysis will be performed for proposed signal locations on Route 1A and other locations as the concept alternatives are further developed in coordination with MassDOT, DCR, and/or the cities of Boston and Revere.

DOT 24 The DEIR should include sufficiently detailed conceptual plans (preferably 80-scale) for any proposed roadway improvements in order to verify the feasibility of constructing such improvements. The conceptual plans should clearly show proposed lane widths and offsets, layout lines and jurisdictions, and the land uses (including access drives) adjacent to areas where improvements are proposed.

Concept plans for all proposed roadway improvements are included in Sections 5.5 and 5.6.

DOT 25 Any proposed mitigation within the state highway layout must be consistent with a Complete Streets design approach that provides adequate and safe accommodation for all roadway users, including pedestrians, bicyclists, and public transit riders.

The concept plans for roadway improvements presented in Sections 5.5 and 5.6 have been developed consistent with a Complete Streets approach, and the design development in coordination with MassDOT, DCR, and the cities of Revere and Boston will be consistent with a Complete Streets approach.

DOT 26 Given the scale of the proposed Project and its potential traffic impacts, the major congestion of the regional highway network in the area, and the proximity of excellent public transit services to the Project, the Proponent should make public

transportation a core component of its mitigation program. Therefore, the DEIR should include a comprehensive analysis of existing and future conditions of transit services within the study area. The DEIR should identify existing frequency and capacity, provide a realistic projection of future demand, propose a comprehensive transit mitigation plan to reduce site vehicular traffic, and commit to key investments that will attract both employees and patrons to public transportation. The Proponent should ensure that public transit serving the site has robust connections to the casino and all on-site facilities, and that transit access is visible, fully integrated with the casino facility and other elements of the Project, and outfitted with ample accommodation for transit vehicles and with attractive amenities for passengers. The DEIR site plan should show, and the DEIR narrative should describe, how customers and employees arriving by buses, the Blue Line, and other transit modes will have accommodations at least equivalent to those for customers and employees arriving by private automobile.

The Proponent recognizes the importance of transit access, and transit is incorporated as a key mode for the Project by enhancing the connection with Suffolk Downs Station in the site plan and robust TDM commitments to encourage transit use. A comprehensive transit analysis is presented in Sections 5.2.1 and 5.8.1 for existing and future Build conditions, respectively.

DOT 27 What will the ridership impacts be on the MBTA Blue Line and bus network, and what changes to the current operational system, if any, will be required to accommodate this additional demand?

Potential impacts to the MBTA network and operations are described in Section 5.8.1.

DOT 28 How will this additional demand affect Suffolk Downs Station given its size and existing condition?

An analysis of Project demand at Suffolk Downs Station is presented in Section 5.8.1.

DOT 29 What will the traffic impacts on the local and regional roadways be and how will MBTA buses currently operating in the area be affected by this additional traffic and/or proposed roadway changes?

An analysis of potential traffic impacts to MBTA buses is presented in Section 5.8.1.3.

DOT 30 What measures and steps will the Proponent take to encourage, to the greatest degree possible, facility employees and customers to arrive by transit?

In addition to enhancing the shuttle connection with Suffolk Downs Station, and including a potential MBTA bus stop at the Resort, should the MBTA wish to route buses through the site the Proponent offers a TDM plan in Section 5.9 that includes many actions and strategies to encourage transit use by patrons and employees.

DOT 31 **How will the day-to-day operations of the resort facility impact MBTA stations and operations other than Suffolk Downs Station?**

A comprehensive analysis of potential impacts to the MBTA stations and operations is presented in Section 5.8.1.

DOT 32 **The DEIR should contain an assessment of how riders, particularly in the MBTA peak period, are expected to board and alight at Suffolk Downs Station... The DEIR should estimate what additional new ridership on the Blue Line can be anticipated and what time of day those impacts will occur.**

An analysis of boardings and alightings at Suffolk Downs Station is included in the transit analysis in 5.8.1, which also identifies new ridership and potential impacts by time of day for a weekday and Saturday.

DOT 33 **The DEIR should address what the additional ridership demand is on Suffolk Downs Station (or other related Blue Line station such as Beachmont Station) and how that ridership compares not only to current usage but also to station capacity and station functionality. The DEIR should determine which current building and safety codes could be affected by adding potentially large numbers of riders to the station. A code analysis that compares existing station conditions to current codes (i.e., those relating to life safety, emergency egress, accessibility or other critical functions) should be performed to determine what, if any, upgrades need to be made to the station... The Proponent should present in the DEIR what the current accessibility conditions of the station are and how those conditions should be upgraded given the potentially large number of additional riders being added to this small station.**

Additional Project-related ridership demand is described in Section 5.4.6, and the use of MBTA stations is presented in Section 5.8.1.1. The Proponent has had preliminary discussions with MBTA staff, and will continue to explore station code and accessibility issues at Suffolk Downs Station in coordination with the MBTA to identify needed improvements.

DOT 34 **As part of the DEIR, the MBTA would like to see a detailed presentation of the impact to the MBTA bus network. Specifically, the MBTA asks that the DEIR be prepared so that the document can identify the future build demand for the #119 and #120 buses and how it compares to the future No-Build demand for local bus services. Based on this assessment, the DEIR should present the anticipated demand in terms of MBTA service standards for bus volumes and capacity to**

determine what the impacts to the MBTA bus network will be. The DEIR should determine what if any additional service would need to be added to the bus network to ensure that the MBTA bus routes would meet existing MBTA service standards. Using current MBTA standards for labor, fuel, maintenance costs, etc., the Proponent should calculate what the cost to the MBTA would be to accommodate all of the unmet transit demand and to do so in a way that meets MBTA service standards.

Potential Project impacts to the MBTA bus network are included in the transit analysis presented in Sections 5.2.1 and 5.8.1 for existing and future Build conditions, respectively.

DOT 35 The DEIR should specifically address what the operational impacts to MBTA bus service would be due to traffic generated by the Project. The MBTA assumes that the DEIR will provide a LOS analysis for all affected intersections. The MBTA requests that the DEIR present, in a tabular format, an assessment of which of these intersections are utilized by MBTA buses and how their timing or turning movements may be affected by the increased traffic and/or proposed roadway changes generated by the Project.

Potential impacts to MBTA bus service due to Project-related roadway improvements are presented in Sections 5.8.1.4.

DOT 36 For both rapid transit and bus service, the MBTA is currently constrained from offering more service during the AM and PM weekday rush hours... due to limitations of existing infrastructure... Existing ridership at these peak periods already results in overcrowded conditions throughout the MBTA network. Therefore, special note should be taken of any impacts to MBTA service from the proposed resort facility during weekday rush hours, and the DEIR should describe how any negative impacts could be mitigated.

The transit analysis in Section 5.8.1 identifies potential Project-related impacts to MBTA service during weekday rush hours.

DOT 37 The DEIR should identify, preferably in graphic format, how the facility's shuttle buses will access the Blue Line Station at Suffolk Downs... The Proponent should develop its site plan to ensure that the pickup and drop off of transit and shuttle bus passengers is seamless and easy for passengers, particularly those passengers with limited mobility.

The narrative and site plans in Section 1.1.1.5 illustrate how the shuttle bus connection at Suffolk Downs station will be enhanced.

DOT 38 The DEIR should identify, also preferably in graphic format, how pedestrians who choose to walk from the Blue Line Station or the local bus service will access the facility. The DEIR should demonstrate what the path of travel will be, and what steps will be taken to design and maintain a path of travel that is safe, accommodating, accessible and inviting.

Pedestrian connections to the Blue Line stations are presented in Section 1.1.1.5.

DOT 39 The Project site appears to be located within protected airport approach and/or transitional airspace areas as defined by state law (MGL c90 §35B) and Federal regulations (Federal Aviation Regulation Part 77)... Therefore, state and federal notice is required for the following:

- Proposed buildings;
- Proposed parking lots/parking structures;
- Proposed parking lot lights;
- Proposed permanent street lights and/or traffic lights;
- Proposed temporary installation of cranes that may be used to construct the structure/structures; and
- Proposed temporary lights that may be used during nighttime construction.

Table 3-1 identifies the anticipated permits, reviews, and approvals required for the Project; this table includes a Notice of Proposed Construction/Determination, as requested.

DOT 40 Any temporary lights that may be used during nighttime construction must be placed and aimed in such a way as to minimize glare to aircraft pilots. Light shielding must be incorporated into the design of all temporary lighting such as cranes and lighting used during nighttime construction and permanent lighting such as parking lot and traffic lights to reduce potential visual impact.

Construction-period lighting will be properly directed to minimize glare to aircraft pilots. Section 4.4 describes full-cutoff, energy-efficient site lighting.

DOT 41 Lighting and glare could occur if the Project employs reflective building materials or green technologies such as solar panels. Please ensure that any such materials are discussed with both Massport and MassDOT Aeronautics Division.

The Proponent has met with Massport and reviewed the proposed locations of the solar panels. A solar glare study is currently in progress and is discussed in Section 6.4. These issues will continue to be discussed with Massport and with MassDOT's Aeronautics Division.

DOT 42 Construction activities should be closely coordinated with Massport and the MassDOT Aeronautics Division. If temporary cranes, construction lights, or other heavy equipment will be used, or if dust and/or smoke are generated, Massport and the MassDOT Aeronautics Division must be able to ensure that appropriate notices to airmen can be issued (NOTAMS). Additionally, if cranes are to be used for construction purposes, the cranes must be appropriately marked and lighting according to U.S. Department of Transportation/FAA Advisory Circular 70/7460-1K... The temporary cranes shall also be lowered to the ground at night and/or when not in use.

The Proponent will coordinate construction activities with Massport and MassDOT and will maintain open communications with both agencies throughout the construction process. The Proponent will also comply with all federal, state, and local requirements for the transportation, erection, lighting, marking, and lowering of crane booms at night.

DOT 43 Although the Project is reducing the number of spaces compared to existing conditions, the DEIR should clarify how the parking needs of the Project were determined and explain the methodology used to determine the total parking required.

An analysis of parking demand and supply for the Project is presented in Section 5.10.

DOT 44 The DEIR should analyze the anticipated parking demand based upon parking needs and supplies for comparable facilities (based on multiple data sources, and discounted to allow for the urban location and available transit), the projected traffic demand at different times of day, the expected parking duration, and the different types of parking demand (e.g., casino patron, employee, hotel guest, etc.). The Proponent should propose parking policies that are designed to minimize parking demand and automobile use, such as fees for parking, parking cash-out policies, and other demand-reduction measures for employees.

The parking demand and supply analysis presented in Section 5.10 addresses patron and employee parking separately and takes into consideration the nature and context of the Project. Additional parking management actions and strategies are included in the TDM plan presented in Section 5.9.

DOT 45 The DEIR must include a proposed TDM program based on the Project proposal that would implement measures aimed at reducing site trip generation. The DEIR should further refine the TDM program in light of the regional context of the Project. The TDM plan should be based on the specific measures that have been successful in reducing trip generation for similar facilities, and should further investigate measures that would maximize usage of existing and new pedestrian,

bicycle, and transit facilities. Such measures should include subsidizing transit passes for both employees and patrons/hotel guests, limiting the available parking supply, providing on-site amenities and conveniences that would reduce the need for automobile travel, and shuttle services that fill unmet gaps in transit access for the proposed Project. The Proponent should provide a central, climate-controlled transit hub that is integrated into the facility so that transit provides access that is equivalent to or better than provided to patrons arriving by automobile.

A robust TDM plan is presented in Section 5.9, along with supporting site design and program elements identified elsewhere in Section 5.0 and described in more detail in Sections 1.0 and 4.0.

DOT 46 The Proponent should commit to hiring a full-time, dedicated Transportation Coordinator for the Project.

The TDM plan presented in Section 5.9 includes a commitment to designate a full-time employee as a Transportation Coordinator.

DOT 47 The DEIR should evaluate the feasibility of providing shuttle services that would run from remote parking locations within the casino market area, similar to the Logan Express Bus program that serves travelers and employees going to Logan Airport. MassDOT recommends that the Proponent investigate opportunities for partnering or emulating the existing program at Braintree, Framingham, Peabody and Woburn or other MBTA parking locations as mentioned above. To that end, the Proponent should develop a strong incentive program that would encourage both casino patrons and employees to use such services.

The proposed HOV shuttle plan for the Project is described in Section 5.8.3.2.

DOT 48 The Proponent should also seek to address the gap in overnight transportation service by reaching out to other transportation service providers such as the Massport Logan Express, internal airport shuttles, the MBTA sunrise service, the large shuttle operations within the Boston area, and the private regional/intercity bus lines that already serve South Station and other downtown destinations.

The shuttle plan described in Section 5.8.3.2 will be the primary approach to addressing the gap in overnight transit service. As part of that plan, the Proponent is committed to collaborating with other transportation providers including Massport, the MBTA, and private entities in the region.

DOT 49 The DEIR should identify what type of TDM programs will be implemented to ensure that employee use transit to the greatest degree possible. Specifically, the DEIR should identify how shifts will be scheduled so that all three shifts can utilize transit... The DEIR should describe how shifts will be laid out, and how tenants and

vendors at the facility will be encouraged to schedule shifts as well so as to promote transit usage as much as possible, while also being mindful of the weekday rush hour...

TDM measures to encourage use of transit by employees are included in the TDM plan in Section 5.9. As described in Section 5.4.2, the Resort will not have three traditional employee shifts; rather, there will be multiple shift changes throughout the day. Notwithstanding this, the Proponent has committed to adjusting employee shift times to the extent possible to reflect transit availability in the TDM plan, and to significantly limiting on-site employee parking as described in Section 5.0.

DOT 50 The DEIR should identify whether or not employee shuttles from remote locations will be used to allow employees to park and take shuttle buses to the facility. If so, the Proponent should work with the MBTA to see if a joint usage of parking facilities can be arranged at the MBTA parking locations such as the Lynn parking garage, Wellington Station, Anderson Intermodal Facility in Woburn, or other remote locations. The Proponent should work with the MBTA Parking Department to identify appropriate remote locations where a shared usage agreement can be arranged.

As described in Section 5.10.3, the Proponent proposes to shuttle employees from multiple remote locations, and will coordinate this plan with MassDOT, MBTA, Massport, and other entities to take advantage of any potential shared usage.

DOT 51 The DEIR should describe the full range of TDM proposals being considered by the Proponent and how those TDM concepts will be incorporated into the operations of the facility. The DEIR should also propose how these TDM ideas can be tracked and evaluated during operations so that they can be regularly reviewed and updated as appropriate.

The TDM plan presented in Section 5.9 incorporates a diverse range of actions, strategies, and policies including monitoring commitments to be developed in coordination with MassDOT, BTD, and others.

DOT 52 The TDM program should identify existing and proposed connections for pedestrians and bicyclists, analyze their existing and future conditions based on the Project's impacts, and commit to making improvements that will increase usage of those modes. The site plan should also provide pedestrian and bicycle connections t existing land uses within close proximity to the Project site, maximize the connectivity and permeability of the site edges, and provide excellent pedestrian and bicycle connections within the Project site. The Proponent should provide ample bicycle parking, including both secure, weather-protected bicycle parking for

employees and highly-visible bicycle parking near the entrances for customers, on-site showers, lockers, and changing facilities, and financial incentives to encourage employees and customers to walk, bicycle, or ride public transit to the site.

The TDM plan in Section 5.9 incorporates incentives for pedestrian and bicycle travel, including off-site improvements described in Sections 5.8.2 and 5.8.3. As described in Section 1.1.1.5, the Project site plan has been designed to incorporate accommodations and linkages for pedestrians and bicycles within and through the site, complemented by strong connections to surrounding land uses. Bicycle parking will be provided in accordance with BTD guidelines (see Section 5.8.3).

DOT 53 The Project Proponent should consult with MassRides, the Commonwealth's travel options service, as well as the Logan Transportation Management Association. These travel options services can help the Proponent identify potential trip reduction measures, especially those targeting employees, and support implementation of the TDM program.

The Proponent is committed to working with MassRides and the Logan TMA in the further development and refinement of the Project's TDM plan.

DOT 54 The Proponent should provide charging stations for plug-in electric vehicles, and reserve these spaces for such vehicles.

As described in Section 2.2.1, the Project includes charging stations with designated parking spaces.

DOT 55 The DEIR should identify incentives for both patrons and employees to use high occupancy vehicles, either in the form of financial incentives or priority treatments such as preferred parking spaces. The Proponent should also promote ridesharing through NuRide, the Commonwealth's web-based trip planning and Ridematching service that enables participants to earn rewards for taking "green" trips.

The TDM plan for the Project includes a variety of incentives for HOV use and ridesharing (see Section 5.9).

DOT 56 As part of the Project mitigation program, the Project Proponent should commit to implement a transportation monitoring program to be conducted upon the occupancy of the Project. The goals of the transportation monitoring program will be to evaluate the assumptions made in the DEIR and the adequacy of the transportation mitigation measures, as well as to determine the effectiveness of the TDM program. The Project Proponent shall discuss with MassDOT an appropriate timeframe for the monitoring program, or commit to initiating the monitoring program upon MassDOT's request... If the traffic monitoring program indicates that the proposed mitigation is not effective in accommodating the future traffic volumes

at key area intersections impacting the state highway system, the Project Proponent will be responsible for identifying and implementing operational improvements at these constrained locations.

The TDM plan includes monitoring commitments to be developed in coordination with MassDOT, BTD, and others (see Section 5.9).

THE COMMONWEALTH OF MASSACHUSETTS
EXECUTIVE OFFICE OF ENERGY AND ENVIRONMENTAL AFFAIRS
OFFICE OF COASTAL ZONE MANAGEMENT
251 Causeway Street, Suite 800, Boston, MA 02114-2136
(617) 626-1200 FAX: (617) 626-1240

MEMORANDUM

TO: Richard K. Sullivan, Secretary, EEA
ATTN: Deirdre Buckley, MEPA Unit
FROM: Bruce Carlisle, Director, CZM
DATE: March 26, 2013
RE: EEA 15006 – Caesars Resort at Suffolk Downs

The Massachusetts Office of Coastal Zone Management (CZM) has completed its review of the above-referenced Environmental Notification Form (ENF), noticed in the *Environmental Monitor* dated February 6, 2013 and recommends that the following issues be addressed in the Draft Environmental Impact Report (DEIR).

Project Description

The project site is the 161 acre Suffolk Downs site, New England's only operating thoroughbred racetrack, located in East Boston and Revere. The site includes a grandstand and clubhouse buildings, one-mile racetrack, horse stables for approximately 1,000 horses, parking, and maintenance facilities. Portions of the project site are located in the Rumney Marshes Area of Critical Environmental Concern (ACEC) including Sales Creek as it flows through the site and discharges into the Belle Isle Inlet. The ENF states that a previous ENF for the site filed in May 2011 included a stormwater separation project that was completed in 2012 as required by the U.S. Environmental Protection Agency for an Individual National Pollutant Discharge Elimination System Permit for Concentrated Animal Feeding Operations. The new wastewater drainage system provides drainage from the stable area to a retention pond inside the racetrack, within both the 100 foot buffer zone and the Riverfront Area. The wastewater is then pumped from the retention pond to the Boston Water and Sewer Commission's (BWSC) sanitary sewer system within Walley Street. Stormwater from stable rooftops is collected and discharged into existing drain systems to Sales Creek.

The proposed project includes the redevelopment of the site and the construction of two gaming areas, up to 450 guest rooms in two hotels, a multi-purpose meeting/entertainment space, dedicated covered parking, a central utility plant, fine dining, and retail space. The ENF states that the racetrack will continue to operate and the project will also involve ongoing maintenance in the existing horse barn area which will include replacing or improving horse barns as necessary. Primary access to the site is from Route 1A in East Boston. Additional access is provided from Winthrop Avenue at the northern end of the property. The site is also served by the MBTA Blue Line with both the Suffolk Downs and Beachmont stops adjacent to the site. The project includes roadway improvements, landscaping, and an on-site stormwater management system.

Project Comments

CZM commends the proponent for their commitment to sustainable design with a goal of LEED Gold and sustainable approach on floodplain management, sea level rise, greenhouse gas emissions, and climate change preparedness. A commitment to sustainable design is especially important in this location, as a portion of the project site is located within the Rumney Marshes ACEC, including Sales Creek and a portion of the track and stable areas. As such, a higher level of scrutiny applies to the proposed project and its effects on each of the public interests listed in the Secretary's designation of the Rumney Marshes ACEC; flood control, the prevention of storm damage, the protection of land containing shellfish and fisheries, the prevention of pollution, the protection of wildlife habitat, and the protection of public and private water supplies.

CZM recommends that additional information on the proposed stormwater system be included in the DEIR. Plans should include elevation contours, locations and types of best management practices, existing and proposed drainage patterns, and detailed information about wetland construction and function. **CZM 01** Water quality improvements are listed in the ENF as a public benefit from the proposed project and CZM recommends that the DEIR include details about how the project will provide these water quality improvements on site, particularly in the stable area where stormwater management will directly affect water quality in Sales Creek and the Rumney Marshes ACEC. **CZM 02** While the recent improvements to the stable area to separate stormwater and waste water will provide water quality improvements for the most frequent storm events, a greater than 25 year storm event would result in wastewater spilling over into Sales Creek. **CZM 03** Considering the proponent's commitment to sustainable, green design, CZM recommends that the DEIR include details regarding upgrades to the horse barns and any stable area stormwater improvements proposed to address this issue. Stormwater system design included in the DEIR should consider projections in increased precipitation resulting from climate change. **CZM 04**

CZM commends the project proponent for considering the impacts of sea-level rise on the proposed project. The ENF states that the National Oceanic and Atmospheric Administration estimate a sea level rise of approximately .87 feet over the next century. However, these data actually reflect the .87 feet of sea level rise that has occurred over the last century according to tidal gauge data, and represent historic records, not projections. While the National Coastal Vulnerability Index (CVI) provides insight into the relative potential of coastal change due to sea level rise and highlights regions where various effects of sea level rise may be greatest, the CVI was applied to our region in 1999 and only provides a broad scale view of potential impacts. The Massachusetts Climate Change Adaptation Report (2011) presents projections of sea level rise over a range of scenarios by 2050 and 2100. The Intergovernmental Panel on Climate Change projections are recognized as too conservative, so the Rahmstorf low (20") and middle emissions scenarios (32") by 2100 are reasonable starting points for adaptation efforts. At a minimum, CZM recommends all projects evaluate impacts of two feet of sea level rise. **CZM 05** According to the ENF, the proposed new buildings would have ground floors well above the BFE, but more details are needed to evaluate the effect of sea level rise on the site comprehensively with attention to existing buildings, the track and stable area, and proposed stormwater management system.

Federal Consistency Review

The proposed project may be subject to CZM federal consistency review, and therefore must be found to be consistent with CZM's enforceable program policies. **CZM 06** For further information on this process, please contact Robert Boeri, Project Review Coordinator, at 617-626-1050, or visit the CZM web site at www.mass.gov/czm.

Ben Lynch, DEP Waterways
Nancy Baker, MassDEP
Stephanie Kruel, Boston Conservation Commission
Andrew DeSantis, Revere Conservation Commission

CZM 01 **CZM recommends that additional information on the proposed stormwater system be included in the DEIR. Plans should include elevation contours, locations and types of BMPs, existing and proposed drainage patterns, and detailed information about wetland construction and function.**

Section 9.3 describes the Project's drainage design.

CZM 02 **Water quality improvements are listed in the ENF as a public benefit from the proposed project and CZM recommends that the DEIR include details about how the project will provide these water quality improvements on site, particularly in the stable area where stormwater management will directly affect water quality in Sales Creek and the Rumney Marshes ACEC.**

The 2.3-acre portion of the stable area that will be used for parking will no longer be considered part of the CAFO following construction; therefore, stormwater from this area will discharge to the proposed stormwater system and not to the recently-constructed sanitary system (see Section 9.3).

CZM 03 **While the recent improvements to the stable area to separate stormwater and wastewater will provide water quality improvements for the most frequent storm events, a greater than 25-year storm event would result in wastewater spilling over into Sales Creek... CZM recommends that the DEIR include details regarding upgrades to the horse barns and any stable area stormwater improvements proposed to address this issue.**

Suffolk Downs' CAFO generates three water-related discharges. The first stems from precipitation that falls on stable buildings, which is diverted into gutters, downspouts, and drain lines without any contact with horses. The second results from precipitation that falls on the stable grounds (i.e., "process water," and not "wastewater"), which runs into ground-level catch basins and drain lines that lead to a holding pond and thereafter enters the BWSC sewer system. The third consists of a minor amount of sanitary sewage, which remains within dedicated sewer lines at all times. The pond constructed by Suffolk Downs in 2011-2012 is designed to hold all of the process water generated by the CAFO and has the capacity to accommodate a 50-year storm event. The pond's design exceeds EPA regulatory requirements under the federal Clean Water Act, which call for a holding pond sized only for a 25-year event. MassDEP has certified to EPA, in connection with Suffolk Downs' application for a NPDES permit, that use of a holding pond to capture all process water generated up to a 50-year storm event allows Suffolk Downs to meet all applicable state water quality anti-degradation standards.

CZM 04 **Stormwater system design included in the DEIR should consider projections in increased precipitation resulting from climate change.**

The Proponent is reviewing and considering all aspects of climate change as the Project design progresses; Section 2.3 describes climate change adaptation.

CZM 05 **At a minimum, CZM recommends all projects evaluate impacts of two feet of sea level rise. According to the ENF, the proposed new buildings would have ground floors well above the BFE, but more details are needed to evaluate the effect of sea level rise on the site comprehensively with attention to existing buildings, the track and stable area, and proposed stormwater management system.**

Section 2.3 describes the Resort's climate change adaptation measures.

CZM 06 **The proposed project may be subject to CZM federal consistency review, and therefore must be found to be consistent with CZM's enforceable project policies.**

The list of anticipated permits, reviews, and approvals is provided in Table 3-1. As currently proposed, the Project does not require any federal actions that are subject to the CZM's federal consistency requirement. This fact notwithstanding, information demonstrating consistency with CZM's enforceable policies is provided in Section 6.8.

03-28-2013
Caesars Resort at Suffolk Downs
ENF - Stationary GHG Sources
DOER Comments
JJ Ballam

The DOER would like to acknowledge the level of detail of the description included in the ENF. The DOER notes that a "sustainable design / green building "is one of the benefits to be provided to the community by the project. The DOER reminds the proponent that a primary element of any green building design is to limit the amount the emission of greenhouse gasses by adopting measures that will reduce the consumption of electricity and non-renewable fuels to the lowest amount feasible. In addition, the DOER commends the proponent on identifying a related goal of providing a project that will serve an example of sustainable design and operation to the surround communities and visiting public.

Effective Code:
Boston has adopted the Mass Stretch Energy Building Code (SC). For projects to be located in jurisdictions which have adopted the SC, the MEPA Policy and Protocol (Policy) requires that the energy modeling of the baseline and as-proposed (as-designed) cases of all proposed buildings with areas greater than 100,000 sf be performed in compliance with the rules and methods as contained in the ASHRAE standard 90.1 – 2007 appendix G (energy only).

The DEIR:

With respect to the stationary sources of GHG, the DEIR should comply fully with MEPA's GHG Policy and Protocol (the Policy), and include at minimum the following: **DOER 01**

- A detailed description of the as-proposed project with emphasis on the envelope, mechanical and electrical systems for each building.

- A description of all the design and or operating measures that were evaluated. These should categorized as either adopted, under further consideration, to be considered post FEIR, or rejected. Discussion of the reasons for not adopting a measure under consideration should be included.

- A description of the building energy simulation model and procedures utilized.

- A detailed and complete table of modeling inputs showing the item and the input value for both the base and as-designed scenarios. The area of the building should be included.

- The output of the model showing the monthly and annual energy consumption, totalized and by major end use system.

- If e-QUEST is to be used, the project modeling files should be submitted on a flash drive.

Based on the information as submitted, the project as described provides both a challenge and an opportunity. The challenge is due to the presence of factors which drive energy consumption some of which are:

- A 24/7 operating schedule
- Large open gaming rooms with high density occupancy which will drive ventilation, lighting and plug loads.
- A hotel with large hot water and standby loads.
- A large of amount of glass curtain wall.

The opportunities include:

General:

Building Envelope:

- For any wall for which the glazed area exceeds 50% of the total area, select high performance glazing systems with insulating, emissivity and solar heat gain factors which exceed the minimum code performance by at least 30%. **DOER 02**
- Careful analysis of sources and minimization of uncontrolled infiltration

HVAC

- Selection of equipment with rated efficiencies well above the code required minimum. **DOER 03**
- Minimization of pressure drops for all duct and pipe systems.
- Provide enough thermal zones to enable a sufficient level of discreet control.

Electrical:

- Selection of highly efficient (including LED) units **DOER 04**
- Custom (as opposed to plan) layout of lighting fixtures
- Use of Energy Star rated machines and appliances throughout.
- Ensure that energy consumption is a factor in the selection of special equipment (such as slot machines).
- Design of distribution system to minimize feeder losses and maximize power factor.

Adoption of on-site renewable energy

Energy Management System: An EMS will be critical to the success of operating the project to maintain the as-designed performance. **DOER 05**

Independent Commissioning of project systems.

Central Plant:

Adopt CHP (with absorption chillers) sized to meet the heating and cooling loads of the project campus. Include the substantial CAPex and performance based incentives available to qualified CHP systems in Mass. when evaluating the economic feasibility. **DOER 06**

As the resort will be a facility serving a large number of visitors at any given time, careful consideration should be paid to the its ability to withstand the impact of loss of grid power especially in conjunction with a flood condition, such as would be possible in a storm similar to the recent "Sandy". **DOER 07**

Consideration should also be given to the possible use of the buildings as a safe haven for the public use during an extreme event.

In either scenario, adoption of a CHP central plant system that will be able to continue to supply off-grid power, heat and cooling during such an eventuality would be a critical asset.

Oversize cooling towers.

Use variable speed drives for all motors.

Casino

Reduction of ventilation driven HVAC loads: **DOER 08**

- Adoption of both demand controlled and energy recovery ventilation.

Hotel

- Adoption of water source heat pumps for guest rooms

MASSACHUSETTS DEPARTMENT OF ENERGY RESOURCES

DOER 01 With respect to the stationary sources of GHG, the DEIR should comply fully with MEPA's GHG Policy and Protocol (the Policy), and include at minimum the following:

- A detailed description of the as-proposed Project with emphasis on the envelope, mechanical and electrical systems for each building.
- A description of all the design and/or operating measures that were evaluated. These should be categorized as either adopted, under further consideration, to be considered post-FEIR, or rejected. Discussion of the reasons for not adopting a measure under consideration should be included.
- A description of the building energy simulation model and procedures utilized.
- A detailed and complete table of modeling inputs showing the item and the input value for both the base and as-designed scenarios. The area of the building should be included.
- The output of the model showing the monthly and annual energy consumption, totalized and by major end use system.
- If e-QUEST is to be used, the Project modeling files should be submitted on a flash drive.

Please see the GHG analysis in Section 7.0 and Attachment D.

DOER 02 Opportunities [regarding building envelope] include:

- For any wall for which the glazed area exceeds 50% of the total area, select high performance glazing systems with insulating, emissivity and solar heat gain factors which exceed the minimum code performance by at least 30%.
- Careful analysis of sources and minimization of uncontrolled infiltration.

Glazing performance values are provided in Attachment D.1. Infiltration control is an integral part of any design development.

DOER 03 Opportunities [regarding HVAC] include:

- Selection of equipment with rated efficiencies well above the code-required minimum.
- Minimization of pressure drops for all duct and pipe systems.
- Provide enough thermal zones to enable a sufficient level of discrete control.

The HVAC design will include equipment with efficiencies above code-required minimums, relatively low pressure drops through air systems, and a relatively high number of thermostatic control zones (see also Attachment D.1).

DOER 04 Opportunities [regarding electrical] include:

- Selection of highly-efficient (including LED) units.
- Custom (as opposed to plan) layout of lighting fixtures.
- Use of Energy Star rated machines and appliances throughout.
- Ensure that energy consumption is a factor in the selection of special equipment (such as slot machines).
- Design distribution system to minimize feeder losses and maximize power factor.

These items are discussed in the GHG analysis in Section 7.0.

DOER 05 An [Energy Management System] will be critical to the success of operating the Project to maintain the as-designed performance.

EMS are addressed in Section 7.2.8. An EMS is included in the building design and will allow the operator to monitor performance of mechanical and electrical building systems. In addition, provisions for metering of power uses will be incorporated into the electrical design.

DOER 06 Adopt CHP (with absorption chillers) sized to meet the heating and cooling loads of the Project campus. Include the substantial CAPex and performance-based incentives available to qualified CHP systems in Massachusetts when evaluating the economic feasibility.

These items are discussed in the GHG analysis in Section 7.0. CHP is included in the building design. Waste heat will be used to generate domestic hot water while the generated electricity will power building systems. This configuration will result in high overall efficiency because the domestic water heat load is a good "base load," available throughout the year as a heat sink. Larger CHPs and absorption chilling were considered but were rejected due to aesthetic, maintenance, and reliability concerns, CUP facility concept mismatch, and economics (see Section 7.4.2).

DOER 07 As the resort will be a facility serving a large number of visitors at any given time, careful consideration should be paid to its ability to withstand the impact of loss of grid power especially in conjunction with a flood condition... Consideration should also be given to the possible use of the buildings as a safe haven for the public use

during an extreme event. In either scenario, adoption of a CHP central plant system that will be able to continue to supply off-grid power, heat and cooling during such an eventuality would be a critical asset.

The facility will have emergency, life safety, and select additional loads (e.g., heating capacity, critical space cooling [e.g., server rooms], and some refrigerated food storage) backed up by emergency generators (4 megawatts of installed capacity are anticipated). In addition, the critical infrastructure (e.g., generators, heating plant, cooling plant, and air handling capacity) will be located above the 100-year floodplain. These measures will help the facility withstand a flood in conjunction with loss of grid power, and help the facility serve as a safe haven.

DOER 08 [Opportunities for the casino building associated with] reduction of ventilation-driven HVAC loads [include]: adoption of both demand-controlled and energy recovery ventilation.

These items are discussed in the GHG analysis in Section 7.2. Both demand-controlled ventilation and energy recovery will be used in the HVAC design associated with the casino and other buildings.

DOER 09 [Opportunities for the hotel include] adoption of water source heat pumps for guest rooms.

WSHPs are discussed in the GHG analysis in Section 7.4.2.

Boston MA 02114

ATTN: Dierdre Buckley, MEPA Unit

RE: Caesars Resort at Suffolk Downs, Suffolk Downs Racecourse, Rt 1A McCellan Hwy, Boston (East Boston) & Revere, MA; MHC# RC.53753, **EEA# 15006**

Dear Secretary Sullivan:

The Massachusetts Historical Commission (MHC) is in receipt of an Environmental Notification Form (ENF) for the project referenced above. The staff of the Massachusetts Historical Commission (MHC) has reviewed the information submitted and has the following comments.

This project proposes the construction of two distinct gaming areas, referred to as Casino Area I and Casino Area II, to include up to 450 guestrooms in two hotels, a multi-purpose meeting/entertainment space, dedicated covered parking, fine dining, and retail space. The ENF discloses that the project will require permits and/or licenses from the Massachusetts Gaming Commission, the Massachusetts Department of Transportation (MassDOT) Highway Division, the Department of Conservation and Recreation (DCR), and the Massachusetts Water Resources Authority (MWRA).

The proposed project also involves changes to the existing buildings associated with the Suffolk Downs racetrack, including renovation of the Grandstand and Clubhouse, demolition of the existing link between the Grandstand and Clubhouse, demolition of the Office Building and Utility Building, and retention of the existing horse barns.

The Suffolk Downs Clubhouse, Grandstand, and Racetrack (BOS.209) are included in MHC's *Inventory of Historic and Archaeological Assets of the Commonwealth* and may meet the criteria of eligibility for listing in the State and National Registers of Historic Places. Additional information would be required for the MHC to fully evaluate the property, including an updated MHC Form A (Area Form) complete with current color photographs of all extant buildings and features, together with dates of construction and alterations, if available. The MHC requests that this information be submitted prior to the filing of the Draft Environmental Impact Report (DEIR), if possible, in order for the MHC to determine whether these historic properties are eligible for listing in the National and State Registers of Historic Places. **MHC 01**

The project location is immediately adjacent to the Revere Beach Parkway (REV.H), which is listed in the State and National Registers of Historic Places. It is unclear from the submission if the proposed project will require alterations to this historic resource. The MHC requests that the DEIR clearly identify any and all potential alterations to the Revere Beach Parkway. **MHC 02**

220 Morrissey Boulevard, Boston, Massachusetts 02125
(617) 727-8470 • Fax: (617) 727-5128
www.sec.state.ma.us/mhc

These comments are offered to assist in compliance with Section 106 of the National Historic Preservation Act of 1966 (36 CFR 800), M.G.L. Chapter 9, Section 26-27C, (950 CMR 71.00) and MEPA (301 CMR 11). Please do not hesitate to contact Brandee Loughlin of my staff if you have any questions.

Sincerely,

Brona Simon

Subject: Environmental Notification Form - EOEEA #15006
Caesars Resort at Suffolk Downs, East Boston and Revere, MA

Dear Secretary Sullivan:

The Massachusetts Water Resources Authority (MWRA) appreciates the opportunity to comment on the Environmental Notification Form (ENF) for the Caesars Resort at Suffolk Downs (the Project) in East Boston and Revere proposed by Sterling Suffolk Racecourse, LLC, (the Proponent). The Proponent is the owner of the 161-acre site where it currently operates the historic Suffolk Downs, a thoroughbred horse racing facility (the property). The proposed mixed use development would use the majority of the open space at the site, including the racetrack and infield area (which will be preserved as part of the proposed casino development. The Project calls for the development of two distinct gaming areas (referred to as "Casino Area I" and "Casino Area II"), up to 450 guestrooms in two hotels, a multi-purpose meeting/entertainment space, dedicated covered parking, fine dining, and retail space. The project construction will commence following receipt of the gaming license and necessary permits.

The project includes major off-site roadway, traffic and safety improvements which are in the planning stage to be designed in consultation with the Massachusetts Department of Transportation (MassDOT) and City of Boston including Boardman Street improvements and a Route 1A flyover, and an additional southbound lane on Route 1A. Improvements are also proposed to the Route 1/ Route 16 interchange along Revere Beach Parkway, and in the cities of Revere and Chelsea to address long-standing regional traffic issues and these issues will be addressed in the Draft Environmental Impact Report (DEIR).

MWRA comments focus on issues related to wastewater flows, sewer discharge permitting within the Toxic Reduction and Control (TRAC) Department and the potential need for an 8 (M) Permit from the Water Permitting Field Operations Group.

Wastewater Flows

According to the ENF, sanitary sewage generated by the Project will be collected at two proposed on-site sewage pumping stations, which will discharge their flows to Boston Water and Sewer Commission (BWSC) sewers that drain to BWSC's East Boston Low Level

Printed on 100% Recycled Paper

Sewer (EBLLS), along with the flows from Concentrated Animal Feed Operations (CAFO) associated with the horse racing. The EBLLS is a 24-inch sewer at its upstream end near the MBTA Suffolk Downs station and becomes a 30-inch sewer a short distance away on Leverett Avenue, then proceeds as a 36-inch sewer in an easterly direction generally parallel to or within the right of way of Bennington Street. Along the way, the EBLLS collects sanitary flows from lower lying areas of East Boston, many created by historical land filling.

The EBLLS increases to a 39-inch by 54-inch sewer and eventually discharges its accumulated flows to MWRA's Caruso Pump Station located adjacent to the Chelsea Creek at the Chelsea Street Bridge. Caruso Pump Station lifts its flows into MWRA's North Metropolitan Trunk Sewer, which conveys the flows to the Deer Island treatment plant. There are no combined sewer overflows (CSO) along the EBLLS or along local systems connected to the EBLLS, though there once was a CSO outfall (BOS002/MWR207) on the tributary BWSC Moore Street Interceptor. This CSO was closed by BWSC in 2000 in accordance with MWRA's long-term CSO control plan which called for eliminating CSO discharges to Constitution Beach. The closing of this outfall ended CSO discharges to the beach and allowed MWRA to decommission its Constitution Beach CSO treatment facility.

In addition to receiving flows from the EBLLS, the Caruso Pump Station receives flows from MWRA's East Boston Branch Sewer (EBBS), as well as wet-weather related overflows from MWRA's Chelsea Screen House and Chelsea Creek Headworks, both located on the Chelsea side of Chelsea Creek, in large storms. The EBBS in East Boston and sewers tributary to the Chelsea facilities can overflow at several BWSC and City of Chelsea CSO outfalls to the Chelsea River and the Inner Harbor when flows exceed pipe capacities or when total flow to the Caruso Pump Station exceeds its pumping capacity. Higher flows to the tributary systems, including higher flows to the EBLLS from the Project, will contribute higher flows to Caruso Pump Station in large storms, potentially increasing CSO discharges. **MWRA 01**

The results of hydraulic model investigations conducted last year by MWRA when Suffolk Downs proposed to add CAFO flows to the BWSC and MWRA systems also show that the capacity of the EBLLS can be exceeded in large storms, due to high volumes of infiltration (groundwater) and inflow (stormwater) that can enter the otherwise separate sanitary sewer system. Surcharging of the EBLLS potentially contributes to local system backups that could put lower lying areas, like the neighborhoods tributary to the Moore Street Interceptor, at risk. In large storms, the primary contributors to surcharging are backwater from Caruso Pump Station and local capacity limitations in the EBLLS, especially immediately downstream of the Moore Street Interceptor Connection. MWRA responded to these findings and potential risks by including in the CAFO discharge permit a condition requiring Suffolk Downs to install a flow depth sensor, monitor hydraulic conditions in the EBLLS, and suspend its CAFO discharges when wet weather flows in the EBLLS rise to near-full-pipe capacity. According to the ENF, the Proponent plans to work with BWSC to evaluate the performance of the BWSC sewer system and the effects of the higher sanitary flows that will be generated by the Suffolk Downs project. **MWRA 02**

The ENF reports that the project will increase wastewater flow from the Suffolk Downs site by 307,080 gallons per day (gpd) – 185% of the current 166,020 gpd sanitary

flow. The ENF also reports that Suffolk Downs discharges 150,000 gpd of CAFO flow to the EBLLS system. MWRA is implementing an $860 million program of local and regional wastewater system improvements to control CSOs and improve receiving water quality, including water quality in Chelsea Creek and Boston Inner Harbor. The impacts of new sanitary flows to the local sewers and MWRA facilities should be fully offset to help ensure that the benefits of CSO control, including water quality improvement, will be realized and sustained for the long term.

To avoid increasing CSO discharges or otherwise compromising CSO control goals, the Proponent should fully offset new flows to the sewer system with infiltration/inflow ("I/I") removal or sewer separation (i.e. stormwater inflow reduction) in a hydraulically related sewer system(s). Any net increase of flow should be mitigated in strict compliance with MassDEP's Policy on Managing Infiltration and Inflow in MWRA Community Sewer Systems (BRP 09-01) and with BWSC policy and regulations. BWSC has offset requirements that should be satisfied to ensure that the new sanitary flows will not contribute to higher CSOs or other system problems. The DEIR should describe how the Proponent will satisfy these requirements. **MWRA 03**

TRAC Discharge Permitting

The MWRA prohibits the discharge of groundwater to the sanitary sewer system, pursuant to 360 C.M.R. 10.023(1) except in a combined sewer area when permitted by the Authority and the municipality. The proposed Project will have access to a storm drain and it is not located in a combined sewer area; therefore, the discharge of groundwater to the sanitary sewer system is prohibited. The Proponent will need to secure a USEPA-NPDES General Permit for Storm Water Discharges from its construction activities. **MWRA 04**

The Proponent currently holds an MWRA Sewer Use Discharge Permit (#49403698, Category 01, Significant Industrial User), and is subject to the National Categorical Pretreatment Standards, 40 C.F.R. 412 - Concentrated Animal Feeding Operations (CAFO) Point Source Category, Subpart A-Horses and Sheep Subcategory 412.10. Sterling Suffolk Racecourse, LLC, will need to continue to adhere to its Sewer Use Discharge Permit that authorizes the discharge from the animal feeding and handling areas. If Sterling Suffolk Racecourse, LLC, intends to change its current operation(s) and/or discharge(s) such as increasing its daily wastewater discharge flow from the animal feeding and handling areas and support activities, the Proponent must provide at least 30 days advance written notification to John Norton, Jr., Industrial Coordinator, MWRA, TRAC, 2 Griffin Way, Chelsea, MA 02150. The notification is required before it takes any action which may substantially change the volume or nature of its discharge including an increase of daily discharge flow or character of pollutants in its discharge, from any compliance measurement location or any sewer connection. **MWRA 05**

Once the hotels are completed and if the Proponent intends to operate a laundry on the premises, a Sewer Use Discharge Permit is required from the MWRA for the discharge of laundry effluent into the sanitary sewer system. For assistance in obtaining this permit, a representative from the hotel should contact Mr. John Norton, Jr., Industrial Coordinator within the TRAC Group at (617) 305-5656. The Proponent must have an MWRA Sewer Use Discharge Permit prior to discharging wastewater from its laundry operations into the MWRA sanitary sewer system. **MWRA 06**

Lastly, the Proponent must also comply with 360 C.M.R. 10.016, if it intends to install gas/oil separator(s) in the enclosed car parking garages. In addition to complying with 360 C.M.R. 10.000, the Proponent will need to conform to the regulations of the Board of State Examiners of Plumbers and Gas Fitters, 248 C.M.R. 2.00 (State Plumbing Code), and all other applicable laws. The installation of the proposed gas/oil separator(s) will require MWRA approval and may not be back filled until inspected and approved by the MWRA and the Local Plumbing Inspector. For assistance in this approval, the Proponent should contact Mr. Thomas J. Coffey, Source Coordinator at (617) 305-5624. **MWRA 07**

Section 8 (m) Permitting

Section 8 (m) of Chapter 372 of the Acts of 1984, MWRA's Enabling Legislation, enables the MWRA to issue permits to build, construct, excavate, or cross within or near an easement or other property interest held by the MWRA, with the goal of protecting Authority-owned infrastructure. The project includes an upgrade to the existing water connection in Waldemar Avenue and a second connection located near Route 1A entrance.

MWRA has section 97A and Section 55 water mains near the entrance to the project in Boston. There are also Sections 16, 69 and 97 and 97A in Revere. It is likely that the Proponent will need an MWRA 8(m) permit. We encourage the Project Proponent and/or their consultants to contact Mr. Ralph Francesconi within MWRA's Water Permitting Group at (617) 350-5827 for permitting assistance early in the design process. **MWRA 08**

Should you have any questions or need additional information on these comments please feel to contact me at (617) 788-1165.

Sincerely,

Marianne Connolly

MASSACHUSETTS WATER RESOURCES AUTHORITY (MWRA)

MWRA 01 In addition to receiving flows from the EBLLS, the Caruso Pump Station receives flows from MWRA's East Boston Branch Sewer (EBBS), as well as wet-weather-related overflows from MWRA's Chelsea Screen House and Chelsea Creek Headworks, both located on the Chelsea side of Chelsea Creek, in large storms. The EBBS in East Boston and sewers tributary to the Chelsea facilities can overflow at several BWSC and City of Chelsea CSO outfalls to the Chelsea River and the Inner Harbor when flows exceed pipe capacities or when total flow to the Caruso Pump Station exceeds its pumping capacity. Higher flows to the tributary systems, including higher flows to the EBLLS from the Project, will contribute higher flows to Caruso Pump Station in large storms, potentially increasing CSO discharges.

The Proponent is continuing to work with BWSC and the MWRA regarding mitigation for increases in wastewater flows (see Section 9.1).

MWRA 02 The results of hydraulic model investigations conducted last year by MWRA... also show that the capacity of the EBLLS can be exceeded in large storms due to high volumes of infiltration (groundwater) and inflow (stormwater) that can enter the otherwise separate sanitary sewer system. Surcharging of the EBLLS potentially contributes to local system backups that could put lower lying areas... at risk... The ENF reports that the Project will increase wastewater flow from the Suffolk Downs site by 307,080 gpd – 185% of the current 166,020 gpd sanitary flow. The ENF also reports that Suffolk Downs discharges 150,000 gpd of CAFO flow to the EBLLS system. MWRA is implementing an $860 million program of local and regional wastewater system improvements to control CSOs and improve receiving water quality... The impacts of new sanitary flows to the local sewers and MWRA facilities should be fully offset to help ensure that the benefits of CSO control, including water quality improvement, will be realized and sustained for the long term.

The Proponent is continuing to work with BWSC and the MWRA to provide mitigation for increases in wastewater flows (see Section 9.1).

MWRA 03 To avoid increasing CSO discharges or otherwise compromising CSO control goals, the Proponent should fully offset new flows to the sewer system with I/I removal or sewer separation (i.e., stormwater inflow reduction) in a hydraulically related sewer system(s). Any net increase of flow should be mitigated in strict compliance with MassDEP's Policy on Managing Infiltration and Inflow in MWRA Community Sewer Systems (BRP 09-01) and with BWSC policy and regulations.

The Proponent is continuing to work with BWSC and the MWRA to provide mitigation for increases in wastewater flows (see Section 9.1).

MWRA 04 **The proposed Project will have access to a storm drain and it is not located in a combined sewer area; therefore, the discharge of groundwater to the sanitary sewer system is prohibited. The Proponent will need to secure a USEPA NPDES General Permit for Storm Water Discharges from its construction activities.**

The Project will not discharge any stormwater to a sanitary line or a combined sewer overflow. The net stormwater generated from the site will decrease relative to existing conditions. The Proponent will seek a NPDES General Permit from EPA. A draft SWPPP is provided as part of the Stormwater Report included in Attachment F.

MWRA 05 **Sterling Suffolk Racecourse, LLC will need to continue to adhere to its Sewer Use Discharge Permit that authorizes the discharge from the animal feeding and handling areas. If Sterling Suffolk Racecourse, LLC intends to change its current operation and/or discharge such as increasing its daily wastewater discharge flow from the animal feeding and handling areas and support activities, the Proponent must provide at least 30 days in advance written notification to John Norton, Jr., Industrial Coordinator, MWRA, TRAC, 2 Griffin Way, Chelsea, MA 02150. The notification is required before it takes any action which may substantially change the volume or nature of its discharge including an increase of daily discharge flow or character of pollutants in its discharge, from any compliance measurement location or any sewer connection.**

Suffolk Downs understands that it must fully comply with the terms of its Sewer Use Discharge Permit.

MWRA 06 **Once the hotels are completed and if the Proponent intends to operate a laundry on the premises, a Sewer Use Discharge Permit is required from the MWRA for the discharge of laundry effluent into the sanitary sewer system.**

A laundry system will not be operated on the premises.

MWRA 07 **The Proponent must also comply with 360 CMR 10.016 if it intends to install gas/oil separators in the enclosed car parking garage. In addition to complying with 360 CMR 10.000, the Proponent will need to conform to the regulations of the Board of State Examiners of Plumbers and Gas Fitters, 248 CMR 2.00 (State Plumbing Code) and all other applicable laws.**

The Project will include installation of gas/oil separators in the parking garage; these separators will comply with all applicable regulations.

MWRA 08 **MWRA has Section 97A and Section 55 water mains near the entrance to the Project in Boston. There are also Sections 16, 69, 97 and 97A in Revere. It is likely that the Proponent will need an MWRA 8(m) permit.**

The Project will connect to the existing water line in Waldemar Avenue south of the Project site. The Proponent will continue to work with the MWRA and will apply for an 8(m) permit if required.

Re: Caesars Resort at Suffolk Downs/EEA 15006 East Boston and Revere, Massachusetts

Dear Secretary Sullivan:

On behalf of the Massachusetts Port Authority (Massport), we thank you for the opportunity to submit comments on the Environmental Notification Form (ENF) submitted by Sterling Suffolk Racecourse, LLC for the proposed Caesars Resort at Suffolk Downs on a 161-acre site in the City of East Boston and the City of Revere. As owners and operators of Boston Logan International Airport and as a property owner of parcels along Route 1A directly abutting the proposed casino site, we are keenly interested in the project and its transportation, facility design and operational features. Our ENF comments are focused on those details and project elements that should be thoroughly evaluated in the forthcoming Draft Environmental Impact Report.

We are pleased that the Suffolk/Caesars has reached out to Massport on several occasions as its project planning has evolved; we also note that we have also coordinated our comments directly with MassDOT through their Highway and Aeronautics divisions. That coordination has provided us with an excellent project understanding. Based on those meetings and our review of the ENF, we understand that the casino resort will include the following major elements:

- Approximately 200,000 square feet of casino gaming space
- 2 high-rise hotels totaling 300-450 rooms; one tower of 135 feet, a second of 166 feet
- Multi-purpose meeting/entertainment space and 16 restaurants
- Approximately 30,000 square feet of retail space
- Central Utility Plant
- A total of 5,150 parking spaces: approximately 2,600-spaces in a seven-story parking garage, one level of underground parking for approximately 450 cars, and approximately 2,100 surface parking spaces. This is a reduction from the existing 6000 surface spaces
- Retained horse race track
- Daily trip generation estimated at 40,500 (24,600 new daily trips compared to existing)
- An estimated 4,000 permanent jobs to be created.

As described below, Massport's principle interests focus on the continued safe and efficient operation of Logan Airport with a high level of customer service. In particular, we look to see that the Draft EIR carefully focuses on local and regional traffic and transportation, building heights as they relate to Logan Airport arrival and departure patterns, lighting and potential solar glare that could be associated with building exteriors or solar panel arrays and energy utilization. We further note that a successful casino resort will add significant new jobs to the regional economy; to the extent those service jobs overlap with airport jobs, it will be critical for Massport and Suffolk/Caesars to closely coordinate.

Our detailed recommendations for the EIR Scope are as follows:

Casino Demographics/Long-Range Plans. The Draft EIR should carefully define the casino resort's customer base. This information will be critical to understanding the market area for the facility and likely access/egress patterns and modes of transportation. It will be important that the planning for the casino be informed by Massport's recent long-range forecasts on air passenger activity through 2030. The Draft EIR should also discuss any potential expansion plans for the 161-acre site; will the proposed site plan be constructed in phases and are there future expansion plans? The Draft EIR should also discuss any current or future plans the resort may have for a helipad. **MPT 01** **MPT 02** **MPT 03**

Traffic/Transportation. Because of Suffolk Downs proximity to Logan Airport, the development of a resort casino could have a direct impact on the transportation system (highways and transit) that provides access to the airport. We share Suffolk/Caesars transportation goals that resort traffic must be encouraged to use major arterials and discouraged from using neighborhood roads. The scope of the transportation analysis should be regional in nature and reflect the catchment area for patrons and employees. The geographic scope should be based on the Caesars marketing study and gravity model, both of which should be documented in the EIR. While the proper geographic scope of the transportation systems analysis is most appropriately defined by MassDOT, we believe that the Route 1A-Ted Williams Tunnel corridor deserves careful attention, as does the capacity and operation of the MBTA Rapid Transit Blue Line. Specific comments are as follows: **MPT 04**

1. A principal focus of the traffic analysis should be the capacity and operation of the Route 1A corridor. The intersection at Boardman St. operates at a poor level of service; the bottleneck at this location can result in traffic queues that extend far enough south to affect access to Logan Airport. The proposed flyover should improve the situation; we would request that the EIR include thorough documentation (level of service estimates, network analysis using VISSIM or a similar tool) that will allow Massport to understand the effects of this proposed improvement. When evaluating off-site signalized intersection improvements, the proponent should consider the use of adaptive signal control technology (ASCT). Adaptive signal control is effective under non-traditional traffic conditions where there may be unpredictable traffic flow/fluctuations or unusual off-peak traffic patterns that would require a number of signal timing plans. **MPT 05** **MPT 06**

2. The preliminary plans show three access/egress locations. Please describe the expected split of traffic use for the three locations and document why this information supports the proposal for a northbound-only Route 1A flyover. **MPT 07**

3. The Commonwealth and Massport have made a large investment in the Ted Williams Tunnel /I-90 West Bound. It is important to preserve the ability of this facility to serve Massport's airport, maritime, and real estate assets. Traffic is often heavy Thursday and Friday evenings, resulting in delays that affect access to Logan Airport. We understand that more than half of the anticipated gaming activity will be on Friday, Saturday, and Sunday. The EIR should analyze the extent to which the casino's Friday and Sunday peaks may overlap with peak travel to Logan Airport. Since physical improvements to I-90 are unlikely to be feasible, the EIR should identify operational and demand management strategies that will serve to maintain reasonable levels of regional access to Massport properties. **MPT 08**

4. Trip generation: The ENF states that the Project will generate trips to/from the site over a 24-hour period, 7 days a week. Since the trip generation of an urban casino/resort is unique, the DEIR should thoroughly document the trip generation estimates (as possible without getting into proprietary or market-sensitive information). The intent here is to better understand the expected activity levels (trips) on an aggregate level and their time-of-day/day-of-week distribution. **MPT 09**

5. While most casino patrons are expected to arrive by private vehicle, employees are expected to use public transportation. In order for this to be fully realized, it is likely that both physical and operational improvements will be necessary. Issues such as safety, accessibility, and comfort (e.g., weather protection) influence the desirability and use of public transportation. Although the site is served on the periphery by MBTA rapid transit and bus services, the proposed development itself is not directly served. Thus, the proponent should identify the design elements on the property the will affect travel between the proposed development and the existing MBTA Blue Line Suffolk Downs Station. The EIR should address the operating and physical capacity of the MBTA Blue Line, including the following stations: Airport, Suffolk Downs, and Beachmont, Revere. The study should identify station impacts and potential physical improvements. Moreover, since the casino will operate 24 hours/day with three work shifts, the operating hours of the Blue Line should be acknowledged. The ENF notes that employees may travel to the site by high-occupancy shuttle service. The EIR should provide details, such as routes, frequency, capacity and location of parking facilities. There may be an opportunity to coordinate Massport-sponsored services (e.g., Sunrise Shuttle, shuttle buses serving the employee garage in Chelsea) with the casino. **MPT 10** **MPT 11**

6. Transportation Demand Management: The ENF states the proponent's commitment to an extensive Transportation Demand Management (TDM) program. The EIR should detail the specific plans that the proponent has with regard to both employee and patron TDM programs. Specific areas to address include: **MPT 12**

    a. Incentives for transit usage for both employees and patrons including subsidized transit passes or rides;
    b. Disincentives for driving including market rate paid parking for both employees and patrons;
    c. Marketing and information campaigns to promote access via alternative modes and high occupancy vehicles;

d. Expectations for employee commute patterns and plans for commuting during hours when the MBTA does not operate;
e. Off-site employee parking strategies;
f. Collaboration opportunities for employee transportation (as stated above, there are likely collaboration opportunities with Massport); and
g. Starting or joining a Transportation Management Association (TMA) for the East Boston Area (there may be opportunities to collaborate with the Logan Airport Employee TMA). Not only should a TDM program be specified, but the Project should identify a continuing source of funds to support on-going operations of recommended services and programs.

7. In the past, Suffolk Downs worked collaboratively with Massport to support our emergency airport parking needs; how would the proposed development program affect this? **MPT 13**

8. Will the transportation improvements meet the needs of an emergency evacuation from the East Boston/Revere area? **MPT 14**

9. Taxi Cab Demand. The Logan Airport taxi pool is served by Boston taxis and experiences 6,000 taxi dispatches on an average day and nearly double that rate on peak days. During peak travel periods, the supply of taxis is inadequate. Describe how the taxi demand at the Caesars's resort will be met without adversely affecting Logan customer service. **MPT 15**

10. Parking Demand – Logan parking lots are full approximately 40 days/year. Will the casino customers use Logan Parking specifically if there is an airport shuttle to the resort? **MPT 16**

11. Private/Corporate Aircraft Access - Please describe the percentage of customers that you expect to arrive at Logan in private aircraft? **MPT 17**

Building Heights. The proposed development is located approximately 5,500 feet north of Runway 22R and falls under the Runway 22R/4L Arrival and Departure Surfaces. Based on the preliminary site plan, the two hotels within the Casino Complex are 135 feet tall (Hotel I) and 166 feet tall (Hotel II). Hotel I is approximately 1,400 feet and Hotel II is approximately 1,000 feet from the centerline of Runway 4L/22R. Hotel II is also at the edge of the Runway 4L One Engine Inoperative (OEI) splay as defined by the International Civil Aviation Organization (ICAO).

As such, these concept building heights are at or close to several FAA and ICAO surfaces. Consequently, it will be important for the developer to work closely with Massport to evaluate potential aviation effects of these designs. Massport has previously provided the development team with a copy of the Logan Airspace Map (Version 2.0 dated December 2011) as a guide to help planning the casino development. The Logan Airspace Map defines the critical airspace around Boston Logan International Airport needed to protect arrival and departure flight corridors. **MPT 18**

As with any project close to Logan, as planning proceeds, the Casino proponent must file FAA Form 7460 and indicate the location of the highest points of each of the structure within the Casino Complex so that FAA can determine whether or not the development presents a hazard to air navigation. We recommend early coordination with FAA. **MPT 19**

Lighting and Solar Glare. Structures with extensive exterior lighting, glass facades, significant solar panel arrays or other architectural features have the potential to be a hazard to safe air navigation. The Draft EIR should detail any decorative exterior lighting, moving light displays or lasers and demonstrate that they will not have an impact on aviation. The EIR must carefully assess these issues and present all measures intended to avoid such impacts. **MPT 20**

Wildlife Hazard. We understand that Suffolk Downs is planning a significant composting facility to serve the existing race track. Due to the site's proximity to Logan Airport, the EIR must demonstrate compliance with FAA Wildlife Hazard Advisory Circular AC No. 150/5200, and in particular plans to avoid bird attractants. **MPT 21**

Energy and Site Utilities – Expected load growth and retirement of the Salem Harbor Station, demonstrate a need for additional resources or transmission system upgrades to ensure area electrical infrastructure reliability. (Greater Boston Area Transmission Needs Assessment, July 8, 2010). Pursuant to subsequent system planning developments, new electrical transmission upgrades have been identified. ISO-NE anticipates a four to seven year process for siting to development of new transmission services. Please clarify the electric transmission infrastructure improvements required to maintain system reliability and demonstrate coordination of the proposed casino development schedule with necessary infrastructure improvements required to maintain electric reliability in East Boston. **MPT 22**

Although the ENF states that "spare electric supply" shall be made available, it has been demonstrated through a Transmission Needs Assessment that electric supply capacity in this region requires infrastructure upgrades to maintain reliability – this project must demonstrate spare capacity statements made in the section relating to electric supply. It must be demonstrated that adjacent neighborhood electric supply is not affected by this development versus the statement "supply should not be affected". **MPT 23**

The Draft EIR must also demonstrate that the capacity of the existing water, sewer and stormwater infrastructure is capable of accommodating the substantial proposed new load. Maintenance of pressure on the water supply lines for purposes of both water supply and fire suppression should be confirmed in any proposed installation of either one (1) or two (2) proposed new pumping stations. Evaluation of the use of substantial on-site storage tanks may be required to maintain required system pressure. Proposed system design should be reviewed by MWRA, BWSC and Massport to coordinate current pumping operations for continued support of system pressure. **MPT 24**

Labor Market/Jobs Creation. With 2,500 construction jobs and an estimated 4,000 permanent new jobs, the casino resort expects to have significant positive regional economic impact. In order for the project to have those benefits without adversely affecting existing businesses including Logan Airport, the proponent should outline a strategy for the introduction of these new jobs, training and close coordination with the airport employers. **MPT 25**

Construction Phasing. The construction impact assessment should consider overlaps and potential conflicts with ongoing facility and infrastructure projects at Logan in terms of construction traffic, labor supply and construction materials. **MPT 26**

Thank you again for the opportunity to provide comments and input to the Draft EIR Scope. We would be pleased to answer and questions you might have on these comments and look forward to working with the Sterling Suffolk Racecourse, LLC project team and MassDOT as project planning and analysis proceeds. We look forward to providing similar comments on any other casino proposals in the Boston geographic area.

Sincerely,

Massachusetts Port Authority

James Doolin
Chief Development Officer

cc: MassDOT/Highway and Aeronautics (Attn: Christopher Willenborg,
David Mohler, Lionel Lucien)
Sterling Suffolk Racecourse, LLC (Attn: Chip Tuttle)
City of Boston (Attn: Elizabeth Dello Russo, Esq.)

MASSPORT

MPT 01 **The DEIR should carefully define the casino resort's customer base. This information will be critical to understanding the market area for the facility and likely access/egress patterns and modes of transportation. It will be important that the planning for the casino be informed by Massport's recent long-range forecasts on air passenger activity through 2030.**

Section 5.4 presents the derivation of the Resort's patron trip distribution based largely on Caesars' gravity model of its projected customer base that reflects Massport's long-range forecasts.

MPT 02 **The DEIR should also discuss any potential expansion plans for the 161-acre site; will the proposed site plan be constructed in phases and are there future expansion plans?**

There are no specific expansion plans contemplated at this time. Over the course of the license period, should the Proponent seek to expand the Project, it will return to MEPA and the Massachusetts Gaming Commission as necessary for approval of any expansion plans.

MPT 03 **The DEIR should also discuss any current or future plans the resort may have for a helipad.**

The Proponent has no future or long-range plans for a helipad, since the proximity of Logan International Airport will adequately serve the Project needs.

MPT 04 **The scope of the transportation analysis should be regional in nature and reflect the catchment area for patrons and employees. The geographic scope should be based on the Caesars marketing study and gravity model, both of which should be documented in the EIR... We believe that the Route 1A-Ted Williams Tunnel corridor deserves careful attention, as does the capacity and operation of the MBTA Rapid Transit Blue Line.**

The DEIR/EPNF roadway transportation study area is defined in Section 5.2.6. Analysis of the MBTA Rapid Transit Blue Line is presented in Sections 5.2.1 and 5.8.1 for existing and Build conditions, respectively.

MPT 05 **A principal focus of the traffic analysis should be the capacity and operation of the Route 1A corridor. The intersection at Boardman Street operates at a poor LOS; the bottleneck at this location can result in traffic queues that extend far enough south to affect access to Logan Airport. The proposed flyover should improve the situation; we would request that the EIR include thorough documentation... that will allow Massport to understand the effects of this proposed improvement.**

The DEIR/EPNF analysis is anchored on the flyover concept presented in the ENF, and a detailed traffic operations analysis is presented in Section 5.7.1. In addition, as requested by MassDOT, an alternatives analysis for the Route 1A infrastructure improvements is presented in Section 5.5.

MPT 06 **When evaluating off-site signalized intersection improvements, the Proponent should consider the use of adaptive signal control technology (ASCT). Adaptive signal control is effective under non-traditional traffic conditions where there may be unpredictable traffic flow/fluctuations or unusual off-peak traffic patterns that would require a number of signal timing plans.**

The use of ASCT will be considered during the design development of the concept plans for off-site signalized intersection improvements in coordination with MassDOT, DCR, BTD, and the City of Revere.

MPT 07 **The preliminary plans show three access/egress locations. Please describe the expected split of traffic use for the three locations and document why this information supports the proposal for a northbound-only Route 1A flyover.**

The distribution and assignment of Resort patron and employee trips is described and presented graphically in Sections 5.4.7 and 5.4.8.

MPT 08 **The Commonwealth and Massport have made a large investment in the Ted Williams Tunnel/I-90 Westbound. It is important to preserve the ability of this facility to serve Massport's airport, maritime, and real estate assets... The EIR should analyze the extent to which the casino's Friday and Sunday peaks may overlap with peak travel to Logan Airport... The EIR should identify operational and demand management strategies that will serve to maintain reasonable levels of regional access to Massport properties.**

The issues related to I-90/Ted Williams Tunnel are discussed in Section 5.7.5. Although complete data are not available to facilitate an operational analysis at this stage, the Proponent is committed to working with MassDOT to secure appropriate data and identify potential operational and management strategies.

MPT 09 **Since the trip generation of an urban casino/resort is unique, the DEIR should thoroughly document the trip generation estimates (as possible without getting into proprietary or market-sensitive information). The intent here is to better understand the expected activity levels (trips) on an aggregate level and their time-of-day/day-of-week distribution.**

The trip generation analysis in Section 5.4 is based on extensive research of proprietary data, other studies, and actual counts performed by the Proponent at comparable locations, combined with information specific to the Project site location to inform travel parameters such as mode share. Time-of-day and day-of-week distributions are described and presented.

MPT 10 **Although the site is served on the periphery by MBTA rapid transit and bus services, the proposed development itself is not directly served. Thus, the Proponent should identify the design elements on the property that will affect travel between the proposed development and the existing MBTA Blue Line Suffolk Downs Station. The EIR should address the operating and physical capacity of the MBTA Blue Line, including the following stations: Airport, Suffolk Downs, and Beachmont, Revere. The study should identify station impacts and potential physical improvements.**

An enhanced shuttle connection between Suffolk Downs Station and the Resort entrances is proposed, as noted in Section 5.0 and described in Sections 1.0 and 4.0. Sections 5.2.1 and 5.8.1 present a Blue Line operational analysis and station loadings under existing and Build conditions, respectfully.

MPT 11 **Since the casino will operate 24 hours/day with three work shifts, the operating hours of the Blue Line should be acknowledged. The ENF notes that employees may travel to the site by high-occupancy shuttle service. The EIR should provide details, such as routes, frequency, capacity and location of parking facilities. There may be an opportunity to coordinate Massport-sponsored services (e.g., Sunrise Shuttle, shuttle buses serving the employee garage in Chelsea) with the casino.**

As described in Section 5.4.2, the Project will not have three employee shifts; rather, there will be multiple shift changes throughout the day. The shuttle plan described in Section 5.8.3.2 will be the primary approach to addressing the gap in overnight transit service. As part of that plan, the Proponent is committed to collaborating with other transportation providers including Massport, the MBTA, and private entities in the region.

MPT 12 **The EIR should detail the specific plans that the Proponent has with regard to both employee and patron TDM programs, [including]:**

- **Incentives for transit usage for both employees and patrons including subsidized transit passes or rides;**
- **Disincentives for driving including market rate pair parking for both employees and patrons;**
- **Marketing and information campaigns to promote access via alternative modes and high occupancy vehicles;**

- Expectations for employee commute patterns and plans for commuting during hours when the MBTA does not operate;
- Off-site employee parking strategies;
- Collaboration opportunities for employee transportation (as stated above, there are likely collaboration opportunities with Massport); and
- Starting or joining a TMA for the East Boston Area (there may be opportunities to collaborate with the Logan Airport Employee TMA). Not only should a TDM program be specified, but the Project should identify a continuing source of funds to support ongoing operations of recommended services and programs.

A comprehensive TDM Plan is presented in Section 5.9.

MPT 13 **In the past, Suffolk Downs worked collaboratively with Massport to support our emergency airport parking needs; how would the proposed development program affect this?**

The Proponent will continue to work closely with Massport on coordination issues affecting airport parking needs.

MPT 14 **Will the transportation improvements meet the needs of an emergency evacuation from the East Boston/Revere area?**

By relieving existing regional traffic congestion in the Route 1A corridor well beyond the impact of the Project, the proposed infrastructure improvements will contribute positively to emergency evacuation plans.

MPT 15 **The Logan Airport taxi pool is served by Boston taxis and experiences 6,000 taxi dispatches on an average day and nearly double that rate on peak days. During peak travel periods, the supply of taxis is inadequate. Describe how the taxi demand at the Caesars Resort will be met without adversely affecting Logan customer service.**

The Proponent plans to work collaboratively with Massport and the City of Boston to efficiently coordinate taxi availability at the Resort and the airport. The Proponent's ground shuttle program is designed, in the first instance to reduce the use of taxis at the Resort to the maximum extent possible. The Proponent also expects to take full advantage of the proliferation of alternatives to taxi cabs such as ridesharing and other on demand car services that are now available. To the extent that a good number of taxis will continue to travel to the Resort, as expected, the Proponent's TDM strategy includes a transportation coordinator who will be on-site twenty-four hours a day, seven days a week and whose tasks will include, among other things, monitoring taxi requirements and taxi cab flow. In all cases, the

Proponent is prepared to work collaboratively with Massport and the cities of Boston and Revere to efficiently coordinate taxi availability at the Resort and the airport.

MPT 16 **Logan parking lots are full approximately 40 days/year. Will the casino customers use Logan Parking specifically if there is an airport shuttle to the resort?**

A shuttle between Logan International Airport and the Resort is planned, but Resort patrons are not expected to park at Logan lots since there will be adequate parking for patrons on-site. The parking analysis is presented in Section 5.10.

MPT 17 **Please describe the percentage of customers that you expect to arrive at Logan in private aircraft?**

Less than 1% of customers are expected to arrive by private aircraft.

MPT 18 **[Hotel I at 135 feet tall and Hotel II at 166 feet tall] are at or close to several FAA and International Civil Aviation Organization (ICAO) surfaces. Consequently, it will be important for the developer to work closely with Massport to evaluate potential aviation effects of these designs.**

The Proponent is working closely with Massport and MassDOT's Aeronautics Division to evaluate the Resort's potential effects on aviation, including those associated with the heights of Hotel I and Hotel II.

MPT 19 **As with any project close to Logan, as planning proceeds, the Proponent must file FAA Form 7460 and indicate the location of the highest points of each of the structures within the Casino Complex so that FAA can determine whether or not the development presents a hazard to air navigation. We recommend early coordination with FAA.**

The Proponent intends to file any required notices prior to construction and to engage with the FAA early in the process.

MPT 20 **The DEIR should detail any decorative exterior lighting, moving light displays or lasers and demonstrate that they will not have an impact on aviation. The EIR must carefully assess these issues and present all measures intended to avoid such impacts.**

The Project design is evolving, and the Proponent will be studying all site lighting and signage in the next phase of design to eliminate any aviation impacts. The Proponent continues to work closely with Massport to ensure there are no Project-related impacts.

MPT 21 **We understand that Suffolk Downs is planning a significant composting facility to serve the existing racetrack. Due to the site's proximity to Logan Airport, the EIR must demonstrate compliance with FAA Wildlife Hazard Advisory Circular AC No. 150/5200-33C, and in particular plans to avoid bird attractants.**

In compliance with the FAA Wildlife Hazard Advisory Circular AC No. 150/5200-33C, there will not be any composting on site, any on-site dumpsters will be covered, and there are no new open water stormwater management facilities planned.

MPT 22 **Please clarify the electric transmission infrastructure improvements required to maintain system reliability and demonstrate coordination of the proposed casino development schedule with necessary infrastructure improvements required to maintain electric reliability in East Boston.**

The building will be powered from an existing utility substation which the utility company has indicated has the capacity to support the Resort without impacting the reliability of service to the rest of East Boston.

MPT 23 **Although the ENF states that "spare electric supply" shall be made available, it has been demonstrated through a Transmission Needs Assessment that electric supply capacity in this region requires infrastructure upgrades to maintain reliability – this Project must demonstrate spare capacity statements made in the section relating to electric supply. It must be demonstrated that adjacent neighborhood electric supply is not affected by this development versus the statement "supply should not be affected."**

Please see the response to MPT 22.

MPT 24 **The DEIR must also demonstrate that the capacity of the existing water, sewer and stormwater infrastructure is capable of accommodating the substantial proposed new load. Maintenance of pressure on the water supply lines for purposes of both water supply and fire suppression should be confirmed in any proposed installation of either one or two proposed new pumping stations. Evaluation of the use of substantial on-site storage tanks may be required to maintain required system pressure. Proposed system design should be reviewed by MWRA, BWSC and Massport to coordinate current pumping operations for continued support of system pressure.**

The Proponent will continue to coordinate with BWSC and the MWRA to ensure that adequate capacity exists in the water and sewer system. Previous pressure testing indicated that adequate water pressure exists to service the site. All treated

stormwater will be discharged on-site towards existing wetlands and will not discharge to BWSC stormwater lines. Three large rainwater reuse tanks will be installed to reduce stormwater runoff and reduce potable water demand.

MPT 25 **With 2,500 construction jobs and an estimated 4,000 permanent new jobs, the casino resort expects to have significant positive regional economic impact. In order for the Project to have those benefits without adversely affecting existing businesses including Logan Airport, the Proponent should outline a strategy for the introduction of these new jobs, training and close coordination with the airport employers.**

The Proponent is aware of the existing employment base and will seek to create employment opportunities for underserved and underemployed populations through the programs described in Section 1.10. Unemployment rates in nearby communities, which approach 8% in certain cases, suggest there are available employees in the area. It should also be noted that some employees may work part-time at both locations.

MPT 26 **The construction impact assessment should consider overlaps and potential conflicts with ongoing facility and infrastructure projects at Logan in terms of construction traffic, labor supply and construction materials.**

The contractor will consider these factors when developing the Project construction schedule.

Secretary Richard K. Sullivan, Jr.
Executive Office of Energy and Environmental Affairs
Attn: Deirdre Buckley, MEPA Office
100 Cambridge Street, Suite 900
Boston, Massachusetts 02114

Re: EOEEA #15006 Caesars Resort at Suffolk Downs ENF

Dear Secretary Sullivan:

The Department of Conservation and Recreation ("DCR" or "Department") is pleased to submit the following comments in response to the Environmental Notification Form ("ENF") submitted by Sterling Suffolk Racecourse LLC ("the Proponent") for the Caesars Resort at Suffolk Downs project (the "Project").

As described in the ENF, the Project proposes to redevelop approximately 161 acres of land to construct a destination resort in East Boston and Revere. The proposal includes two distinct gaming areas, up to 450 guestrooms in two hotels, a multi-purpose meeting/entertainment space, and restaurant and retail space. The ENF presents conceptual roadway improvements, including new ramp connections at the Route 1 / Route 16 interchange intended to reduce traffic volumes on nearby Route 60. A total of 5,150 parking spaces are proposed for the Project site, including approximately 2,600 spaces within a seven-story parking garage. Primary site access is proposed off Route 1A, with a secondary access road off Revere Beach Parkway at Tomesello Way. Bicycle accommodations are proposed along Bennington Street between Saratoga Street and Eliot Circle. The Project requires a full Environmental Impact Report ("EIR").

DCR has care and control of Revere Beach Parkway, including Eliot Circle located approximately ¼ mile north from the proposed development. In addition, DCR has care and control of Belle Isle Marsh Reservation in East Boston, located across Bennington Street from the Project site. DCR's Revere Beach Reservation is located approximately ½ mile to the north of the proposed Project. The ENF states the Project requires a DCR Construction and Access Permit.

DCR submits the following comments related to current vehicle capacity and impacts to Revere Beach Parkway.

Transportation

As part of the EIR, DCR requests that the Proponent prepare vehicle trips estimates to approximate the anticipated distribution of trips between the two proposed site entrances / exits (Route 1A and Revere Beach Parkway). DCR also requests specific information on the requested improvements to traffic signals or other infrastructure on Revere Beach Parkway at Tomesello Way. Additionally, DCR requests details on the proposed alteration to the traffic signal at Garfield Avenue/Webster Avenue/Revere Beach Parkway in Chelsea. **DCR 01** **DCR 02**

Department of Conservation and Recreation
251 Causeway Street, Suite 600
Boston MA 02114-2119
617-626-1250 617-626-1351 Fax
www.mass.gov/dcr

Deval L. Patrick
Governor

Timothy P. Murray
Lt. Governor

Richard K. Sullivan, Jr., Secretary
Executive Office of Environmental Affairs

Edward M. Lambert Jr., Commissioner
Department of Conservation & Recreation

DCR has received requests from the City of Revere to reduce the number of lanes on Revere Beach Parkway between Harris Road and North Shore Road from six lanes (three eastbound / three westbound) to four lanes (two eastbound / two westbound). As part of the EIR, DCR requests that the Proponent evaluate what impacts this change might have, given the anticipated level of traffic during peak periods. **DCR 03**

DCR notes that the existing horse racing activity at Suffolk Downs generates large amounts of traffic on certain Saturdays in May and June, coinciding with Triple Crown horse racing events. DCR's Revere Beach Reservation also generates a significant amount of traffic on these specific Saturdays when temperatures are relatively high. To understand the maximum potential traffic load on Revere Beach Parkway, DCR requests that the Proponent generate expected peak traffic estimates on Revere Beach Parkway between Eliot Circle and Route 16. **DCR 04**

As part of the Project, the Proponent plans to construct a rampway that would improve access between Route 1 and Revere Beach Parkway with the stated goal of addressing existing capacity issues on Route 60 in Revere. As part of the EIR, DCR requests the Proponent demonstrate the impact of the improvement on Revere Beach Parkway by estimating vehicle trips with and without the proposed improvement. This analysis should calculate the net difference of regional vehicle trips that will use Revere Beach Parkway with and without the improvement. Similarly, DCR requests the Proponent estimate the the anticipated increase of vehicle trips generated by the Project. This information will help DCR assess the anticipated net increase of traffic on Revere Beach Parkway resulting from the proposed rampway. **DCR 05**

DCR notes that two bridges along Revere Beach Parkway are scheduled for reconstruction / repair under the Accelerated Bridge Project: one located over the MBTA Blue Line between the Beachmont and Revere Beach stations; the other located over the MBTA Newburyport / Rockport commuter rail line at Winthrop Avenue. DCR requests that in the EIR the Proponent specify whether work on these bridges and any resultant reduced capacity may impact Project construction. **DCR 06**

DCR requests that the EIR include information on how tour buses will access the proposed site, and the anticipated volume of tour buses that can be expected. **DCR 07**

Revere Beach Reservation

DCR notes that the southern extent of Revere Beach Reservation is a half-mile from the Project site, and is two stops away on the MBTA Blue Line. In the EIR, DCR requests that the Proponent include an analysis to anticipated impacts to area open space and recreation facilities, including DCR's Revere Beach Reservation and Belle Isle Reservation. **DCR 08**

Thank you for this opportunity to comment. If you have questions or need further information on DCR parkways, please contact Ken Kirwin at 617-626-1498 or ken.kirwin@state.ma.us.

Sincerely,

Edward M. Lambert, Jr.
Commissioner

cc: Andy Backman, Chris Delaney, Ray Faucher, Susan Hamilton, Dan Hunt, Brian Kelly, Ken Kirwin, Mike Misslin, Joe Orfant, Nathaniel Tipton (DCR)
Paul Tuttle, Sterling Suffolk Racehorse LLC
Elizabeth Grob, Epsilon Associates

DCR 01 **As part of the EIR, DCR requests that the Proponent prepare vehicle trips estimates to approximate the anticipated distribution of trips between the two proposed site entrances/exits (Route 1A and Revere Beach Parkway).**

Projected Project vehicle trips and their distribution and assignment to the Route 1A and Revere Beach Parkway site driveways are presented in Section 5.4.

DCR 02 **DCR also requests specific information on the requested improvements to traffic signals and other infrastructure on Revere Beach Parkway at Tomasello Way. Additionally, DCR requests details on the proposed alteration to the traffic signal at Garfield Avenue/Webster Avenue/Revere Beach Parkway in Chelsea.**

Proposed improvements on Revere Beach Parkway are presented in Section 5.6, and traffic signal operational analysis is presented in Section 5.7.

DCR 03 **DCR has received requests from the City of Revere to reduce the number of lanes on Revere Beach Parkway between Harris Road and North Shore Road from six lanes (three eastbound/three westbound) to four lanes (two eastbound/two westbound). As part of this EIR, DCR requests that the Proponent evaluate what impacts this change might have, given the anticipated level of traffic during peak periods.**

The Proponent has made commitments for traffic, safety, and roadway improvements in the HCAs with the cities of Boston and Revere. The specific improvements referenced have not been requested by the City of Revere, and are not included in the Revere HCA.

DCR 04 **DCR notes that the existing horse racing activity at Suffolk Downs generates large amounts of traffic on certain Saturdays in May and June, coinciding with Triple Crown horse racing events. DCR's Revere Beach reservation also generates a significant amount of traffic on these specific Saturdays when temperatures are relatively high. To understand the maximum potential traffic load on Revere Beach Parkway, DCR requests that the Proponent generate expected peak traffic estimates on Revere Beach Parkway between Eliot Circle and Route 16.**

The transportation study area and analysis in Sections 5.2.6 and 5.7 includes Revere Beach Parkway between Eliot Circle and Route 16. Peak hour traffic projections for this corridor are presented in Section 5.4.8.

DCR 05 **As part of the Project, the Proponent plans to construct a rampway that would improve access between Route 1 and Revere Beach Parkway with the stated goal of addressing existing capacity issues on Route 60 in Revere. As part of the EIR, DCR**

requests the Proponent demonstrate the impact of the improvement on Revere Beach Parkway by estimating vehicle trips with and without the proposed improvement. This analysis should calculate the net difference of regional vehicle trips that will use Revere Beach Parkway with and without the improvement. Similarly, DCR requests the Proponent estimate the anticipated increase of vehicle trips generated by the Project. This information will help DCR assess the anticipated net increase of traffic on Revere Beach Parkway resulting from the proposed rampway.

Analysis of the proposed ramp connections at Route 1 and Route 16 is presented in Section 5.7.4.

DCR 06 DCR notes that two bridges along Revere Beach Parkway are scheduled for reconstruction/repair under the Accelerated Bridge Project: one located over the MBTA Blue Line between the Beachmont and Revere Beach stations; the other located over the MBTA Newburyport/Rockport commuter rail line at Winthrop Avenue. DCR requests that in the EIR the Proponent specify whether work on these bridges and any resultant reduced capacity may impact Project construction.

It is not anticipated that the bridge reconstruction/repairs will impact Project construction. However, the Proponent will coordinate closely with MassDOT and DCR in further developing the Project construction schedule.

DCR 07 DCR requests that the EIR include information on how tour buses will access the proposed site, and the anticipated volume of tour buses that can be expected.

Tour buses will access the site via the Tomasello Drive entrance on Route 1A. It is expected that approximately 10 tour buses will visit the Resort on the busiest days (Saturday).

DCR 08 In the EIR, DCR requests that the Proponent include an analysis of anticipated impacts to area open space and recreation facilities, including DCR's Revere Beach Reservation and Belle Isle Reservation.

The Proponent will continue to coordinate with DCR regarding DCR open space and recreational facilities to ensure that any potential impacts are minimized, and is promoting bicycle access to the beaches.

Re: EEA# 15006

Dear Secretary Sullivan:

The Division of Marine Fisheries (*MarineFisheries*) has reviewed the Environmental Notification Form submitted by Sterling Suffolk Racecourse, LLC. The proposal is to construct a casino resort redevelopment located at Suffolk Downs in East Boston and Revere, MA.

The project is located on filled tidelands between Belle Isle Inlet and Chelsea River. A portion of the Rumney Marshes ACEC (Area of Critical Environmental Concern) extends into the Suffolk Downs site along Sales Creek. Belle Isle Inlet contains soft shell clam (*Mya arenaria*) and blue mussel (*Mytilus edulis*) resource and is within the GBH5.12 shellfish growing area, which is currently prohibited for shellfish harvest. This area is potential habitat for winter flounder (*Pseudopleuronectes americanus)* spawning and juvenile development. The creek is utilized for forage and shelter by juvenile striped bass (*Morone saxatilis*) and tomcod (*Microgadus tomcod)* and is a migratory pathway for rainbow smelt (*Osmerus mordax*) and American eel (*Anguilla rostrata*).

The project would result in the reduction of impervious surface and improvement to the stormwater management systems, compared to existing conditions. The application indicates that a mix of LID and conventional stormwater management techniques will be used to provide water quality treatment. *MarineFisheries* recommends that the proponent make every effort to treat stormwater using the best available stormwater management techniques, specifically designed to treat the pollutants and sediments at the site. Biofiltration swales, green roofs and rain gardens, should be explored as possible ways to improve infiltration and flood control as well as filtration and pollution attenuation. Finally, the project site surrounds Sales Creek and the ACEC. Therefore, we recommend that the applicant explore ways to improve the ecological function of Belle Isle Marsh and Sales Creek, such as improvements to the tidal restriction at Bennigton Street, to allow tidal inundation into the wetlands on the project site. **DMF 01**

Thank you for considering our comments. Please contact Tay Evans of my staff at 978-282-0308 x. 168 if you have any questions about our review.

Sincerely,

Paul J. Diodati

cc
Tay Evans, DMF
Kate Ostrikis, DMF

PD/te/ko

MASSACHUSETTS DIVISION OF MARINE FISHERIES

DMF 01 **Marine Fisheries recommends that the Proponent make every effort to treat stormwater using the best available stormwater management techniques, specifically designed to treat the pollutants and sediments at the site. Biofiltration swales, green roofs, and rain gardens should be explored as possible ways to improve infiltration and flood control as well as filtration and pollution attenuation.**

The Project will meet and exceed the MassDEP Stormwater Management Guidelines. LID BMPs will be installed throughout the site, including water quality swales, biofiltration swales, bioretention basins, pervious pavers in pedestrian areas, and rainwater harvesting tanks will provide enhanced water quality treatment and reduce the volume of stormwater leaving the site (see Section 9.3).

DMF 02 **We recommend that the applicant explore ways to improve the ecological function of Belle Isle Marsh and Sales Creek, such as improvements to the tidal restriction at Bennington Street, to allow tidal inundation into the wetlands on the Project site.**

The Project will help restore the ecological functions of Belle Isle Marsh and Sales Creek by improving the quality and quantity of discharges from the Project site. The Project does not include any proposed changes to the tide gates at Bennington Street.

March 26, 2013

Richard K. Sullivan, Jr., Secretary
Executive Office of Energy & Environmental Affairs

Deirdre Buckley, MEPA #15006
100 Cambridge Street, Suite 900
Boston, MA 02114

RE: Caesars Resort at Suffolk Downs, MEPA #15006

Dear Secretary Sullivan:

The Metropolitan Area Planning Council (MAPC) regularly reviews proposals deemed to have regional impacts. The Council reviews proposed projects for consistency with *MetroFuture*, the regional policy plan for the Boston metropolitan area, the Commonwealth's Sustainable Development Principles, the GreenDOT initiative, Boston's Complete Streets Initiative, as well as impacts on the environment.

Sterling Suffolk Racecourse, LLC (the Proponent) is the owner of a 161-acre parcel of land located in the cities of Boston and Revere, where it operates Suffolk Downs, a thoroughbred horse racing facility. In addition to retaining horse racing, the Proponent proposes to construct a destination resort casino, Caesars Resort at Suffolk Downs (the Project). Specifically, the Project will contain two distinct gaming areas comprising 200,000 square feet of gaming space and up to 450 guestrooms in two hotels. The gaming space is proposed to contain 4,000-5,000 slot machines, 200 table games, and a World Series of Poker™ room. The Project will also contain multi-purpose meeting/entertainment, dining, and retail space. In sum, an estimated 1.47 million square feet of new development will be added to .33 million square feet of existing development that will be renovated.

The Project site is surrounded by Route 1A to the west, Route 145 (Revere Beach Parkway/Winthrop Avenue) to the north, Bennington Street to the east, and Waldemar Avenue to the south. The Project is accessible from the Suffolk Downs station stop on the Blue Line and is a mile away from Logan Airport.

A total of 5,150 parking spaces are proposed for the Project. Of these spaces, approximately 3,050 will be in a seven-story parking garage (450 spaces will be for valet parking). In addition to the garage, 2,100 surface parking spaces are proposed. The Project is forecast to add 24,600 vehicular trips on an average weekday, increasing the total number of trips to 40,500 onto the area street network.

The Proponent plans to file an application with the Massachusetts Gaming Commission seeking a license to operate a Category I gaming establishment at Suffolk Downs. In addition, a Highway Division Category III Access Permit from MassDOT and an Access Permit from the Department of Conservation and Recreation will be required for this Project.

MAPC has reviewed the Environmental Notification Form (ENF) and has concerns which focus on regional traffic impacts, mode share goals, storm water and water quality, flooding, and wetlands impacts which are all detailed as an attachment to this letter. MAPC respectfully requests that the Secretary incorporate our recommendations and questions into the scope for the Draft Environmental Impact Report (DEIR).

MAPC has a long term-interest in alleviating regional traffic and environmental impacts, consistent with the goals of *MetroFuture*. The Commonwealth also has established a mode shift goal of tripling the share of travel in Massachusetts by bicycling, transit and walking, as well as a statutory obligation to reduce greenhouse gas emissions (GHG) by a 25 percent reduction from 1990 levels by 2020 and an 80 percent reduction from 1990 levels by 2050. This Project, and any Category I gaming establishment, is likely to make all these goals more difficult to achieve. Therefore, the Secretary faces a special obligation to require all actions that will minimize or mitigate the substantial adverse impacts of such projects and keep the Commonwealth on track in meeting its regulatory and statutory goals.

I have also attached MAPC's Policy Statement, 'Locating a Casino: Much at Stake for Host Community and Region', for your information.

Thank you for the opportunity to comment on this project.

Sincerely,

Marc D. Draisen
Executive Director

Metropolitan Area Planning Council (MAPC) comments on Casino Resort at Suffolk Downs ENF, MEPA #15006

Regional Trip Distribution and Traffic Analysis

Casinos are significant and unique traffic generators. Unlike most other uses, casinos generate traffic 24 hours a day, 7 days a week, 365 days a year. More than half of weekly gaming activity for this Project is expected to occur on Friday, Saturday and Sunday combined. MAPC looks forward to reviewing the following components in the DEIR that address the distinctive factors related to this Project:

Regional Trip Distribution

Vehicle trips to and from casinos are usually much longer compared to other types of trips such as driving from home to work or home to shopping. It is important to understand the geographic distribution of patrons and employees for this regional destination. Where will these trips originate and what highways will drivers utilize (e.g., I-90, I-93, Route 1, Route 1A, Route 16)? In addition to the local traffic analysis required in a typical MEPA analysis, this DEIR should address the regional impacts of Project-related traffic. **MAPC 01**

Traffic Projections

While the ENF states the DEIR will include a No-Build traffic analysis based on the projection of traffic volumes for a "horizon" year of 2020, the projections are for the year 2017. At a minimum, the analysis of the traffic impacts should be for ten years (as was done for the Project First Light Destination Resort Casino's ENF in Taunton). **MAPC 02**

Peak Period Traffic Analysis

The peak Project generated traffic is expected to occur after the evening peak commuter period during the week and after the afternoon peak on Saturdays. The ENF states that, accordingly, peak hours for traffic associated with the proposed Project are not expected to coincide with commuter peaks. The DEIR needs to explain the peak periods related to this project as well as analyze the potential for overlap between commuter peak periods and casino peak periods, with particular focus on Fridays. **MAPC 03**

Crash Data Analysis

Casino traffic is more prone to accidents, such as drunk-driving incidents, than regular traffic. The Proponent needs to address the likelihood of an increase in accidents as part of its study of area crash data in the DEIR. The Proponent should take into account accidents involving patrons travelling to and from the Project by vehicle, bicycle and foot, even when those accidents occur relatively far from the site itself. The DEIR should include a clear explanation of steps the Proponent will take to minimize drunk driving and the accidents that occur as a result, especially in regard to patrons leaving the facility. **MAPC 04**

Mode Share Goals

According to the ENF, the majority of patrons are expected to travel by auto and the majority of employees are expected to travel by transit and shuttle service. The DEIR should outline a monitoring program to ensure that specifically defined mode share goals for both patrons and employees are accomplished. Along with specific steps to achieve these goals, the monitoring program should cover a defined period. Mode share goals should result in an increase for employee carpooling, public transportation, shuttles, charter buses, walking, and bicycling, and a decrease for single-occupancy vehicle (SOV) use. **MAPC 05**

Traffic and Roadway Infrastructure

Mitigation

In addition to the regional roadway network, the Proponent has indicated a commitment to assisting with local roadway and safety improvements and has already proposed a strong mitigation program that will improve capacity and vehicular circulation. It is imperative that the increased traffic flow be mitigated, for accessibility and safety concerns. The DEIR should build upon the mitigation described in the ENF and outline when it will be **MAPC 06**

implemented as well as how it will be monitored and enforced. The Proponent will need to continue to work with MassDOT, DCR, Boston, and Revere in addition to the surrounding communities to develop a comprehensive mitigation program. The scope and schedule of proposed mitigation should be clearly outlined as part of the MEPA process. Parties responsible for funding, implementation, and maintenance should be clearly defined as well.

Route 1A

Initial observations indicate that there is significant regional congestion in the Route 1A corridor, which continues north on Route 60 through Revere to Route 1. To that end, the Proponent proposes to construct substantial infrastructure improvements on Route 1A and in the vicinity of the Project site.

The ENF has indicated these improvements could include a Route 1A northbound flyover at Boardman Street, an additional Route 1A southbound lane, and the signalization of the Route 1A/Waldemar Avenue and Route 1A/Tomasello Drive intersections. The design of these improvements will need to be developed in consultation with MassDOT and area communities to address existing local and regional traffic challenges, improve safety, and provide capacity to accommodate Project trips entering and exiting the site. Providing adequate and efficient access/egress points to the Project site will enable the efficient flow of traffic thus potentially reducing adverse impacts to the local community, such as noise and air pollution. **MAPC 07**

Improvements to Route 1A will need to significantly improve safety and traffic capacity in the vicinity of the Project site, with reduced queuing and delays for both local and regional traffic as well as access to the site. Efficient travel along 1A will be challenging and the DEIR needs to address this in more detail. **MAPC 08**

Route 1/Route 16 Interchange

The cities of Revere and Chelsea have asked that existing regional traffic issues along the Route 60 and Route 1 corridors be studied to identify and assist in funding potential improvements. The Proponent has identified new ramp connections at the Route 1/Route 16 interchange and improvements along the Revere Beach Parkway corridor as potential mid-term improvements. These improvements are consistent with the *Boston Metropolitan Planning Organization's Lower North Shore Transportation Improvement Study* (prepared by the Central Transportation Planning Staff for the Massachusetts Highway Department in October 2000).

Proposed changes to Route 1 need to be consistent with MassDOT's proposal to widen and relocate a portion of Route 1 in Revere, Malden, and Saugus This 2.4-mile project begins 1,500 feet south of the Route 1/Route 60 interchange (Copeland Circle) and proceeds north through the Route 1/Route 99 Interchange. **MAPC 09**

Pedestrian and Bicycle Access

Local and Regional Connections

MAPC is pleased the ENF emphasizes strengthening pedestrian and bicycle connections to and within the site, specifically to the Suffolk Downs MBTA station, the Orient Heights neighborhood, and the retail stores located north of the site. MAPC looks forward to reviewing these details as well as how the proposed connections will integrate with other area projects in the DEIR. MAPC applauds the Proponent for proposing to expand the bicycle network which will allow for an almost continuous route between the East Boston waterfront and the front entrance to Belle Isle Marsh and Revere Beach.

Bicycle Parking

While the Proponent has mentioned providing bicycle storage racks near the front doors of the facilities, it is important that the Project have convenient, secure indoor bicycle parking for both patrons and employees. There should be additional consideration to allocating space for showers and changing rooms for the employees in the buildings. **MAPC 10**

Hubway

As part of its mitigation program, the Proponent should fund the expansion of Hubway stations at Suffolk Downs station and other locations in East Boston, Winthrop and Revere. The expansion of the Hubway system will promote increased bicycle use and enable the Proponent to reach its mode share goals. **MAPC 11**

Safety

The pedestrian and bicycle connections should be designed with safety in-mind, especially at night. MAPC looks forward to reviewing more details of a lighting program both in and around the Project. **MAPC 12**

Parking/Circulation

Surface Parking

The Project will create nine acres of additional pervious area and will redevelop an existing impervious parking lot. MAPC strongly encourages the Proponent to explore using innovative permeable paving technologies and other landscaping uses that facilitate drainage and stormwater management. **MAPC 13** It is important that surface parking spaces are well landscaped, pedestrian friendly, and have permeable surfaces. MAPC suggests that the Proponent consider implementing a program that will phase in surface parking spaces as demand warrants subsequent to the construction of the parking garage and full occupancy of the Project. **MAPC 14**

Employee Parking

The ENF mentions that while patron cars will be accommodated on site, it is anticipated that employee cars will be accommodated only during off-peak parking demand periods. Where will employees park during peak demand periods? It is important to keep parked cars associated with the Project out of the area neighborhoods. **MAPC 15**

Fees

The DEIR should explain whether there will be a fee for patrons to park in the garage or surface lots. MAPC strongly encourages the Proponent to consider incorporating a fee for funding the Transportation Demand Management (TDM) program, the Community Improvement Fund, or mitigation for environmental impacts. **MAPC 16**

Events

The Proponent has mentioned that events such as corporate gatherings and weddings will take place at the Project. The DEIR should address what will occur in the event of parking overflow. **MAPC 17**

Trucks

The DEIR should provide information regarding the estimated number, size, and frequency of trucks accessing the Project site. In particular, information regarding how will trucks will access the Project site and where they will originate should be provided (e.g., Will trucks be required to access designated roadways?, What routes will they take?, What is the schedule of regular truck visits?, and What steps can be taken to minimize noise disruption to surrounding neighborhoods?). **MAPC 18**

Transportation Demand Management (TDM) Program

MAPC applauds the Proponent for proposing an aggressive TDM program and looks forward to reviewing strategies to reduce SOV travel and encourage use of alternative transportation modes in the DEIR. While the Project site is well served by public transportation, public transit needs to be strongly promoted for employees and patrons. It is important that the TDM plan be tailored to the differing needs of patrons and employees. For example, due to the 24/7 operations of a casino, employees will be working in shifts. It is important that employee shift changes take place during times when the MBTA is operating. **MAPC 19**

MBTA Passes

In addition to joining the Logan Airport TMA, the Proponent should consider providing patrons with MBTA passes (Day/Week Link Pass) in addition to giving MBTA passes to employees (Monthly Link Pass) as incentives to use public transportation. **MAPC 20**

Shuttle Service Options

The Proponent should explore implementing the following shuttle service options:

Shuttle Service to and from Suffolk Downs Station

In addition to promoting public transportation, the Proponent should provide a high frequency shuttle bus that picks people up at the MBTA station and drops them off directly in front of the casino. The shuttle bus should offer frequent service on a continuous basis at no cost to passengers. **MAPC 21**

Area Shuttle Service

MAPC looks forward to reviewing a more detailed analysis in the DEIR that includes shuttle services that would: **MAPC 22**

- Provide access to and from Logan Airport, water transportation terminals, local area hotels, downtown Boston, the Boston Convention and Exhibition Center, and the Black Falcon Cruise Terminal.

- Connect with other regional entertainment and tourism venues.

Public Transportation

The DEIR should outline how the Proponent will coordinate with the MBTA, specifically regarding how connections between Suffolk Downs station and the Project can be enhanced. In addition, the Proponent should consider partnering with the MBTA by contributing to the operating costs of the Blue Line or area bus lines in an amount that is reasonably related to the Project's additional demand. **MAPC 23**

Water Transportation

The DEIR should describe any plans to coordinate with Massport regarding a potential water/bus shuttle system from downtown Boston to East Boston and the Project site or other water shuttle service connections. **MAPC 24**

Charter Buses

The DEIR needs to analyze the estimated number and peak periods of charter bus activity. While the ENF describes the designated area for charter bus pick-up/drop-off, it does not indicate where and for how long they will layover (e.g., How will the charter buses access the Project site and where will they be coming from?, Will the charter buses be required to access designated roadways?, and What steps will be undertaken to minimize idling?). **MAPC 25**

Signage

While the ENF does not mention any signage programs, the DEIR needs to describe the proposed regional and local signage program. MAPC strongly discourages the installation of digital video display signs or billboards as part of this Project. **MAPC 26**

Housing and Community Business Impacts

While the Project does not include a residential component, there are direct and indirect impacts that will result from the new development associated with the casino. The Project may spur new housing construction in the immediate as well as broader neighborhoods in Boston and Revere. This new development has an impact on the regional housing stock and should provide a range of housing types as well as be available to a broad range of incomes. Additionally, new housing should be located close to existing transit Blue Line and key bus routes in the area, particularly due to the nature of permanent jobs proposed for the Project. The Project will likely have a direct impact on existing housing prices and values. Both Cities should work through their respective Community Advisory Boards to ensure that the community benefits are provided to minimize or mitigate any negative housing and community business impacts, specifically ensuring that residents and local businesses are not displaced and new housing is in keeping with the provision of a range of housing types and available to a range of incomes.

Ancillary Development

Analysis of likely ancillary development activity and related impacts on land owned and not owned by the Proponent should be conducted to understand all potential impacts of the proposed Project. There should be particular attention to new housing, the impact on home values, the retail plaza abutting the Project site on Furlong Drive, and the 34-acre Wonderland Greyhound Park property owned by Suffolk Downs at Wonderland on the Blue Line. It should be noted that Saturday peak periods of retail and supermarket activity on Furlong Drive will most likely overlap with the Saturday peak periods of the proposed Project. **MAPC 27**

Water Quality

As stated in the ENF, the Suffolk Downs site includes one of the only Confined Animal Feeding Operations (CAFO) in Massachusetts. There have been Clean Water Act Violations in the past from the CAFO system. Although wastewater pollution and mitigation measures were briefly described in the ENF, stormwater management of the CAFO was not made apparent, which brings into question whether the site would require an individual National Pollutant Discharge Elimination System (NPDES) permit, as regulated under 33 U.S.C. 1251 § 122.21, or a Notice of Intent under Massachusetts NPDES General Permit, as required by § 122.21(i)(1). In addition, it is unclear whether a nutrient management plan is also required under § 122.42(e), as well as applicable effluent limitations and standards as specified in 40 CFR part 412. **MAPC 28**

Climate Change

Our general observations are that this redevelopment site presents a prime opportunity for the Cities of Boston and Revere to showcase innovative stormwater and green infrastructure techniques that account for climate change/sea level rise impacts. MAPC is currently developing a Regional Climate Change Adaptation Strategy that aims to prepare recommendations for local, regional, and state action to reduce vulnerability to future hazards and impacts of climate change. In addition, The Boston Harbor Association's *Preparing for the Rising Tide* report outlines vulnerabilities specific to Boston's coastline, including sites such as Suffolk Downs, and recommends how the private and public sectors can work together to address them. We are enthusiastic about the Proponent's willingness to maintain the site's natural hydrology, which will provide natural flood storage; however, we have some concerns regarding building, infrastructure, and landscape design statements, as discussed below.

<u>Building Design and Access</u>

Massachusetts' legislation enabling casinos includes guidelines that address community impact and design. It requires the Massachusetts Gaming Commission to issue regulations that include criteria such as "an evaluation of architectural design and concept excellence; integration of the establishment into its surroundings, [and] potential access to multi-modal means of transportation[1]." On December 12, 2012, the Boston Society of Architects and Massachusetts Gaming Commission co-hosted a forum, 'Promoting Sustainability and Strengthening Communities: Design Excellence for Massachusetts Casinos' on design considerations for casino facilities, with the goal of promoting sustainability and design excellence in harmony with local communities.

While MAPC is pleased the Proponent is striving for LEED Gold certification, the ENF does not include information regarding how the building design would meet LEED criteria, nor does it explain how the project will comply with the City of Boston's Article 37: Green Buildings, which is an important factor with regard to mitigating climate change impacts. **MAPC 29**

It is critical that building design and access be properly planned as this will have a direct effect on the economic attractiveness of the site and the future of the affected communities. At a minimum, in addition to pedestrian and bicycle connections and amenities such as benches, the building design should maximize active public uses at the ground level such as retail and restaurants. To promote pedestrian activity, visual transparency into buildings should be included in addition to designing buildings with multiple entrance and egress points. However, the ground floor construction should also be able to adequately accommodate floodwaters, as described below. **MAPC 30**

<u>Flooding</u>

Page 2-14 of the ENF states that "...all building foundations...will be constructed to withstand flood conditions." In order to best determine how the proposed design will affect flooding conditions, the DEIR should include information regarding proposed base flood elevations of new buildings and specific floodproofing measures. At a minimum, we urge the Proponent to refer to FEMA Technical Bulletin 3-93: *Non-Residential Floodproofing* regarding proactive floodproofing design for commercial structures to ensure that investments will withstand extreme precipitation and flooding conditions. **MAPC 31**

The outline of the base flood zone includes a large portion of the existing horse stables. Although this area of the Project site is subject to the CAFO requirements for water quality, as mentioned earlier, there are no current

[1] General Laws, Chapter 23K, Section 5.

requirements for flood controls within an area such as this. We recommend that the DEIR include a discussion regarding the Proponent's research into flood control measures designed specifically for the level of wastewater from this CAFO. **MAPC 32**

Stormwater

We are encouraged by the Proponent's statement that LID (Low Impact Development) drainage BMPs (Best Management Practices) will be included as part of the site's drainage design. However, conventional stormwater design is not adequate at this site. As previously noted, the Project presents a unique opportunity for the Cities of Boston and Revere to showcase innovative stormwater and green infrastructure techniques. MAPC views the concept of green infrastructure not just as "greener" methods of managing stormwater, but the use of greenspaces for multiple benefits such as park and recreation areas, as well as natural flood control pathways. We strongly encourage the Proponent to include these types of practices throughout all public spaces of the Project site. MAPC is in the process of preparing technical guidance for Green Infrastructure within urban areas. In the interim, the EPA's Green Infrastructure guidance (http://water.epa.gov/infrastructure/greeninfrastructure/index.cfm) provides information regarding various uses and design elements. **MAPC 33**

Page 2-14 of the ENF states that "...ongrade parking design for will allow gravity-controlled stormwater flows to exit the Project site." This statement indicates that the design of the stormwater system will move water offsite rapidly to the adjacent properties. This raises significant concerns that this design will exacerbate flood conditions in the surrounding neighborhoods, particularly Crescent Heights to the north and the adjacent Global Oil site to the northwest. The DEIR should include proposed stormwater measures that will contain and control floodwaters onsite. Eventually, conceptual designs created should utilize updated precipitation data for New England such as the Cornell Extreme Precipitation. In addition, design should also include the 100-year flood criteria, as well as the 500-year scenario, to account for more frequent and extreme flooding conditions. **MAPC 34**

Table 4-7 references an additional 58,000 gallons per day of water consumption for irrigation only. This is a significant increase in the use of potable water merely for landscaping. We strongly recommend that the DEIR include a discussion regarding reuse of collected rainwater for landscape irrigation in order to greatly reduce the need for this considerable additional water usage. **MAPC 35**

Wetlands Impacts

Project activities are proposed within the 100-year floodplain, the 100-foot Buffer Zone to Bordering Vegetated Wetlands (BVW) and Inland Bank, and the 25-foot Riverfront Area associated with Sales Creek.

The Proponent references an agreement made by the EEA Secretary on March 12, 1999 regarding a Densely Developed Exemption from the Massachusetts Wetlands Protection Act Riverfront Area performance standards, which impacts this site. This is a critical component of determining resource area boundary and potential impacts. Therefore, the DEIR should include a copy of the EEA letter or agreement pertaining to this exemption. **MAPC 36**

Page 4-5 discusses impacts and mitigation in compliance with the MA Wetlands Protection Act performance standards for Bordering Land Subject to Flooding (BLSF), and further states that such impacts and mitigation will be "explained in further detail in the DEIR." We request that the DEIR provide adequate information to determine whether proposed compensatory storage is provided equally at the same elevation that storage is being removed, and that this is a separate volume than that required for peak rate attenuation under Standard No. 2 of the Stormwater Management Policy. A preliminary plan showing areas of fill within the 100-year floodplain and all areas of proposed storage should be submitted prior to an FEIR document and/or upon submittal of a Notice of Intent with the Boston and Revere Conservation Commissions. **MAPC 37**

The ENF also states that "it is expected that the off-site Project work associated with the Route 1A improvements will likely not occur within any wetland resource areas other than approximately 40,000 sf of Land Subject to Coastal Storm Flowage (LSCSF)." The DEIR should quantify and qualitatively describe impacts to LSCSF, since these are critical areas for flood control. These areas are significant to storm damage prevention and flood control, protection of wildlife habitat and the prevention of water pollution. Generally, LSCSF contains areas where the water table is close to the surface, where pollutants in a flood plain could affect public health and water supplies, groundwater quality, wildlife, and fisheries. **MAPC 38**

Belle Isle and Sales Creeks

The Project site includes portions of Sales Creek and abuts Belle Isle Creek, which are both included in the Rumney Marsh Area of Critical Environmental Concern (ACEC), as regulated under 301 CMR 1200. The Rumney Marshes ACEC has been characterized by the U.S. Fish and Wildlife Service as "one of the most biologically significant estuaries in Massachusetts north of Boston." As such, the Creek and associated wetlands are protected for their unique cluster of natural and human resource values worthy of a high level of concern and guardianship. ACEC's typically include water resources designated as Outstanding Resource Waters (ORW) as defined under the Massachusetts Surface Water Quality Standards; Belle Isle Creek has been designated as Outstanding Resource Waters. The ENF states, "There are no ORWs on the Project site." The ORW associated with the Belle Isle Inlet and Rumney Marshes ACEC is located approximately 400 feet east of the Project site across Bennington Street. The fact that this critical resource area is just outside of jurisdictional boundaries should not exclude the Proponent from meeting the ORW water quality standards, particularly due to the negligible buffer. **MAPC 39**

Greenhouse Gas (GHG) Emissions

The ENF states, "The rationale for not including any of the suggested mitigation measures that would result in a significant reduction of Greenhouse Gas (GHG) emissions will be provided." The proposed Project will generate an approximate additional 24,600 vehicle trips per day (VTD), almost doubling existing conditions and thereby considerably increasing GHG emissions. The DEIR must specify GHG emissions from these proposed increased vehicle trips, in addition to GHG generation from buildings and site use. We encourage the Proponent to fully examine MEPA's revised Greenhouse gas Emissions Policy and Protocol (2010), as well as guidance from EPA's webpage: Measuring Greenhouse Gas Emissions from Transportation (http://www.epa.gov/otaq/climate/measuring.htm). **MAPC 40**

Air Quality

This level of increased VTD will result in an increase in air pollutants; Volatile Organic Compounds (VOC), Nitrite Oxide (NOx), Particulate Matter (PM), and Carbon monoxide (CO). Therefore, we strongly suggest that the DEIR include a scenario that reduces VTD through increased public transportation services, as well as a robust discussion regarding mitigation measures for GHG pollution. Increased public transportation options should include agreements and mitigation towards improved MBTA service and shuttles for both visitors and staff, planning for water transportation via East Boston (Orient Heights), and private bus/shuttle services from points within and outside the Metro Boston area, as described more fully in the Transportation section of this letter. **MAPC 41**

Solid Waste Management/Energy

We support the Proponent's potential inclusion of anaerobic digestion for organic waste diversion and green energy generator. This would provide the Proponent with a significant advantage regarding the proposed organics waste ban in development by MA Department of Environmental Protection. MAPC has been involved as an advisory committee member regarding the ban and reuse of organic material and would be happy to help facilitate the Proponent's conversations and provide technical assistance regarding the subject matter.

LOCATING A CASINO: MUCH AT STAKE FOR HOST COMMUNITY AND REGION

A POLICY STATEMENT BY THE METROPOLITAN AREA PLANNING COUNCIL
DECEMBER 22, 2011

The recent press coverage about the Foxborough casino proposal reminds us all that Massachusetts faces some challenging decisions about where to locate up to three casinos, how to maximize the benefits of these developments, and how to address adverse impacts that could be serious and long-lasting. The Metropolitan Area Planning Council (MAPC), the regional planning agency for Metro Boston,[1] believes that the location of a new casino — not just its size or format — will in large part determine its transportation and environmental impacts, secondary economic effects, necessary public infrastructure investments, and social welfare consequences. The process of permitting a casino should involve a clear discussion of likely negative impacts, steps to eliminate or minimize such impacts, and the best approaches to assuring that short and long-term mitigation strategies reflect the priority concerns of the host municipality and the surrounding area.

As we prepare for this process, MAPC would like to provide some advice based on close to 50 years of experience in dealing with the impacts of major developments.

Pursue a transparent public process from beginning to end

MAPC values transparency in public process and community dialogue to ensure respectful, candid and straightforward communication among local stakeholders and casino proponents. Development proposals should be shared publicly as soon as they are ready, and whenever critical details or changes are added. The process should involve not only the local and state agencies whose approval is required; it should also engage the residents of neighboring communities that will be seriously impacted by a casino, but are unlikely to receive any of the new tax dollars. The process should involve a clear discussion of what likely negative impacts will be, how to minimize those impacts, and how to mitigate any impacts that cannot be eliminated. Focusing primarily on what a developer will

[1] The mission of MAPC is to promote smart growth and regional collaboration in Metropolitan Boston. Our work is guided by our regional plan, "MetroFuture: Making a Greater Boston Region." A critical component of MAPC's mission is to advance equity and cultural competency both internally and in our work throughout the region.

"give" the host community to obtain their support is not the same as a respectful conversation about benefits and impacts, involving both the host and surrounding communities.

Understand and plan for both positive and negative impacts beforehand

Casinos are huge developments, which by their nature bring both positive and negative impacts to a community and to a region. They pay taxes and provide jobs, but they also increase the need for regional road and transit improvements, public safety services, water and sewer infrastructure, and social services. A location needs to maximize economic benefits (in the short term, construction jobs, and in the long term, permanent jobs and tax revenues) while minimizing a host of possible adverse impacts. These negative impacts can include short-term construction disruptions, such as noise, dust, and truck traffic. More importantly, affected communities must also take the longer term view to assure that resources and practices are in place to address:

- increased traffic and transit impacts;
- increased demand for drinkable water and increased production of wastewater;
- storm water run-off, associated pollutants, and changes in drainage patterns;
- stresses on the regional housing stock across a broad range of incomes;
- changing demands for police, fire, and ambulance services;
- location of ancillary business and commercial services nearby, including in some instances services that the community might consider less-than-desirable; and
- an increased need for social services, especially those related to gambling and other forms of addiction.

No location is perfect. All three locations currently in the news in Eastern Massachusetts (Foxborough, Milford, and Suffolk Downs in Boston/Revere) have their pluses and minuses. The recently-approved casino legislation allows local residents in host communities to vote on whether they want the casino; it also allows surrounding communities (if they are determined eligible by the Gaming Commission) to receive reasonable mitigation for adverse impacts, such as the need for road improvements to address traffic. Nonetheless, the characteristics of proposed casino locations will make some sites inherently more suitable than others.

Deal with traffic and transit

In most locations, we must assume that the majority of casino guests, as well as workers, will arrive by automobile. It is critical to determine if the proposed casino can be served by the existing roadway system. Sometimes roads can be adequately improved with mitigation funds from the developer, but in other cases state and federal resources are required to retrofit the roads adequately. Such public resources are very scarce and they are needed to improve travel safety, to ease traffic flow, or to provide transit for thousands of area residents and businesses. Such projects should have a higher priority in implementing the state's economic development aims.

A hypothetical casino including 175,000 square feet of gaming space, 350 hotel rooms, 30,000 square feet of restaurants, and 30,000 square feet of retail will add some 3,000 vehicle trips during the peak AM and PM commuting times, as well as additional traffic during other times of the day and week.[2] If some of those trips could be made, instead, by transit or other common carriers, traffic

[2] Peak Hour traffic generation is based upon *Trip Generation* (7th edition) by the Institute for Transportation Engineers; traffic volume by guests and employees outside of rush hours is much harder to quantify.

impacts for the host and nearby communities would be less onerous. It could also be less costly for taxpayers who would be asked to fund fewer proposals for new interchanges, roadway widening projects, additional traffic signals, etc. There is also strong reason to believe that the presence of a casino leads to an increase in alcohol-related traffic accidents and fatalities.[3] Locating a casino that is transit-accessible could not only decrease these types of traffic accidents but also conserve police, fire, and medical resources.

Transit availability is especially important for employees, not only during typical commuting hours, but also at other times of the day and week when casino employees are likely to arrive at and leave work. Out-of-area commutes for employees can increase their costs (negatively affecting workers' incomes) and contribute to traffic congestion. A range of transit options (e.g., subway, trains, buses, and limousine vans) could mitigate traffic generated by guests if it is provided in an appropriate manner and with sufficient frequency. In regard to both roadways and transit (including pedestrian facilities), it is important that any casino developer dedicate adequate resources — both at the time of development and over the longer-term — to appropriately upgrade service without burdening either municipal or state resources.

Think about water as well as cars

Hotels, restaurants, and gaming facilities consume large volumes of drinking water. Looking at examples of other casino complexes, water use can exceed 300,000 gallons per day. A municipal water (and wastewater) system that can handle such use would help to make a location more suitable. Many municipal systems would find it difficult or impossible to meet such a demand without taking extraordinary and costly measures.

Access to a labor force is a distinct advantage

This is especially true if that labor force can provide both high skilled and service workers needed for a casino operation. If the casino is built in an area where few workers currently live, it will require long and costly commutes. Additional residential development may be needed to provide local housing for casino workers in the host and surrounding municipalities. While housing production is usually an advantage for a community, large housing developments in small communities can add service demands. There is also the risk of isolating casino workers and their children in developments that are segregated from the community at large. If adequate housing is not built, for-sale and rental costs could rise. Alternatively, locating such a facility near a concentration of workers may provide an opportunity to help some of our more disadvantaged residents to rejoin the economic mainstream.

In conclusion, MAPC is neither for, nor against, casino gambling. Our members include communities and individuals who support casino gambling, and others who oppose it. However, now that the Commonwealth has adopted a statute governing the siting and regulation of such facilities, the question of where to place a casino in Eastern Massachusetts constitutes a major and complicated civic decision for the state, the host community, and surrounding cities and towns. MAPC stands ready to participate in these discussions to choose the best possible location, and to quantify and address all negative impacts.

[3] Buckhurst Fish & Jacquemart Inc. (2001). *Bridgeport Casino Traffic Impacts on the South Western Region of Connecticut, Final Report: July 2001*. (pp. 2-3) New York: Buckhurst Fish Jacquemart, Inc.

METROPOLITAN AREA PLANNING COUNCIL

MAPC 01 **It is important to understand the geographic distribution of patrons and employees for this regional destination. Where will these trips originate, and what highways will drivers utilize (e.g., I-90, I-93, Route 1, Route 1A, Route 16)? In addition to the local traffic analysis required in a typical MEPA analysis, this DEIR should address the regional impacts of Project-related traffic.**

The geographic distribution of patron and employee trips is presented in Sections 5.4.7 and 5.4.8. The transportation study area has been defined by MassDOT to capture regional as well as local traffic impacts, as presented in Section 5.7.

MAPC 02 **While the ENF states the DEIR will include a No-Build traffic analysis based on the projection of traffic volumes for a "horizon" year of 2020, the projections are for the year 2017. At a minimum, the analysis of the traffic impacts should be for ten years (as was done for the Project First Light Destination Resort Casino ENF in Taunton).**

The DEIR/EPNF traffic analysis horizon year is 2022.

MAPC 03 **The DEIR needs to explain the peak periods related to this Project as well as analyze the potential for overlap between commuter peak periods and casino peak periods, with particular focus on Fridays.**

The DEIR/EPNF traffic analysis in Section 5.0 is based on the worst combinations of roadway peak and Project peak, which are identified as the Friday afternoon peak commuter hour (5-6 p.m.) and Saturday afternoon peak hour (4-5 p.m.).

MAPC 04 **The Proponent needs to address the likelihood of an increase in accidents as part of its study of area crash data. The Proponent should take into account accidents involving patrons travelling to and from the Project by vehicle, bicycle, and foot, even when those accidents occur relatively far from the site itself. The DEIR should include a clear explanation of steps the Proponent will take to minimize drunk driving and the accidents that occur as a result, especially in regard to patrons leaving the facility.**

While there will be an increase in traffic on the roadway network supporting the Project site, this does not suggest a corresponding increase in crashes. Significant roadway, traffic, and pedestrian safety improvements will be provided by the Project, some of which will address pre-exiting safety issues (see Section 5.0).

MAPC 05 **According to the ENF, the majority of patrons are expected to travel by auto and the majority of employees are expected to travel by transit and shuttle service. The DEIR should outline a monitoring program to ensure that specifically defined mode share goals for both patrons and employees are accomplished. Along with specific steps to achieve these goals, the monitoring program should cover a defined period.**

The TDM plan presented in Section 5.9 includes monitoring commitments to be developed in coordination with MassDOT, BTD, and others.

MAPC 06 **The DEIR should build upon the mitigation described in the ENF and outline when it will be implemented as well as how it will be monitored and enforced. The Proponent will need to continue to work with MassDOT, DCR, Boston, and Revere in addition to the surrounding communities to develop a comprehensive mitigation program. The scope and schedule of proposed mitigation should be clearly outlined as part of the MEPA process. Parties responsible for funding, implementation, and maintenance should be clearly defined as well.**

The improvements to be made under the HCAs with the cities of Revere and Boston are described in Sections 5.5 and 5.6. The Proponent will work with MassDOT, DCR, Boston, and Revere in developing designs for these improvements, the scope, schedule, and responsibilities for which will be outlined as part of the MEPA process.

MAPC 07 **The ENF has indicated these improvements could include a Route 1A northbound flyover at Boardman Street, an additional Route 1A southbound lane, and the signalization of the Route 1A/Waldemar Avenue and Route 1A/Tomasello Drive intersections. The design of these improvements will need to be developed in consultation with MassDOT and area communities to address existing local and regional traffic challenges, improve safety, and provide capacity to accommodate Project trips entering and exiting the site.**

The Route 1A infrastructure improvements will be developed in consultation with MassDOT, BTD, the City of Revere, and residents of the local communities.

MAPC 08 **Improvements to Route 1A will need to significantly improve safety and traffic capacity in the vicinity of the Project site, with reduced queuing and delays for both local and regional traffic as well as access to the site. Efficient travel along 1A will be challenging and the DEIR needs to address this in more detail.**

Safety and traffic capacity improvements for regional traffic and local access are key objectives of the proposed Route 1A infrastructure improvements.

MAPC 09 **Proposed changes to Route 1 need to be consistent with MassDOT's proposal to widen and relocate a portion of Route 1 in Revere, Malden, and Saugus. This 2.4-mile project begins 1,500 feet south of the Route 1/Route 60 interchange (Copeland Circle) and proceeds north through the Route 1/Route 99 Interchange.**

The proposed improvements to the Route 1/Route 16 interchange are consistent with the proposal to widen and relocate a portion of Route 1 in Revere, Malden, and Saugus.

MAPC 10 **While the Proponent has mentioned providing bicycle storage racks near the front doors of the facilities, it is important that the Project have convenient, secure indoor bicycle parking for both patrons and employees. There should be additional consideration to allocating space for showers and changing rooms for the employees in the buildings.**

Bicycle amenities including valet parking, storage, and showers are described in Section 1.4. As described in Section 5.8.3, the number of bicycle parking spaces to be provided is based on BTD Bicycle Guidelines.

MAPC 11 **As part of its mitigation program, the Proponent should fund the expansion of Hubway stations at Suffolk Downs station and other locations in East Boston, Winthrop and Revere.**

The Project includes two Hubway stations, the locations for which were determined in coordination with BTD and representatives from the City of Revere. Infrastructure will be installed to support the two stations, and they will be deployed at the Proponent's cost when the City deploys its East Boston Hubway system.

MAPC 12 **The pedestrian and bicycle connections should be designed with safety in mind, especially at night. MAPC looks forward to reviewing more details of a lighting program both in and around the Project.**

Section 4.4 describes full-cutoff, energy-efficient site lighting.

MAPC 13 **MAPC strongly encourages the Proponent to explore using innovative permeable paving technologies and other landscaping uses that facilitate drainage and stormwater management. It is important that surface parking spaces are well landscaped, pedestrian-friendly, and have permeable surfaces.**

The Project design will incorporate permeable pavers into pedestrian plazas and walkways to the maximum extent practicable (see Section 4.4). Surface parking lots will utilize conventional pavement due to the high level of vehicle activity and soil conditions in those areas.

MAPC 14 **MAPC suggests that the Proponent consider implementing a program that will phase in surface parking spaces as demand warrants subsequent to the construction of the parking garage and full occupancy of the Project.**

The Proponent currently intends to construct all surface parking spaces during the single construction period.

MAPC 15 **The ENF mentions that while patron cars will be accommodated on site, it is anticipated that employee cars will be accommodated only during off-peak parking demand periods. Where will employees park during peak demand periods? It is important to keep parked cars associated with the Project out of area neighborhoods.**

As described in Section 5.10.3, with the exception of limited parking for management and essential staff, no employee parking will be provided on the Project site. Rather, employees will park in multiple geographically-dispersed locations connected to the Resort by continuous shuttle bus service. Notwithstanding this, the Proponent has committed to supporting host community initiatives to protect neighborhood streets by expanding parking restrictions and the resident parking permit programs.

MAPC 16 **The DEIR should explain whether there will be a fee for patrons to park in the garage or surface lots. MAPC strongly encourages the Proponent to consider incorporating a fee for funding the TDM program, the Community Improvement Fund, or mitigation for environmental impacts.**

While patron parking on-site will be managed to avoid misuse such as commuter park-and-ride activity, the Proponent is not proposing to charge fees for parking.

MAPC 17 **The Proponent has mentioned that events such as corporate gatherings and weddings will take place at the Project. The DEIR should address what will occur in the event of parking overflow.**

Overflow parking will provided on the Project site to accommodate special events. These overflow parking spaces will consist of reinforced turf parking areas near the loading areas to Casino Area I.

MAPC 18 **The DEIR should provide information regarding the estimated number, size, and frequency of trucks accessing the Project site. In particular, information regarding how trucks will access the Project site and where they will originate should be provided (e.g., will trucks be required to access designated roadways? What routes will they take? What is the schedule of regular truck visits? What steps can be taken to minimize noise disruption to surrounding neighborhoods?).**

Trucks accessing the site to service the Resort will be subject to a management plan enforced by the Proponent. Under this plan, state and city idling laws will be enforced and the timing and routes for deliveries will be managed to minimize impacts to surrounding neighborhoods. It is anticipated that approximately 25 trucks will access the site each day from the Winthrop Avenue entrance.

MAPC 19 **It is important that the TDM plan be tailored to the differing needs of patrons and employees. For example, due to the 24/7 operations of a casino, employees will be working in shifts. It is important that employee shift changes take place during times when the MBTA is operating.**

The comprehensive TDM plan presented in Section 5.9 is designed to address the differing needs of patrons and employees. There will be multiple shift changes spread throughout the day, and the Proponent has committed in the TDM plan to adjusting employee shift times to the extent possible to reflect transit availability.

MAPC 20 **In addition to joining the Logan Airport TMA, the Proponent should consider providing patrons with MBTA passes (Day/Week Link Pass) in addition to giving MBTA passes to employees (Monthly Link Pass) as incentives to use public transportation.**

The Proponent has committed to join the Logan TMA and subsidize employee MBTA passes, along with many other incentives included in the TDM plan presented (see Section 5.9).

MAPC 21 **In addition to promoting public transportation, the Proponent should provide a high frequency shuttle bus that picks people up at the MBTA station and drops them off directly in front of the casino. The shuttle bus should offer frequent service on a continuous basis at no cost to passengers.**

The Proponent has committed to providing enhanced continuous shuttle bus service between Suffolk Downs Station and the Resort entrances (see Section 1.1.1.2).

MAPC 22 **MAPC looks forward to reviewing a more detailed analysis in the DEIR that includes shuttle services that would:**

- **Provide access to and from Logan Airport, water transportation terminals, local area hotels, downtown Boston, the Boston Convention and Exhibition Center, and the Black Falcon Cruise Terminal.**
- **Connect with other regional entertainment and tourism venues.**

The proposed shuttle plan for the Project is presented in Section 5.8.4, and includes all of the suggested potential service connections.

MAPC 23 **The DEIR should outline how the Proponent will coordinate with the MBTA, specifically regarding how connections between Suffolk Downs station and the Project can be enhanced. In addition, the Proponent should consider partnering with the MBTA by contributing to the operating costs of the Blue Line or area bus lines in an amount that is reasonably related to the Project's additional demand.**

The Proponent has discussed the enhanced shuttle service at Suffolk Downs Station with the MBTA, including an improved connection between the shuttle stop and the station entrance. Potential impacts to the MBTA Blue Line and bus routes are presented in Section 5.8.1, and the Proponent will continue to coordinate with the MBTA in this regard.

MAPC 24 **The DEIR should describe any plans to coordinate with Massport regarding a potential water/bus shuttle system from downtown Boston to East Boston and the Project site or other water shuttle service connections.**

The Proponent has committed in the Boston HCA to support the City of Boston's initiative to provide water transportation to the East Boston waterfront, and to providing a shuttle connection from the dock to the Resort.

MAPC 25 **The DEIR needs to analyze the estimated number and peak periods of charter bus activity. While the ENF describes the designated area for charter bus pick-up/drop-off, it does not indicate where and for how long they will layover (e.g., How will the charter buses access the Project site and where will they be coming from? Will the charter buses be required to access designated roadways? What steps will be undertaken to minimize idling?).**

Charter buses will access the Project site from the Winthrop Avenue entrance and will be required to use designated roadways. Buses will pick up and drop off in a designated area on the site and will be required to park off-site to avoid unnecessary idling.

MAPC 26 **While the ENF does not mention any signage programs, the DEIR needs to describe the proposed regional and local signage program. MAPC strongly discourages the installation of digital video display signs or billboards as part of this Project.**

The Proponent will work with MassDOT, DCR, and the cities of Revere and Boston to develop appropriate directional signage to the Resort. The Proponent is sensitive to its relationship with host and surrounding communities, and will work to ensure exterior signage and lighting provides visual aesthetics for the Resort without negatively impacting surrounding communities.

MAPC 27 **Analysis of likely ancillary development activity and related impacts on land owned and not owned by the Proponent should be conducted to understand all potential impacts of the proposed Project. There should be particular attention to new housing, the impact on home values, the retail plaza abutting the Project site on Furlong Drive, and the 34-acre Wonderland Greyhound Park property owned by Suffolk Downs at Wonderland on the Blue Line.**

Please see the response to NEC 08.

MAPC 28 **Although wastewater pollution and mitigation measures were briefly described in the ENF, stormwater management of the CAFO was not made apparent, which brings into question whether the site would require an individual NPDES permit…**

In May 2008, EPA directed Suffolk downs to apply for an individual NPDES permit for all discharges from the CAFO to navigable waters; Suffolk Downs submitted its application for a NPDES permit in September 2008. The application included a nutrient management plan pursuant to 40 CFR §122.42(e). EPA published a draft NPDES permit (EPA NPDES Permit no. MA0040282) for public comment as of March 1, 2013, along with a fact sheet that fully describes the Suffolk Downs CAFO stormwater and process water management systems. The draft permit and fact sheet are available at http://www.epa.gov/region1/npdes/permits/draft/2013/draftma0040282permit.pdf. EPA's public comment period on the proposed NPDES permit closed on March 31, 2013.

MAPC 29 **While MAPC is pleased the Proponent is striving for LEED Gold certification, the ENF does not include information regarding how the building design would meet LEED criteria, nor does it explain how the Project will comply with the City of Boston's Article 37: Green Buildings…**

Section 2.2 includes a summary LEED NC 2009 scorecard demonstrating the Proponent's commitment to achieving LEED Gold Certification, a detailed analysis of the LEED NC 2009 prerequisites and credits the Project is targeting for achievement, and a summary statement regarding how the Project complies with the requirements of the City of Boston's Article 37 (Green Buildings).

MAPC 30 **At a minimum, in addition to pedestrian and bicycle connections and amenities such as benches, the building design should maximize active public uses at the ground level such as retail and restaurants. To promote pedestrian activity, visual transparency into buildings should be included in addition to designing buildings with multiple entrance and egress points. However, the ground floor construction should also be able to adequately accommodate floodwaters…**

The Project description in Section 1.0 addresses activation of the ground level. Resort resiliency from flooding and climate change is described in Section 2.3.

MAPC 31 **In order to best determine how the proposed design will affect flooding conditions, the DEIR should include information regarding proposed base flood elevations of new buildings and specific floodproofing measures. At a minimum, we urge the Proponent to refer to FEMA Technical Bulletin 3-93: *Non-Residential Floodproofing* regarding proactive floodproofing design for commercial structures to ensure that investments will withstand extreme precipitation and flooding conditions.**

The proposed first-floor levels of the buildings will be considerably higher than the 100-year flood elevation: the 100-year flood elevation is 15.46 feet (BCB), and the proposed first-floor elevation of the casino buildings is 28 feet. Section 2.3 addresses climate change adaptation, and Sections 2.3.6 and 4.5 describe how the site design is responsive to sea level rise. No building construction is proposed within the flood zone.

MAPC 32 **We recommend that the DEIR include a discussion regarding the Proponent's research into flood control measures designed specifically for the level of wastewater from this CAFO.**

The Project includes construction of a maintenance building and parking area in a part of the existing CAFO. Stormwater generated from this area will no longer be discharge to the CAFO sanitary system; therefore, the existing system will have expanded capacity to accommodate flows. Furthermore, the pond has a capacity to hold a 50-year storm event. Suffolk Downs is required to keep surfaces swept and manure-free, and manure is stored in precipitation-tight containers. Manure trailers would be removed in event of a flood. Section 9.1 describes Resort wastewater.

MAPC 33 **MAPC views the concept of green infrastructure not just as "greener" methods of managing stormwater, but the use of greenspaces for multiple benefits such as park and recreation areas as well as natural flood control pathways. We strongly encourage the Proponent to include these types of practices throughout all public spaces of the Project site.**

Section 4.5 describes the Resort's green infrastructure that will also serve as an aesthetic and civic amenity.

MAPC 34 **Page 2-14 of the ENF states that "… ongrade parking design will allow gravity-controlled stormwater flows to exit the Project site." This statement indicates that the design of the stormwater system will move water off-site rapidly to the adjacent properties. This raises significant concerns that this design will exacerbate flood**

conditions in the surrounding neighborhoods, particularly Crescent Heights to the north and the adjacent Global Oil site to the northwest. The DEIR should include proposed stormwater measures that will contain and control floodwaters onsite.

The Project will not increase the flow of stormwater off-site, and will result in a net reduction in impervious surface on the Project site; therefore, the total stormwater generated by the Project site will decrease relative to existing conditions. A series of BMPs are included in the design of the proposed stormwater management system to improve the quality and reduce the quantity of stormwater flowing from the site. These measures include bioretention basins, water quality swales, pervious pavers, bioswales, and rainwater reuse tanks (see Section 9.3).

MAPC 35 **We strongly recommend that the DEIR include a discussion regarding reuse of collected rainwater for landscape irrigation in order to greatly reduce the need for this considerable additional water usage.**

The Project design includes three large rainwater reuse tanks to collect stormwater from the rooftops. These tanks will collectively have a 270,000-gallon capacity and will result in an annual water savings of over 4.5 million gallons per year. Collected rainwater will be used for on-site landscape irrigation, track watering, and cooling water tower demand.

MAPC 36 **The Proponent references an agreement made by the EEA Secretary on March 12, 1999 regarding a Densely Developed Exemption from the Massachusetts Wetlands Protection Act Riverfront Area performance standards, which impacts this site. This is a critical component of determining resource area boundary and potential impacts. Therefore, the DEIR should include a copy of the EEA letter or agreement pertaining to this exemption.**

To clarify, the Proponent is not claiming any exemptions from the Wetlands Protection Act regulations or performance standards, including but not limited to RFA associated with Sales Creek on the Project site. Information demonstrating compliance with the WPA performance standards is provided in Section 6.9. The DDA designation referenced in the comment letter simply refers to the width of the Sales Creek RFAs as being 25 feet in the City of Revere versus the normal 200 feet prescribed by the regulations. The RFA is also 25 feet wide in the City of Boston, consistent with 310 CMR 10.58(2)(a)3.a. A copy of the Approval of the Secretary of EEA of a Designation of a DDA was provided as Attachment G to the ENF.

MAPC 37 **We request that the DEIR provide adequate information to determine whether proposed compensatory storage is provided equally at the same elevation that storage is being removed, and that this is a separate volume than that required for peak rate attenuation under Standard No. 2 of the Stormwater Management Policy. A preliminary plan showing areas of fill within the 100-year floodplain and all areas**

of proposed storage should be submitted prior to an FEIR document and/or upon submittal of a Notice of Intent with the Boston and Revere Conservation Commissions.

Approximately 615,000 square feet of BLSF will be altered on the Project site (see Section 6.9.1.2). The Project will not result in any loss of flood storage; although grading work will occur in the 100-year floodplain, this work will include both filling and cutting. As demonstrated in Table 6-34, compensatory flood storage will be provided for all flood storage volume that will be permanently lost as a result of Project construction. The volume will be created in an area not previously used for flood storage and will be incrementally equal to the theoretical volume of flood water lost at each elevation, up to and including the 100-year flood elevation, which will be displaced by the Project. Section 2.3 addresses floodplain issues.

MAPC 38 The ENF also states that, "it is expected that the off-site Project work associated with the Route 1A improvements will not likely occur within any wetland resource areas other than approximately 40,000 sf of LSCSF." The DEIR should quantify and qualitatively describe impacts to LSCSF…

Potential impacts to off-site wetlands associated with proposed off-site infrastructure improvements are described in Section 6.9.2.

MAPC 39 The ORW associated with the Belle Isle Inlet and Rumney Marshes ACEC is located approximately 400 feet east of the Project site across Bennington Street. The fact that this critical resource area is just outside of jurisdictional boundaries should not exclude the Proponent from meeting the ORW water quality standards, particularly due to the negligible buffer.

The Project will meet and exceed MassDEP Stormwater Management Guidelines for water quality treatment in critical areas, and the Project will improve the water quality of stormwater discharges into Sales Creek and ultimately Belle Isle Inlet and Rumney Marshes ACEC (see Section 9.3).

MAPC 40 The proposed Project will generate an approximate additional 24,600 vehicle trips per day, almost doubling existing conditions and thereby considerably increasing GHG emissions. The DEIR must specify GHG emissions from these proposed increased vehicle trips, in addition to GHG generation from buildings and site use.

GHG emissions from mobile sources are included in the GHG analysis in Section 7.5.

MAPC 41 This level of increased vehicle trips per day will result in an increase in air pollutants: VOC, NOx, particulate matter, and carbon monoxide. Therefore, we strongly suggest the DEIR include a scenario that reduces vehicle trips per day

through increased public transportation services as well as a robust discussion regarding mitigation measures for GHG pollution. Increased public transportation options should include agreements and mitigation towards improved MBTA service and shuttles for both visitors and staff, planning for water transportation via East Boston (Orient Heights), and private bus/shuttle services from points within and outside the Metro Boston area...

The Proponent is committed to implementing a robust TDM plan, as described in Section 5.9. Benefits of the TDM plan will be accomplished as part of the Project implementation, and these benefits are already assumed under the Build condition. Mitigation measures for GHG emissions are described in Section 7.0.

Environmental and Energy Services
CITY OF BOSTON

THOMAS M. MENINO
Mayor

BRIAN R. SWETT
Chief of Environment and Energy

March 26, 2013

Secretary Richard K. Sullivan
Executive Office of Energy and Environmental Affairs
Attn: MEPA Office
100 Cambridge Street, Suite 900
Boston, MA 02214

Subject: *Environmental Notification Form (ENF) Review*
Caesars Resort at Suffolk Downs, EEA No. 15006

Dear Secretary Sullivan:

The City of Boston is pleased to have the opportunity to comment on the Caesars Resort at Suffolk Downs Environmental Notification Form (ENF) filed with the Massachusetts Environmental Policy Act (MEPA) Office on January 31, 2013. The City of Boston (City) is a leader in environmental sustainability and energy efficiency. As such, the City and specifically the Environment and Energy Services cabinet (EES) has very high standards.

General Policy Goals

Below is a list of overarching policies and goals that the City recommends the proponent consider: **BOS 01**

- Reduce energy intensity to the maximum extent possible;
- On-site alternative energy generation to the maximum extent possible;
- Strive to achieve LEED Platinum status;
- Conserve, maximize efficiency and reuse water to the greatest extent possible;
- Seek innovative green attributes;
- Maximize Transportation Demand Management opportunities for all guests and staff; and
- Create a standard for sustainable resort operations and maintenance.

Scope of the Comments

The following comments, prepared by the City and our consultant CDM Smith, offer remarks on the scope of the Draft Environmental Impact Report (DEIR) and on the proponent's latest design concepts, as presented at the March 6, 2013 MEPA consultation session. We note

SUITE 603 • ONE CITY HALL SQUARE • BOSTON • MASSACHUSETTS • 02201
617-635-3425 Fax: 617-635-3496

that some of these assessments and recommendations may pertain to topics and review that is part of the City's own review process; but we have included it herein to allow your office to understand the City's comments on the proposal.

While the scope of this letter is limited to environmental assessments, the City's interests and review extend well beyond these issues. As such, a second letter is also being submitted to your office by the City commenting on transportation elements of the proposal. *See attached March 26, 2013 City of Boston Transportation Department Letter.*

We have reviewed the Secretary's thorough August 24, 2012 certificate on the Project First Light-Destination Resort Casino (EEA No. 14924) and concur that the DEIR scope requirements and level of detail in the areas listed below also pertain to the Caesars Resort project.

- Alternatives Analysis
- Traffic and Transportation
- Greenhouse Gas Analysis
- Wastewater
- Land
- Wetlands
- Rare Species
- Hazardous Materials
- Historic Resources
- Construction Management
- Mitigation

We suggest similar scope requirements for the Caesars Resort project DEIR.

In addition, we offer the following recommendations on DEIR scope requirements for the Caesars Resort project, presented by topic. Note that while some of these recommendations may pertain to topics that will be part of the City's review process, and/or the Boston Redevelopment Authority (BRA) review process, we have nonetheless included them herein because the filed ENF also addresses them.

General

1. The proponent presented some new design and sustainability concepts at the March 6, 2013 MEPA consultation session that are not reflected in the ENF filed on January 31, stating that the project will connect nature, people and place and that it will be the "greenest" casino in the country. We are encouraged by Suffolk Downs' pledge for a **BOS 02**

particularly green development, including new plans to reduce pavement by 30% and transform current asphalt into a natural landscape. We expect that the DEIR will describe these general comments in more detail.

2. The ENF cites 2017 as the Build Year and 2020 as the Horizon Year. We suggest that the final Horizon Year be selected with MEPA, MassDOT and MassDEP input (for State Implementation Plan target years), and that it be a year that represents full operation of the project plus reasonably foreseeable growth induced by the project. **BOS 03**

3. The study area for each topic in the DEIR should be clearly specified and justified. **BOS 04**

4. Impacts of proposed mitigation, as well as direct and indirect effects, and cumulative effects should be addressed in the DEIR. **BOS 05**

5. The DEIR should include a description of plans for renovating the existing race track and plans during and after construction. Any intensification of use of the race track facilities over existing conditions as induced by increased visitors to the casino should also be identified and included in the impact analysis. **BOS 06**

Energy and Greenhouse Gas Analysis

1. At the March 6 MEPA consultation session, the proponent indicated that anaerobic digestion, solar photovoltaic, and geothermal energy would be part of the project. We encourage the proponent's commitment to renewable energy, and look forward to a more detailed analysis and description in the DEIR of these and other innovative technologies including: **BOS 07**

   - Anaerobic digestion using wastewater sludge, horse manure, food waste and other nearby organic wastes to produce biogas for use in combined heat and power systems or to produce biofuels for on-site vehicle use
   - Combined heat and power (CHP) systems using natural gas and/or digester gas (engine generators, microturbines, fuel cells, etc.)
   - Solar photovoltaic (including power purchase agreements)
   - Solar thermal
   - Building integrated solar
   - Wind turbines
   - Low-impact hydroturbines
   - Geothermal
   - Water source heat pumps
   - Sewer heat recovery
   - Biofuels

- Biomass boilers
- Purchasing green power

2. The ENF states that the proponent will conduct a greenhouse gas (GHG) emissions analysis in accordance with the MEPA GHG Emissions Policy. The list of GHG sources and proposed approach in the ENF appears complete. The ENF states that both Boston and Revere are Energy Stretch Code communities, requiring high standards for efficient energy use in buildings. The ENF then states that these standards will be included in the "preferred case," but not in the "baseline case" that would be used as comparison. The DEIR should examine the Stretch Code requirements in the "baseline case," along with reasonable energy conservation measures that would be encouraged for any new development at the site, and then show how this project may go beyond these measures. **BOS 08**

Climate Change Preparedness

1. The City will consider its own climate change preparedness goals in evaluating the proposal.

2. Although sea level rise is discussed in the greatest detail, the ENF acknowledges that other climate change impacts should also be addressed and indicates that the DEIR will include analysis of the following:

   - Storm surge
   - Increased frequency/severity of storms
   - Rising temperatures
   - Increased frequency of extreme heat days
   - Precipitation changes

Sea Level Rise and Storm Surge

1. In design review, the City will look for protection for the community in relation to sea level rise and storm surge. The ENF used the historic sea level rise value of 2.65 mm/yr. The ENF assumes a linear progression of sea level rise over the 100-year period, which does not account for the potential for future acceleration in the rate of sea level rise. The ENF also states that sea level rise would be 10.44 inches over the next century. The MA Executive Office of Energy and Environmental Affairs (EEA) Climate Change Adaptation Report suggests a more conservative sea level rise range, taking uncertainty associated with United Nations Intergovernmental Panel on Climate Change (IPCC) models into account, of 1 to 6 feet by the end of the century. The proponent has acknowledged the EEA Climate Change Adaptation Report, and has stated that the DEIR will evaluate site design for consistency with this Report. **BOS 09**

2. The ENF looked at the relationship of the first floor elevation to flood elevation. It is more appropriate to compare the ground floor to flood levels, allowing for the protection of all **BOS 10**

critical infrastructure. The proponent has agreed to consider both the ground floor, and critical underground infrastructure, for vulnerability to flooding in the DEIR. We recommend the proponent also consider protection of chemicals, manure and other potential pollutants from a flooding event. The City will pursue from the proponent design plans and analysis for the impacts of sea level rise and storm serve on the transportation and energy reliably of the site.

3. The DEIR should evaluate the floodplain, including the Flood Insurance Rate Maps, the 100-year flood plain in the project area, and coastal storm flood issues. If necessary under storm surge conditions, we also suggest that the DEIR evaluate a potential operation of a pumping station. **BOS 11**

4. 310 CMR 10.57(4) states that the compensatory storage shall have an unrestricted hydraulic connection to the adjacent water body, meaning that the proposed development plans need to be examined to confirm that existing flow paths are not severed, which can result in localized flooding. This issue should be addressed in the DEIR. **BOS 12**

5. The DEIR should also consider and evaluate the impacts on flooding of adjacent sites as it may impact the proposed site. **BOS 13**

Sustainable Design and LEED

1. At the March 6 MEPA consultation session, the proponent stated its intent to make the project the "greenest" casino in the country, yet the ENF indicates that the project will strive for LEED Gold, which is required in the Expanded Gaming Law, *see* M.G.L. c. 23K, § 18 (8). The DEIR should describe in detail how the project will be certified as LEED Gold or higher. **BOS 14**

2. Sustainable strategies should not be limited to or by LEED credit thresholds and certification. The DEIR should include consideration of alternative rating systems and metrics that may provide measurable long-term benefits to the project. **BOS 15**

3. It appears that the LEED scorecard in the ENF needs to be updated in the DEIR to reflect the proponent's additional sustainability commitments as presented at the March 6 MEPA consultation session. We offer the following comments on the ENF scorecard to assist the proponent in making revisions: **BOS 16**

   - The ENF indicates that the project will be LEED Gold certifiable (60 – 79 points); however, the scorecard indicates a total of 58 points. Typically projects attempt several "extra" credits in case USGBC rejects, or the project misses on, any given credit. This is a minimal effort for LEED certification with most credits coming from non-Energy/Water credits. While the ENF states that the project will set a "new standard" for sustainable gaming facilities, the described sustainable strategies and LEED scorecard indicate only the minimum requirements..
   - LEED Scorecard breakdown:

- Only minimal points are attempted in the Energy and Atmosphere category with no points for On-site Renewable Energy even though the project description mentions possible photovoltaic installation. The ENF indicates on-going investigation with regard to installing solar arrays. These may provide the "visual" sustainable image desired by City of Boston but may not provide enough power to make a significant impact on the project's energy consumption of meet the LEED threshold for credit compliance.
- Only minimal points are attempted in Water Efficiency with no points in Wastewater Technologies.
- Sustainable Sites Credit 8 Light Pollution Reduction is not attempted. While it may be difficult for this type of project to achieve the LEED threshold for this credit, there should be some discussion on the strategy to limit light trespass into the adjacent residential neighborhoods.
- Only minimal points are attempted in Materials and Resources.
- Less than half of the Indoor Environmental Quality (IEQ) credits are attempted. The ENF indicates that the project will not meet IEQ credit for low-emitting flooring systems. The majority of flooring manufacturers can meet these threshold limits. Flooring represents the largest indoor surface in the project. This credit should be achieved as it will have significant impact on visitor and employee health, productivity and comfort.

Wastewater/Water

1. The DEIR should include a discussion of the continued coordination with the Boston Water and Sewer Commission (BWSC) to allow for capacity analysis of the downstream sewer system to be performed once those flows are further refined. **BOS 17**

2. If the water and/or wastewater estimates exceed 300,000 gallons per day (gpd), the DEIR should include an analysis of potential GHG emissions related to the treatment and conveyance of wastewater or withdrawal, treatment and conveyance of potable and/or non-potable water. **BOS 18**

3. In the table on page 3 of the ENF Form, the "Change" in "Water Use" and "Water Withdrawal" should be 395,610 gpd (difference between total of 435,810 gpd and 40,200 gpd existing). **BOS 19**

4. The DEIR should address whether there is potential for an increase in the "existing" irrigation or O&M water use based on the overall growth and increase in use proposed at the site. These existing flows are carried forward into the proposed future condition. **BOS 20**

5. The DEIR should clarify whether peak water demands have been factored into the capacity analysis of the existing system. **BOS 21**

6. For existing sewers on the site that are not proposed to be replaced, the proponent should perform a condition assessment to evaluate infiltration/inflow (I/I) and remove I/I as necessary, including separation of inflow sources throughout the site. **BOS 22**

7. The DEIR should include a discussion of I/I mitigation that will be required as part of the BWSC site plan approval process. Note that I/I removal associated with the proposed project will need to be performed in the sewer system downstream of the site and that impacts associated with that work should be considered and addressed. **BOS 23**

8. At the March 6 MEPA consultation session, an East Boston resident reported existing low water pressure in the area. The DEIR should examine the effects of project and cumulative demand on the water supply and delivery system in the area, and identify any constraints and mitigation. **BOS 24**

9. At the March 6 MEPA consultation session, the proponent described rainwater harvesting as possibly displacing water demand for the Central Utility Plant, track maintenance and irrigation. We suggest that the DEIR quantify this benefit. **BOS 25**

Stormwater

1. We are encouraged by the proponent's statements at the March 6 MEPA consultation session about decreasing impervious surfaces and we look forward to additional detail in the DEIR. **BOS 26**

2. While the ENF states that the proposed drainage system will significantly improve the quality of stormwater that discharges to Sales Creek, the means to achieve this goal should be fully described in the DEIR. **BOS 27**

3. Greater description of the stormwater management system for the CAFO is needed in the DEIR to document compliance with the Massachusetts Stormwater Management Regulations, as this is land use with higher potential pollutant loads. **BOS 28**

4. At the March 6 MEPA consultation session, the proponent mentioned the possible use of on-site wetlands for the treatment of stormwater. We look forward to evaluation of this approach in the DEIR. **BOS 29**

Historical Resources

1. We are encouraged by the proponent's statements at the March 6, 2013 MEPA consultation session that the site and building design will be inspired by the history of the site. The ENF includes an inventory of historic and archaeological resources in the project area identified through the National and State Registers. The DEIR should build on this information and provide detail on historic preservation activities and any impacts to historic resources that may occur. **BOS 30**

Travel Demand Management

While the scope of this letter is limited to environmental concerns, the City's interests and review extend well beyond these issues. As such, a second letter is also being submitted to your office by the City commenting on transportation elements of the project's anticipated environmental impacts. *See Attachment A: March 26, 2013 City of Boston Transportation Department Letter.* The following are some comments in addition to that Department's comments on TDM.

1. The ENF states that "the TDM proposals associated with the project are expected to go beyond traditional TDM concepts to include a multi-modal transportation plan." TDM needs should be thoroughly addressed in the DEIR, with much more focus on non-motorized transportation options. **BOS 31**

2. The ENF shows that there is little in the way of bicycle infrastructure north of Suffolk Downs in Revere. The City of Revere, working with the Metropolitan Area Planning Commission (MAPC), is in the early stages of developing a bicycle plan (http://mapc.org/resources/bike-transport). The DEIR should provide more detail on the recommended plan. It should also address the condition of current bicycle and pedestrian network in the DEIR, particularly connection points with proposed improvements. The DEIR should contain an analysis of pedestrian connectivity through the site to the access points presented at the March 6, 2013 MEPA consultation session. **BOS 32**

3. The level of service (LOS) analysis should include the development of existing and future pedestrian and bicycle level of service along major corridors and districts adjacent to the site, as well as to transit stops and stations in the vicinity. **BOS 33**

4. The ENF does discuss the possibility of using water transportation to alleviate roadway congestion, which the City of Boston is assessing and encourages. The City is requesting the proponent look at how the project can tie in to the water transportation network to downtown Boston and the Boston Harbor Islands national park. In addition to considering water transport during casino operations, the City has asked the proponent to evaluate the possibility of using water transport during project construction for construction materials and construction workers. **BOS 34**

Alternatives

1. An alternative that involves development of a similar area should be evaluated in the DEIR, as well as any other alternatives, similar to the DEIR scope requirements in the Secretary's Certificate on the Project First Light-Destination Resort Casino. **BOS 35**

Air Quality

1. It is unclear whether Transportation Conformity will be required. Although the proponent states that roadway improvements will not be federally funded or sponsored, if FHWA approval is required for proposed improvements to Routes 1 or 1A, a Transportation Conformity analysis should be included in the DEIR. **BOS 36**

2. The ENF states that a microscale (local) intersection analysis, as required by the BRA, will be conducted. The City and/or BRA will also review a carbon monoxide (CO) impact analysis for 1) intersection most affected by the proposed project, and 2) the "worst" intersection in the study area, based on traffic volume and level of service, determined in accordance with U.S. EPA CO hot spot modeling guidance. This analysis would be required if a Transportation Conformity analysis is required. The cumulative induced traffic impacts of the proposed project in an already congested ozone nonattainment area are important. We agree with the proponent that a detailed analysis of the associated effects on local air quality should be included in the DEIR. **BOS 37**

3. The proponent states that a mesoscale (regional) air quality impact analysis will be conducted in the DEIR "in accordance with triggers set forth by the MEPA regulations and/or the BRA." Both the Build Year traffic impacts and Horizon Year induced growth traffic impacts are expected to be significant in an already congested Route 1 corridor. The effects of this traffic on regional air pollutant emissions and concentrations, and on consistency with the MA State Implementation Plan, should be considered in the DEIR, whether or not the specific triggers are exceeded. **BOS 38**

4. The possibility of dust impacts due to site grading and fill placement is not included in the ENF and should be quantified and evaluated for mitigation in the DEIR. **BOS 39**

5. The DEIR should review the locations of all on-site air emissions sources, such as the CUP stack, idling buses, and engine generators, with respect to adjacent neighborhoods, and site these to minimize potential air quality impacts. For idling buses, the DEIR should reference local and state anti-idling ordinances and regulations, and discuss how enforcement will be managed by the proponent as part of mitigation. **BOS 40**

6. The ENF states that the size of the boilers, generators and other combustion units in the proposed CUP have not been determined, and will not be determined until final design. The DEIR should include a worst-case upper bound estimate of the proposed project's onsite combustion equipment, along with estimates of both air pollutant and greenhouse gas emissions from this equipment. **BOS 41**

7. MassDEP and MEPA encourage all major construction projects to meet requirements for diesel construction equipment in the MassDEP State Revolving Fund (SRF) requirements (http://www.mass.gov/dep/water/ wastewater/diesel.htm). These require that all non-road diesel equipment rated 50 horsepower or greater that will be used on a project site meet EPA's Tier 4 emission limits or be retrofitted with appropriate emission reduction equipment. Emission reduction equipment includes EPA-verified, CARB verified or DEP-approved diesel oxidation catalysts or diesel particulate filters. This should be addressed in the DEIR. **BOS 42**

8. The DEIR should include a discussion of regional air quality and public health. The project study area includes a concentration of major transportation sources - highways, Logan Airport, and port and rail activities. Since the proposed project could add to regional air **BOS 43**

pollutant emissions through increased traffic and induced growth, possible resulting effects on regional air quality and public health should be considered in the DEIR. This should include references to ongoing MA Department of Public Health and Massport studies of air quality and public health in East Boston neighborhoods.

Construction and Demolition Debris

1. Organic deposits that provide a potential source for methane generation are presumably below the groundwater table. Although the groundwater table depth does affect the potential for methane generation and migration, it does not eliminate the potential for methane migration; therefore this potential issue should be addressed in the DEIR. Sampling and analysis of driven vapor points to measure soil gas is an appropriate investigation measure. **BOS 44**

Construction Management

1. The DEIR should discuss why transportation improvements are starting four months after project construction begins. **BOS 45**

2. Substantial site grading and soil movement will likely be necessary at the site to achieve adequate flood protection, stormwater retention and landscaping. We suggest that the DEIR include a soils balance, quantifying how much material will be moved, imported, and exported from the site. The geotechnical section of the ENF states that the proponent intends to keep soils on-site to the extent possible, and that currently the project includes just one level of below-grade parking. We support this approach. **BOS 46**

3. The DEIR should specify whether construction materials will be conveyed to the site via water transportation. **BOS 47**

4. Each of the following aspects of Suffolk Downs ongoing operation should be addressed in the Construction Management Plan, which should be included in the DEIR: **BOS 48**

   - Race track operations
   - Safety – pedestrian and vehicular movement
   - Access – which areas will be closed off due to construction activities
   - Staging areas
   - Worker parking
   - Noise
   - Dust

Construction Noise

1. Demolition/construction-period noise is subject to the Regulations for the Control of Noise in the City of Boston (http://www.cityofboston.gov/Images_Documents/noise_reg_tcm3- **BOS 49**

13127.pdf), implemented by the Boston Air Pollution Control Commission (APCC), a division of the Boston Environment Department. Please see Regulation 3, Restrictions – Construction Sites.

2. Best Available Control Technologies (BACT) and other best management practices (BMP) should be employed at the project site to minimize noise impacts. Measures should include: **BOS 50**
   a. Securing any decking on roadways so that there is no rattling when traffic passes over;
   b. Using vehicles and equipment with either ambient-sensitive or manually adjustable back-up alarms;
   c. Proper sizing of impact equipment such as hoe rams, pile drivers and jackhammers and powering only to the degree needed to perform the work;
   d. Installation of noise suppression enclosures on hoe rams;
   e. Placement of stationary noise producing equipment such as pumps and generators as far away as possible from residential and sensitive receptor locations; and
   f. Keeping engine housing panels on all equipment closed; and when not in use, shutting off equipment.

Construction Air Quality

1. All pre-2007 diesel construction vehicles working on the project should be retrofitted using retrofit technologies approved by the United States Environmental Protection Agency (EPA) and that ultra-low-sulfur diesel (ULSD) fuel (15 ppm) be used for all off-road diesel equipment. **BOS 51**

2. A plan should be put in place to ensure compliance with the Commonwealth of Massachusetts Department of Public Health, Division of Environmental Health, Bureau of Air Quality Control Regulations for the Control of Air Pollution Regulation 11 – Transportation Media (MGL 90 s16A, 310 CMR 7.11). **BOS 52**

3. An enforceable anti-idlng plan should be developed for the project site, the project area and for any vehicle layover/marshaling areas. The plan should be included in the DPIR. **BOS 53**

4. In order to minimize the spread of dust and debris, it is suggested to lay one to two inches of gravel no less than ten (10) feet in length at truck entrances and egresses in addition to a wheel wash, with proper provisions for runoff. The use of the wheel wash is needed. **BOS 54**

5. Regular vacuum cleaning of streets and sidewalks in the project area should be employed to ensure that they remain free streets of dust and debris. The use of a vacuum sweeper is an important measure for preventing construction-related dust and debris from being transported by air or deposited in storm drains. **BOS 55**

6. To the greatest extent possible, aggregate piles and excavated materials should not be allowed to remain on the site overnight and on weekends or holidays. Means to ensure that materials will not blow off site should be identified. **BOS 56**

Chemical Cleaning and Abrasive Blasting

1. If work at the site will include interior or exterior abrasive blasting or chemical cleaning, a permit must first be obtained from the APCC. **BOS 57**

Contaminated Materials and Hazardous Waste Considerations

1. The Environmental Site Assessment (ESA) referenced in the ENF notes that the Method 3 Risk Characterization supporting the site Response Action Outcome excluded contaminants associated with background conditions and that a Health and Safety Plan for protection of construction workers and a Soil Management Plan for management and disposal of site soils would be prudent for any future site development. These should be provided in the DEIR. **BOS 58**

2. The DEIR should consider the regulatory requirements included in the MassDEP policy regarding Construction of Buildings in Contaminated Areas. **BOS 59**

3. The ENF text on Non-Structural Controls mentions that onsite storage of hazardous materials or toxic chemicals during construction will be limited to what is absolutely necessary. Additional details regarding the nature of these materials should be provided in the DEIR, as well as spill prevention and control procedures, especially for construction equipment and vehicles. **BOS 60**

4. The ENF text on Dewatering notes that dewatering discharges will be infiltrated into the ground where possible. This may be difficult due to the shallow groundwater table at the site as well as the potential for contamination as noted in the ESA. The DEIR should include: **BOS 61**

   - Locations where significant dewatering efforts are anticipated such as the parking garage
   - Best management practices/groundwater treatment options and disposal locations
   - Applicable regulatory requirements

5. Contaminated material management issues that are likely to be encountered during project construction and should be addressed in the DEIR include: **BOS 62**

   - Above ground storage tanks
   - Underground storage tanks
   - Existing hazardous materials in the maintenance garage

- Polychlorinated biphenyls (PCBs) – management and disposal of PCB contaminated materials including building materials (e.g. window caulking) and electrical transformers

Noise

1. We are pleased to see that the proponent has agreed to address operational noise for stationary and traffic sources, and to evaluate the effects of this new 24-hour activity on bordering residential areas. The ENF states that based on a review of hourly traffic data over a 24-hour period, the proponent will conduct noise impact analysis for two scenarios, a daytime off-peak hour and a nighttime hour. In the DEIR, 24-hour casino equipment and operational noise, and not just traffic noise, should be used in selecting these scenarios. At a minimum, the two scenarios should be: 1) hour of greatest increase over existing background monitored noise level; and 2) hour of highest combined total noise impact. If neither of these occurs during a nighttime hour, a nighttime hour should be added to assess sleep disturbance impact. A better and more informative analysis would also include a complete hour-by-hour 24-hour noise profile of the facility at build-out. **BOS 63**

2. The ENF states that a baseline sound level monitoring program will be conducted in and around residential neighborhoods to the north, east and south of the project site. The DEIR should include the results of 24-hour monitoring for a representative weekday and weekend day at potentially affected sensitive receptor locations in these neighborhoods. Potentially affected sensitive receptors could be those near the project site, near traffic noise sources, and those farther away, but with direct line of site to the proposed facility. **BOS 64**

3. The proposed Boardman Street fly-over and increased bus activity in the Suffolk Downs parking areas should be included as possible new noise sources in the DEIR noise assessment. **BOS 65**

4. The DEIR should include construction noise impact modeling and not be limited to a generic discussion of mitigation measures. Since the construction period will be 30 months or more adjacent to residential areas, the modeling could inform specific mitigation measures related to activity siting, enclosures, and specifications for equipment muffling. **BOS 66**

5. The ENF states that noise impact will be evaluated based on City of Boston noise regulations and Federal Highway Administration (FHWA) Noise Abatement Criteria. The DEIR should also compare project equipment noise levels to MassDEP sound level criteria, and compare total modeled combined noise impacts (equipment, idling buses, other site activity, and increased traffic) at nearby residential sensitive receptors to EPA and HUD day-night residential noise impact criteria. **BOS 67**

Operational Solid and Hazardous Wastes

1. The ENF does not mention any additional protection to prevent exposure to adjacent tank farms or the onsite landfill in a flooding event. A review of the adequacy of existing protection should be included in the DEIR. **BOS 68**

2. The DEIR should describe how and where potentially hazardous materials will be stored on the site. **BOS 69**

3. The DEIR should include a detailed discussion of post-construction solid waste management and recycling, as well as abatement of asbestos containing materials and lead based paint. The ENF states that the proponent is committed to studying anaerobic digestion for both solid organic waste diversion and for on-site energy production. We support this approach, and encourage the proponent to commit to implementation, as well. **BOS 70**

Socioeconomics and Environmental Justice

1. The City is interested in reviewing socioeconomic studies related to induced growth and community impacts, including those referenced in MEPA regulations. **BOS 71**

2. Pursuant to the Environmental Justice Policy of the Executive Office of Environmental Affairs this project is within an environmental justice population (see paragraphs 14 and 15 of the Policy). The scope of the DEIR should include provisions to comply with this policy. **BOS 72**

Land Use

1. The DEIR should include discussion of current land use and character of adjacent areas (within a defined study area) to assess compatibility and visual character. **BOS 73**

2. The DEIR should describe in greater detail how the massing and building heights within the project will compare to surrounding neighborhood. **BOS 74**

Wetlands

1. The ENF presents very general information about wetland impacts and mitigation, although we are encouraged by the new landscaping information provided at the March 6 MEPA consultation session, which indicates that portions of the site will be returned to their natural state as wetland. We look forward to reviewing more detailed information in the DEIR. **BOS 75**

2. The ENF indicates that there will be approximately 480,000 square feet of filling within bordering land subject to flooding and that compensatory storage will be provided. The DEIR should provide the locations and plans for providing required flood storage. **BOS 76**

Thank you again for this opportunity. Please let us know if you have questions or comments.

Very truly yours,

Brian Swett
City of Boston
Chief of Environment and Energy

A. City of Boston Transportation Department Comment Letter

CITY OF BOSTON – ENVIRONMENTAL AND ENERGY SERVICES (BOS)

BOS 01 **Below is a list of overarching policies and goals that the City recommends the Proponent consider:**

- **Reduce energy intensity to the maximum extent possible;**
- **On-site alternative energy generation to the maximum extent possible;**
- **Strive to achieve LEED Platinum status;**
- **Conserve, maximize efficiency and reuse water to the greatest extent possible;**
- **Seek innovative green attributes;**
- **Maximize TDM opportunities for all guests and staff; and**
- **Create a standard for sustainable resort operations and maintenance.**

The Proponent has been dedicated to designing a world-class destination resort that incorporates a variety of sustainable design elements and "green" features. Section 2.0 describes the process and results from this commitment to being green.

BOS 02 **The Proponent presented some new design and sustainability concepts at the March 6, 2013 MEPA consultation session that are not reflected in the ENF filed on January 31, stating that the Project will connect nature, people and place and that it will be the "greenest" casino in the country. We are encouraged by Suffolk Downs' pledges for a particularly green development, including new plans to reduce pavement by 30% and transform current asphalt into a more natural landscape. We expect that the DEIR will describe these general comments in more detail.**

Section 2.0 describes the Proponent's commitment to designing, constructing, and operating a LEED Gold "green" Project. As described in Section 4.4, the Project will reduce impervious surfaces and increase open space on the Project site relative to existing conditions.

BOS 03 **The ENF cites 2017 as the Build Year and 2020 as the Horizon Year. We suggest that the final Horizon Year be selected with MEPA, MassDOT, and MassDEP input (for State Implementation Plan target years), and that it be a year that represents full operation of the Project plus reasonably foreseeable growth induced by the Project.**

As required by MassDOT, the DEIR/EPNF traffic analysis horizon year is 2022. For Route 1A infrastructure improvement alternatives, a design year 2032 analysis is included.

BOS 04 **The study area for each topic in the DEIR should be clearly specified and justified.**

The study areas for all analyses are defined in respective sections of the DEIR/EPNF.

BOS 05 **Impacts of proposed mitigation, as well as direct and indirect effects, and cumulative effects should be addressed in the DEIR.**

Potential environmental impacts are described in Section 6.0, and transportation is addressed in Section 5.0.

BOS 06 **The DEIR should include a description of plans for renovating the existing racetrack and plans during and after construction. Any intensification of use of the racetrack facilities over existing conditions as induced by increased visitors to the casino should also be identified and included in the impact analysis.**

If the Proponent receives a Category 1 gaming license and the Project moves forward, the track will continue to operate as it does today; no modifications to the racetrack are planned as part of this Project. Assuming Project completion, intensification of track activity is likely to occur around special events.

BOS 07 **We encourage the Proponent's commitment to renewable energy, and look forward to a more detailed analysis and description in the DEIR of [anaerobic digestion, solar PV, and geothermal energy] and other innovative technologies including:**

- **Anaerobic digestion using wastewater sludge, horse manure, food waste and other nearby organic wastes to produce biogas for use in CHP systems or to produce biofuels for on-site vehicle use;**
- **CHP systems using natural gas and/or digester gas (engine generators, microturbines, fuel cells, etc.);**
- **Solar PV (including power purchase agreements);**
- **Solar thermal;**
- **Building-integrated solar;**
- **Wind turbines;**
- **Low-impact hydroturbines;**
- **Geothermal;**
- **Water source heat pumps;**
- **Sewer heat recovery;**
- **Biofuels;**

- Biomass boilers; and
- Purchasing green power.

These technologies and strategies are addressed in the GHG analysis in Section 7.0.

BOS 08 **The ENF states that both Boston and Revere are Energy Stretch Code communities, requiring high standards for efficient energy use in buildings. The ENF then states that these standards will be included in the "preferred case," but not in the "baseline case" that would be used as comparison. The DEIR should examine Stretch Code requirements in the "baseline case," along with reasonable energy conservation measures that would be encouraged for any new development at the site, and then show how this Project may go beyond these measures.**

The MEPA GHG Emissions Policy and Protocol requires that the baseline case (for stationary sources) reflect a building designed to meet the current Massachusetts Building Code. Mitigation measures adopted to achieve or exceed the Stretch Code are included in the Preferred case. Section 7.0 describes all mitigation measures incorporated into the Project design and demonstrates that the resulting Project will go well beyond the requirements of the Stretch Code.

BOS 09 **In design review, the City will look for protection for the community in relation to sea level rise and storm surge. The ENF used the historic sea level rise value of 2.65 mm/yr. The ENF assumes a linear progression of sea level rise over the 100-year period, which does not account for the potential for future acceleration in the rate of sea level rise. The ENF also states that sea level rise would be 10.44 inches over the next century. The EEA Climate Change Adaptation Report suggests a more conservative sea level rise change, taking uncertainty associated with the United Nations IPCC models into account, of 1 to 6 feet by the end of the century.**

The Project design comprehensively accommodates sea level rise. The 100-year floodplain elevation on the site is at elevation 15.46 feet (BCB), and MHHW is elevation 10.44 feet. Consistent with TBHA's sea level rise analysis, the Project team applied a sea level rise of 7.5 feet to MHHW to obtain a sea level rise "mitigation elevation" of 18.7 feet, and has located proposed buildings, the entrance road, and critical infrastructure above this elevation to provide resiliency to sea level rise (see Section 2.3).

BOS 10 **The ENF looked at the relationship of the first floor elevation to flood elevation. It is more appropriate to compare the ground floor to flood levels, allowing for the protection of all critical infrastructure. The Proponent has agreed to consider both the ground floor and critical infrastructure for vulnerability to flooding in the DEIR. We recommend the Proponent also consider protection of chemicals, manure, and other potential pollutants from a flooding event.**

Please see the response to BOS 09. The ground-floor elevation of the parking garage will be at elevation 16.4 feet; therefore, it is anticipated that this area may experience flooding during extreme storm events. The facility will have procedures in place to evacuate vehicles if necessary. CAFO operations will remain at current elevations. Section 2.3 addresses climate change and adaptation.

BOS 11 **The DEIR should evaluate the floodplain, including the Flood Insurance Rate Maps, the 100-year floodplain in the Project area, and coastal storm flood issues. If necessary under storm surge conditions, we also suggest that the DEIR evaluate a potential operation of a pumping station.**

The Proponent has evaluated the 10-year floodplain in the Project area and has located all first-floor elevations, access roads, and critical infrastructure above anticipated sea level rise elevations based on conservative assumptions (see Section 2.3).

BOS 12 **310 CMR 10.57(4) states that the compensatory storage shall have an unrestricted hydraulic connection to the adjacent water body, meaning that the proposed development plans need to be examined to confirm that existing flow paths are not severed, which can result in localized flooding. This issue should be addressed in the DEIR.**

The Project has been designed to result in no net filling of floodplain. Work will be performed within the floodplain, including filling and cutting activities. All floodplain areas will be hydraulically connected to Sales Creek and other wetlands to prevent isolated ponding of water (see Section 2.3 for a discussion of climate change and adaptation). Information demonstrating compliance with the referenced performance standard is provided in Section 6.9.

BOS 13 **The DEIR should also consider and evaluate the impacts on flooding of adjacent sites as it may impact the proposed site.**

The Project will reduce impervious surface on the site, thereby decreasing stormwater flows leaving the site. All stormwater generated by the site will be collected, treated, and ultimately discharged to either Sales Creek or on-site wetlands systems. There will be no direct discharges to adjacent properties (see Section 9.3). Information demonstrating compliance with the BLSF performance standard is provided in Section 6.9.

BOS 14 **At the March 6 MEPA consultation session, the Proponent stated its intent to make the Project the "greenest" casino in the country, yet the ENF indicates that the Project will strive for LEED Gold, which is required in the Expanded Gaming Law... The DEIR should describe in detail how the Project will be certified as LEED Gold or higher.**

Attachment E includes a summary LEED NC 2009 scorecard demonstrating the Proponent's commitment to achieving LEED Gold Certification and a detailed analysis of the LEED NC 2009 prerequisites and credits the Project is targeting for achievement.

BOS 15 Sustainable strategies should not be limited to or by LEED credit thresholds and certification. The DEIR should include consideration of alternative rating systems and metrics that may provide measurable long-term benefits to the Project.

Additional rating systems and metrics are described in Section 2.2.7.

BOS 16 It appears that the LEED scorecard in the ENF needs to be updated in the DEIR to reflect the Proponent's additional sustainability commitments as presented at the March 6 MEPA consultation session. We offer the following comments on the ENF scorecard to assist the Proponent in making revisions:

- The ENF indicates that the Project will be LEED Gold certifiable (60-79 points); however, the scorecard indicates a total of 58 points. Typically projects attempt several "extra" credits in case USGBC rejects, or the project misses on, any given credit. This is a minimal effort for LEED certification with most credits coming from non-Energy/Water credits…
- LEED Scorecard breakdown:
  - Only minimal points are attempted in the Energy and Atmosphere category with no points for On-site Renewable Energy even though the project description mentions possible PV installation. The ENF indicates an on-going investigation with regard to installing solar arrays. These may provide the "visual" sustainable image desired by the City of Boston but may not provide enough power to make a significant impact on the project's energy consumption or meet the LEED threshold for credit compliance.
  - Only minimal points are attempted in Water Efficiency with no points in Wastewater Technologies.
  - Sustainable Sites Credit 8 Light Pollution Reduction is not attempted. While it may be difficult for this type of project to achieve the LEED threshold for this credit, there should be some discussion on the strategy to limit light trespass into the adjacent residential neighborhoods.
  - Only minimal points are attempted in Materials and Resources.
  - Less than half of the Indoor Environmental Quality (IEQ) credits are attempted. The ENF indicates that the Project will not meet IEQ credit for low-emitting flooring systems. The majority of flooring manufacturers can meet these threshold limits. Flooring represents

the largest indoor surface in the Project. This credit should be achieved as it will have significant impact on visitor and employee health, productivity and comfort.

Attachment E includes a summary LEED NC 2009 scorecard demonstrating the Proponent's commitment to achieving LEED Gold Certification and a detailed analysis of the LEED NC 2009 prerequisites and credits the Project is targeting for achievement.

The Project design includes installation of a significant PV array that will provide approximately 10% of the Resort's estimated annual energy use. Regarding water and wastewater efficiencies, the Proponent is striving to reduce potable water use for sewage conveyance, including measures such as waterless urinals and ultra-low-flow metered lavatory faucets.

Efforts to minimize potential light pollution are described in Sections 2.0 and 4.4.

In terms of materials and resources, the Proponent intends to specify the use of products and materials with recycled content and those that are extracted, harvested, or manufactured regionally.

For indoor environmental quality, the Proponent is attempting 11 of the 15 available credits, including the credit for low-emitting flooring systems. The Proponent intends that standard flooring materials will met the CRI Green Label Plus and Floorscore criteria as required for IEQc4.3, Low Emitting Materials, Flooring Systems. However, it should be noted that some carpets planned for installation in the gaming areas will be custom-fabricated, and may not meet specific CRI Green Label Plus requirements.

BOS 17 The DEIR should include a discussion of the continued coordination with the BWSC to allow for capacity analysis of the downstream sewer system to be performed once those flows are further refined.

The Proponent continues to coordinate with the BWSC regarding wastewater discharges as well as any mitigation that may be required (see Section 9.1).

BOS 18 If the water and/or wastewater estimates exceed 300,000 gpd, the DEIR should include an analysis of potential GHG emissions related to the treatment and conveyance of wastewater or withdrawal, treatment and conveyance of potable and/or non-potable water.

The GHG analysis in Section 7.0 does incorporate water and wastewater volumes.

BOS 19 **In the table on page 3 of the ENF Form, the "Change" in "Water Use" and "Water Withdrawal" should be 395,610 gpd (difference between total of 435,810 gpd and 40,200 gpd existing).**

The Proponent agrees with this statement.

BOS 20 **The DEIR should address whether there is potential for an increase in the "existing" irrigation or O&M water use based on the overall growth and increase in use proposed at the site.**

Water use for track watering and operations in the stable area is expected to remain consistent with past water use figures. Irrigation flows for landscaped areas will increase since the Project site will contain more green space and landscaped areas than it does under existing conditions; however, water-efficient plantings will be used to minimize this increase in landscape irrigation water use.

BOS 21 **The DEIR should clarify whether peak water demands have been factored into the capacity analysis of the existing system.**

Water demands expressed in the ENF were based on Title V flow factors, which include a daily peak factor. Additional hourly peaking estimates are being developed to estimate peak flows that will be discharged to the City sewer system (see Section 9.1).

BOS 22 **For existing sewers on the site that are not proposed to be replaced, the Proponent should perform a condition assessment to evaluate I/I and remove I/I as necessary, including separation of inflow sources throughout the site.**

The Project will not use any existing sewer lines on the Project site. All sanitary sewer lines serving the Resort will be newly-constructed.

BOS 23 **The DEIR should include a discussion of I/I mitigation that will be required as part of the BWSC site plan approval process. Note that I/I removal associated with the proposed Project will need to be performed in the sewer system downstream of the site and that impacts associated with that work should be considered and addressed.**

The Proponent is continuing to coordinate with BWSC and MWRA to provide adequate mitigation for the Project (see Section 9.1).

BOS 24 **At the March 6 MEPA consultation session, an East Boston resident reported existing low water pressure in the area. The DEIR should examine the effects of Project and cumulative demand on the water supply and delivery system in the area, and identify any constraints and mitigation.**

The Proponent is continuing to coordinate with BWSC and MWRA to provide adequate mitigation for the Project. Water testing was performed on Waldemar Avenue on June 29, 2012 to measure water pressure in the area; results indicated that adequate pressure exists in the site vicinity to provide service to the Resort, and a booster pump will be used to ensure that Hotel I has adequate water pressure.

BOS 25 **At the March 6 MEPA consultation session, the Proponent described rainwater harvesting as possibly displacing water demand for the CUP, track maintenance and irrigation. We suggest that the DEIR quantify this benefit.**

The Project design includes three large rainwater reuse tanks that will collect stormwater generated by building roofs. This water will be used for on-site irrigation of landscaped areas, track watering, and cooling tower water, which will save approximately 4.5 million gallons of water per year (see Section 9.0).

BOS 26 **We are encouraged by the Proponent's statements at the March 6 MEPA consultation session about decreasing impervious surfaces and we look forward to additional detail in the DEIR.**

The Project will decrease impervious surfaces on the site by approximately 14 acres relative to existing conditions (see Section 1.0). Section 4.0 describes impervious area and open space in the context of site design.

BOS 27 **While the ENF states that the proposed drainage system will significantly improve the quality of stormwater that discharges to Sales creek, the means to achieve this goal should be fully described in the DEIR.**

The Project will not increase the flow of stormwater off-site, and the Project will reduce impervious area on site; therefore, total stormwater generated by the site will decrease relative to existing conditions. A series of BMPs are included as part of the stormwater management system to improve the quality and reduce the quantity of stormwater flowing from the site. These measures include bioretention basins, water quality swales, pervious pavers, bioswales, and rainwater reuse tanks (see Section 9.3).

BOS 28 **Greater description of the stormwater management system for the CAFO is needed in the DEIR to document compliance with the Massachusetts Stormwater Management Regulations, as this is land use with higher potential pollutant loads.**

Stormwater that falls on the ground in the CAFO area is collected, stored, allows to settle, and ultimately discharged to the BWSC system near the Suffolk Downs MBTA station. Stormwater that falls on stable rooftops is routed to a stormwater drainage system and discharged to Sales Creek. This system was approved by the EPA and Boston Conservation Commission and is compliant with the MassDEP Stormwater

Management Regulations. The Project includes construction of a parking lot in a portion of the CAFO that will effectively reduce the size of the CAFO area by approximately 2.3 acres. Therefore, flows from the CAFO will lessen and flows to the CAFO settling pond and the MWRA system will be reduced (see Section 9.3).

BOS 29 **At the March 6 MEPA consultation session, the Proponent mentioned the possible use of on-site wetlands for the treatment of stormwater. We look forward to evaluation of this approach in the DEIR.**

The Project includes construction of bioretention areas for stormwater treatment as well as construction of floodplain compensation areas; these areas will include wetlands plantings, as appropriate. All stormwater generated on site will be treated prior to discharge to wetland areas surrounding the site (see Section 9.3).

BOS 30 **The ENF includes an inventory of historic and archaeological resources in the Project area identified through the National and State Registers. The DEIR should build on this information and provide detail on historic preservation activities and any impacts to historic resources that may occur.**

An updated MHC Form A was submitted to the MHC and BLC July 1, 2013. A copy of the inventory form is included as Attachment J. Impacts to historic resources are described in Section 8.0.

BOS 31 **The ENF states that "the TDM proposals associated with the Project are expected to go beyond traditional TDM concepts to include a multi-modal transportation plan." TDM needs should be thoroughly addressed in the DEIR, with much more focus on non-motorized transportation options.**

A comprehensive TDM Plan including strategies focused on non-motorized transportation is presented in Section 5.9.

BOS 32 **The ENF shows that there is little in the way of bicycle infrastructure north of Suffolk Downs in Revere. The City of Revere, working with the MAPC, is in the early stages of developing a bicycle plan... The DEIR should provide more detail on the recommended plan. It should also address the condition of current bicycle and pedestrian network in the DEIR, particularly connection points with proposed improvements. The DEIR should contain an analysis of pedestrian connectivity through the site to the access points presented at the March 6, 2013 MEPA consultation session.**

As described in Section 5.8.3, the Proponent has committed to provide new on-street bicycle accommodations in the Bennington Street corridor connecting Constitution Beach, Belle Isle Marsh, and Revere Beach, with spur connections to the Project site. The existing and proposed bicycle facilities are presented in Figure 5-5. Pedestrian connectivity through the Project site is described in Section 1.1.1.5.

BOS 33 **The LOS analysis should include the development of existing and future pedestrian and bicycle LOS along major corridors and districts adjacent to the site, as well as to transit stops and stations in the vicinity.**

Relevant pedestrian and bicycle LOS analysis will be developed in coordination with BTD as part of the FEIR/Final Project Impact Report analysis.

BOS 34 **The ENF does discuss the possibility of using water transportation to alleviate roadway congestion, which the City of Boston is assessing and encourages. The City is requesting the Proponent look at how the Project can tie in to the water transportation network to downtown Boston and the Boston Harbor Islands national park. In addition to considering water transport during casino operations, the City has asked the Proponent to evaluate the possibility of using water transport during Project construction for construction materials and construction workers.**

There are currently no plans to convey construction materials to the site via water transportation. The Proponent supports Mayor Menino's vision to enhance water transportation options to East Boston by instituting regular water shuttle service between the South Boston and East Boston waterfronts. As such, the Boston HCA includes a contribution that will assist the City in establishing this service.

BOS 35 **An alternative that involves development of a similar area should be evaluated in the DEIR, as well as any other alternatives, similar to the DEIR scope requirements in the Secretary's Certificate on the Project First Light – Destination Resort Casino.**

An alternatives analysis is provided in Section 1.9.

BOS 36 **It is unclear whether Transportation Conformity will be required. Although the Proponent states that roadway improvements will not be federally funded or sponsored, if FHWA approval is required for proposed improvements to Routes 1 or 1A, a Transportation Conformity analysis should be included in the DEIR.**

Transportation conformity analysis is not required as there is no federal permitting required for the Project.

BOS 37 **The ENF states that a microscale (local) intersection analysis, as required by the BRA, will be conducted. The City and/or BRA will also review a carbon monoxide (CO) impact analysis for (1) intersection most affected by the proposed Project, and (2) the "worst" intersection in the study area based on traffic volume and LOS,**

determined in accordance with USEPA CO hot spot modeling guidance. This analysis would be required if a Transportation Conformity analysis is required. The cumulative induced traffic impacts of the proposed Project in an already congested ozone nonattainment area are important. We agree with the Proponent that a detailed analysis of the associated effects on local air quality should be included in the DEIR.

The methodology and results of the mesoscale analysis are presented in Sections 6.5.4.1 and 6.5.5.1, respectively.

BOS 38 The Proponent states that a mesoscale (regional) air quality impact analysis will be conducted in the DEIR "in accordance with triggers set forth by the MEPA regulations and/or the BRA." Both the Build Year traffic impacts and Horizon Year induced growth traffic impacts are expected to be significant in an already congested Route 1 corridor. The effects of this traffic on regional air pollutant emissions and concentrations, and on consistency with the MA State Implementation Plan, should be considered in the DEIR, whether or not the specific triggers are exceeded.

The methodology and results of the mesoscale analysis are presented in Sections 6.5.4.1 and 6.5.5.1, respectively.

BOS 39 The possibility of dust impacts due to site grading and fill placement is not included in the ENF and should be quantified and evaluated for mitigation in the DEIR.

Construction-period air quality, including potential dust impacts and measures proposed to mitigate those impacts, is described in the Draft CMP in Attachment L.

BOS 40 The DEIR should review the locations of all on-site air emissions sources, such as the CUP stack, idling buses, and engine generators, with respect to adjacent neighborhoods, and site these to minimize potential air quality impacts. For idling buses, the DEIR should reference local and state anti-idling ordinances and regulations, and discuss how enforcement will be managed by the Proponent as part of mitigation.

The methodology and results of an air quality analysis of stationary sources are presented in Sections 6.5.4.3 and 6.5.5.3, respectively. Anti-idling provisions are addressed in Section 6.5.8.

BOS 41 The ENF states that the size of the boilers, generators and other combustion units in the proposed CUP have not been determined, and will not be determined until final design. The DEIR should include a worst-case upper bound estimate of the proposed Project's onsite combustion equipment, along with estimates of both air pollutant and greenhouse gas emissions from this equipment.

The methodology and results of an air quality analysis of stationary sources are presented in Sections 6.5.4.3 and 6.5.5.3, respectively. A GHG emissions analysis is provided in Section 7.0.

BOS 42 MassDEP and MEPA encourage all major construction projects to meet requirements for diesel construction equipment in the MassDEP State Revolving Fund requirements... These require that all non-road diesel equipment rated 50 horsepower or greater that will be used on a project site meet EPA's Tier 4 emission limits or be retrofitted with appropriate emission reduction equipment. Emission reduction equipment includes EPA-verified, CARB verified, or DEP-approved diesel oxidation catalysts or diesel particulate filters. This should be addressed in the DEIR.

Construction air quality mitigation measures are presented in the Draft CMP in Attachment L.

BOS 43 The DEIR should include a discussion of regional air quality and public health. The Project study area includes a concentration of major transportation sources – highways, Logan Airport, and port and rail activities. Since the proposed Project could add to regional air pollutant emissions through increased traffic and induced growth, possible resulting effects on regional air quality and public health should be considered in the DEIR. This should include references to ongoing MA Department of Public Health and Massport studies of air quality and public health in East Boston neighborhoods.

Regional air quality is discussed in Section 6.5.3.

BOS 44 Organic deposits that provide a potential source for methane generation are presumably below the groundwater table. Although the groundwater table depth does affect the potential for methane generation and migration, it does not eliminate the potential for methane migration; therefore this potential issue should be addressed in the DEIR. Sampling and analysis of driven vapor points to measure soil gas is an appropriate investigation measure.

Potential vapor intrusion is discussed in Section 6.11.4.

BOS 45 The DEIR should discuss why transportation improvements are starting four months after Project construction begins.

The Proponent intends to start construction of transportation improvements simultaneously with, or very close to, commencement of Project construction.

BOS 46 Substantial site grading and soil movement will likely be necessary at the site to achieve adequate flood protection, stormwater retention and landscaping. We suggest that the DEIR include a soils balance, quantifying how much material will

be moved, imported, and exported from the site. The geotechnical section of the ENF states that the Proponent intends to keep soils on-site to the extent possible, and that currently the Project includes just one level of below-grade parking. We support this approach.

Site grading will consist of cutting and filling, as described in Section 2.3.5. The Proponent intends to limit the amount of soil brought onto the site or removed from the site to the maximum extent practicable.

BOS 47 The DEIR should specify whether construction materials will be conveyed to the site via water transportation.

There are currently no plans to convey construction materials to the site via water transportation.

BOS 48 Each of the following aspects of Suffolk Downs ongoing operation should be addressed in the CMP, which should be included in the DEIR:

- Racetrack operations
- Safety – pedestrian and vehicular movement
- Access – which areas will be closed off due to construction activities
- Staging areas
- Worker parking
- Noise
- Dust

The Draft CMP in Attachment L addresses each of these items.

BOS 49 Demolition/construction-period noise is subject to the Regulations for the Control of Noise in the City of Boston… implemented by the Boston Air Pollution Control Commission (APCC), a division of the Boston Environment Department. Please see Regulation 3, Restrictions – Construction Sites.

Construction noise impacts from the Project have been evaluated against Regulation 3 noise limits, and results of the analysis are discussed in Section 6.6.4.3.

BOS 50 Best Available Control Technologies (BACT) and other BMPs should be employed at the Project site to minimize noise impacts. Measures should include:

- Securing any decking on roadways so there is no rattling when traffic passes over;
- Using vehicles and equipment with either ambient-sensitive or manually adjustable back-up alarms;

- Proper sizing of impact equipment such as hoe rams, pile drivers and jackhammers and powering only to the degree needed to perform the work;
- Installation of noise suppression enclosures on hoe rams;
- Placement of stationary noise producing equipment such as pumps and generators as far away as possible from residential and sensitive receptor locations; and
- Keeping engine housing panels on all equipment closed, and when not in use, shutting off equipment.

Construction-period noise mitigation is discussed in the Draft CMP in Attachment L.

BOS 51 All pre-2007 diesel construction vehicles working on the Project should be retrofitted using retrofit technologies approved by the EPA and that ultra-low-sulfur diesel (ULSD) fuel (15 ppm) be used for all off-road diesel equipment.

Construction air quality, including diesel emissions, is addressed in the Draft CMP in Attachment L.

BOS 52 A plan should be put in place to ensure compliance with the Commonwealth of Massachusetts Department of Public Health, Division of Environmental Health, Bureau of Air Quality Control Regulations for the Control of Air Pollution Regulation 11 – Transportation Media (MGL 90 s16A, 310 CMR 7.11).

Anti-idling provisions are described in Section 6.5.8.

BOS 53 An enforceable anti-idling plan should be developed for the Project site, the Project area, and for any vehicle layover/marshaling area. The plan should be included in the DEIR.

Construction-period air quality, including idling, is addressed in the Draft CMP in Attachment L.

BOS 54 To minimize the spread of dust and debris, it is suggested to lay one to two inches of gravel no less than ten (10) feet in length at truck entrances and egresses in addition to a wheel wash, with proper provisions for runoff. The use of the wheel wash is needed.

Construction-period air quality mitigation, including dust control measures, is identified in the Draft CMP in Attachment L.

BOS 55 Regular vacuum cleaning of streets and sidewalks in the Project area should be employed to ensure that they remain free of dust and debris. The use of a vacuum sweeper is an important measure for preventing construction-related dust and debris from being transported by air or deposited in storm drains.

Construction-period air quality mitigation, including dust control measures, is identified in the Draft CMP in Attachment L.

BOS 56 **To the greatest extent possible, aggregate piles and excavated materials should not be allowed to remain on the site overnight and on weekends or holidays. Means to ensure that materials will not blow off site should be identified.**

Construction-period air quality mitigation, including dust control measures and materials management, is identified in the Draft CMP in Attachment L.

BOS 57 **If work at the site will include interior or exterior abrasive blasting or chemical cleaning, a permit must first be obtained from the APCC.**

The Proponent acknowledges this requirement and will comply.

BOS 58 **The Environmental Site Assessment (ESA) referenced in the ENF notes that the Method 3 Risk Characterization supporting the site Response Action Outcome excluded contaminants associated with background conditions and that a Health and Safety Plan for protection of construction workers and a Soil Management Plan for management and disposal of site soils would be prudent for any future site development. These should be provided in the DEIR.**

Project health and safety plans to protect worker safety will be created prior to construction and will be included as part of the Contract Documents. Health and safety plans will be detailed documents tailored to meet the specific needs of the Project site and will include practices intended to protect workers consistent with appropriate Occupational Safety and Health Administration (OSHA) and regulatory requirements. It is not standard practice, nor is it feasible, to prepare health and safety plans relating to workplace safety at this stage of Project planning. The Proponent intends to reuse all excavated soils on-site. If excess soils are generated, they will be sampled and tested consistent with standard practice to allow for disposition at appropriate licensed facilities and will be managed in accordance with applicable MassDEP regulations. Contract documents for the Project will include items related to soil management.

BOS 59 **The DEIR should consider the regulatory requirements included in the MassDEP policy regarding Construction of Buildings in Contaminated Areas.**

Section 6.11.1 contains a discussion of the regulatory status of the site and regulatory requirements for working in the area.

BOS 60 The ENF text on Non-Structural Controls mentions that onsite storage of hazardous materials or toxic chemicals during construction will be limited to what is absolutely necessary. Additional details regarding the nature of these materials should be provided in the DEIR, as well as spill prevention and control procedures, especially for construction equipment and vehicles.

A draft spill response plan, predominantly governing refueling activities, is provided in the Draft CMP in Attachment L. It is not anticipated that any significant volumes of hazardous materials or toxic chemicals will be stored on-site during construction; however, if small quantities of such materials storage becomes necessary, the contractor will obtain all required approvals.

BOS 61 The ENF text on dewatering notes that dewatering discharges will be infiltrated into the ground where possible. This may be difficult due to the shallow groundwater table at the site as well as the potential for contamination as noted in the ESA. The DEIR should include:

- Locations where significant dewatering efforts are anticipated such as the parking garage
- BMPs/groundwater treatment options and disposal locations
- Applicable regulatory requirements

With the exception of limited excavation for on-site utilities, the only areas where dewatering is expected to be needed will be the basement levels of the new casino and parking garage. Excavations are anticipated to go as deep as El. 12 (for pile caps, which is approximately zero to one foot below recently-measured groundwater levels. Attachment F contains a stormwater report with an Operations and Maintenance Plan as well as an Erosion and Sedimentation Control Plan that outlines construction operations including potential stockpiling and dewatering locations. Section 9.3 describes stormwater management.

BOS 62 Contaminated material management issues that are likely to be encountered during Project construction and should be addressed in the DEIR include:

- Above ground storage tanks
- Underground storage tanks
- Existing hazardous materials in the maintenance garage
- PCBs – management and disposal of PCB-contaminated materials including building envelopes (e.g. window caulking) and electrical transformers

Underground storage tanks are discussed in Section 6.11.5 and construction-period materials management and handling procedures, including construction and demolition debris, are described in the Draft CMP in Attachment L.

BOS 63 The ENF states that based on a review of hourly traffic data over a 24-hour period, the Proponent will conduct noise impact analysis for two scenarios, a daytime off-peak hour and a nighttime hour. In the DEIR, 24-hour casino equipment and operational noise, and not just traffic noise, should be used in selecting these scenarios. At a minimum, the two scenarios should be: (1) hour of greatest increase over existing background monitored noise level; and (2) hour of highest combined total noise impact. If neither of these occurs during a nighttime hour, a nighttime hour should be added to assess sleep disturbance impact. A better and more informative analysis would also include a complete hour-by-hour 24-hour noise profile of the facility at build-out.

Details of the mobile source noise analysis are discussed in Section 6.6.4.2.

BOS 64 The ENF states that a baseline sound level monitoring program will be conducted in and around residential neighborhoods to the north, east, and south of the Project site. The DEIR should include the results of 24-hour monitoring for a representative weekday and weekend day at potentially affected sensitive receptor locations in these neighborhoods. Potentially affected sensitive receptors could be those near the Project site, near traffic noise sources, and those farther away but with direct line of sight to the proposed facility.

The baseline sound level monitoring program is discussed in Section 6.6.3.

BOS 65 The proposed Boardman Street flyover and increase bus activity in the Suffolk Downs parking areas should be included as possible new noise sources in the DEIR noise assessment.

The mobile source noise analysis is discussed in Section 6.6.4.2.

BOS 66 The DEIR should include construction noise impact modeling and not be limited to a generic discussion of mitigation measures. Since the construction period will be 30 months or more adjacent to residential areas, the modeling could inform specific mitigation measures related to activity siting, enclosures, and specifications for equipment muffling.

A screening-level quantitative analysis of potential noise impacts during construction is discussed in Section 6.6.4.3.

BOS 67 The ENF states that noise impact will be evaluated based on City of Boston noise regulations and FHWA Noise Abatement Criteria. The DEIR should also compare Project equipment noise levels to MassDEP sound level criteria, and compare total modeled combined noise impacts (equipment, idling buses, other site activity, and increase traffic) at nearby residential sensitive receptors to EPA and HUD day-night residential noise impact criteria.

Predicted sound levels from the Project are evaluated against City of Boston, FHWA, MassDEP, EPA, and HUD noise impact criteria in Section 6.6.4.

BOS 68 **The ENF does not mention any additional protection to prevent exposure to adjacent tank farms or the onsite landfill in a flooding event. A review of the adequacy of existing protection should be included in the DEIR.**

The Project does not include additional protection measures from the neighboring tank farm; the tank farm has containment berms around each of the tanks in accordance with best practices and federal regulation, and these berms have been constructed to the property line. In some cases, a small amount of the berm is actually on Suffolk Downs' property. Wetlands exist on the Suffolk Downs side of the berms. Increasing the height of these berms would include construction on the tank farm property as well as impact existing wetlands. Therefore, increasing the height of these berms would be impractical. The on-site landfill is completely underground; therefore, any flooding that occurs on the site will not adversely impact the landfill or have negative impacts on the Project.

BOS 69 **The DEIR should describe how and where potentially hazardous materials will be stored on site.**

A draft spill response plan, predominantly governing refueling activities, is provided in the Draft CMP in Attachment L. It is not anticipated that any significant volumes of hazardous materials or toxic chemicals will be stored on-site during construction; however, if small quantities of such materials storage becomes necessary, the contractor will obtain all required approvals.

BOS 70 **The DEIR should include a detailed discussion of post-construction solid waste management and recycling, as well as abatement of asbestos-containing materials and lead-based paint. The ENF states that the Proponent is committed to studying anaerobic digestion for both solid organic waste diversion and for on-site energy production. We support this approach, and encourage the Proponent to commit to implementation as well.**

Materials handling, including asbestos-containing materials and lead-based paint, is addressed in the Draft CMP in Attachment L. Due to space requirements for setting up an on-site digester with pre- and post-digester material processing and dewatering equipment combined with the highly variable production of manure from the barns, the Proponent determined that off-site digestion of organic waste is much more practicable. While the volume of organic waste produced on site will be sizable, the combination of seasonal variation and the total amount of material produced is much smaller than would be required to justify an on-site digester. Even if a digester operation were scaled down to a size needed for the volume of

material produced on site, additional material would need to be trucked onto the site seasonally, which would require the facility to be permitted for and become a waste receiver for at approximately six months a year.

BOS 71 **The City is interested in reviewing socioeconomic studies related to induced growth and community impacts, including those referenced in MEPA regulations.**

The Proponent has provided these studies, which are not typically part of a MEPA review, directly to the City.

BOS 72 **Pursuant to the Environmental Justice Policy of the Executive Office of Environmental Affairs, this Project is within an environmental justice population (see paragraphs 14 and 15 of the Policy). The scope of the DEIR should include provisions to comply with this policy.**

Section 1.10 discusses socioeconomics and EJ.

BOS 73 **The DEIR should include discussion of current land use and character of adjacent areas (within a defined study area) to assess compatibility and visual character.**

Section 4.0 describes the building design, which addresses the Project context as well.

BOS 74 **The DEIR should describe in greater detail how the massing and building heights within the Project will compare to surrounding neighborhood.**

Section 4.3.2 describes massing, form, and response to the Project site context.

BOS 75 **The ENF presents very general information about wetland impacts and mitigation, although we are encouraged by the new landscaping information provided at the March 6 MEPA consultation session, which indicates that portions of the site will be returned to their natural state as wetland. We look forward to reviewing more detailed information in the DEIR.**

Section 4.4 describes landscape restoration.

BOS 76 **The ENF indicates that there will be approximately 480,000 square feet of filling within BLSF and that compensatory storage will be provided. The DEIR should provide the locations and plans for providing required flood storage.**

The Project includes work within the 100-year floodplain, with grading consisting of cutting and filling. A floodplain compensation area will be provided in the vicinity of the Resort entrance. Section 2.3.5 contains a summary of floodplain cuts and fills; the Project will not result in any net filling of the 100-year floodplain.

March 22, 2013

Ms. Elizabeth Dello Russo
City of Boston Law Department
City of Boston
City Hall, Room 615
Boston, MA 02201

Reference: The Resort at Suffolk Downs

Dear Ms. Dello Russo:

Per your request we are reissuing our "gap analysis" letter of December 17, 2012 for use as an attachment to the City's comment letter on the Environmental Notification Form filed with the state regarding the above project. On January 7, 2013 VHB issued a response to the December 17, 2012 letter on behalf of the project proponent. In its letter VHB noted that many of the issues raised in the gap analysis would be more fully addressed in the Draft Environmental Impact Report (DEIR) to be filed with the state. The issues for which the City should expect to see more information in the DEIR are listed below. The listed items are generally the same as included in the December 17, 2012 letter except that some comments have been consolidated and all have been grouped by subject matter.

Study Scope

The traffic study area should be expanded to include the following locations: **STAN 01**

1. The full Bennington Street/Route 1A interchange area to also include the closely-spaced Saratoga Street, Bremen Street and Chelsea Street intersections with Neptune Road. The Bennington Street/Neptune Road intersection is presently part of the study area.

2. Additional intersections along Bennington Street between Neptune Road and Saratoga Street as necessary to fully understand the potential impact of a proposed bike lane on Bennington Street and to understand opportunities to enhance traffic signal coordination and control along this corridor.

3. The Route 1A southbound intersections with the southbound on ramp from Route 145 and with Curtis Street. These "K-type" intersections are subject to some unique and potentially unsafe queuing and merge conditions that warrant a safety analysis.

The traffic study scope should also be expanded into the following areas:

4. FHWA Permits: Identify any applicable Federal permit or review requirements associated with proposed off-site transportation system improvements. Explain how these requirements will be met. **STAN 02**

5. Construction Management: Provide a construction management plan for the proposed development as well as proposed off-site transportation system improvements. Provide a traffic management plan to address traffic impacts associated with construction of off-site transportation system improvements. **STAN 03**

Study Assumptions

Certain assumptions used in the traffic analysis should be verified or revised as noted below.

1. Provide the source data used as the basis of the trip generation estimates for the project. It is understood that only one active urban casino resort was counted in developing trip generation rates for the project. Data should be provided for additional locations. **STAN 04**

2. Source data used to develop the mode split for project related trips should be provided. Obtain and present relevant data for the existing race track to help define existing trip distribution and mode choice patterns for patrons and guests. **STAN 05**

3. Historic traffic volume data for study area roadways, particularly Route 1A, should be provided. Data for pre-recession (2007 and earlier) traffic conditions is specifically requested. Many areas have seen traffic declines since the economic recession began in 2008. It may make sense to use pre-recession traffic volume levels for existing or baseline conditions. **STAN 06**

4. Determine the level of racetrack activity occurring during the traffic count program that was done for the project. Adjust baseline traffic volumes as appropriate to reflect typical racetrack activity under existing conditions. **STAN 07**

5. A detailed explanation of temporal traffic impacts and derivation of critical analysis period should be provided. Emphasis should be on Route 1A operations looking at hourly background volumes, hourly casino traffic volumes and hourly racetrack volumes in combination. No data has been provided to understand daily and hourly variations in racetrack volumes and how these volumes may change over time with a casino resort constructed on site. **STAN 08**

6. Update assumptions related to background development and its anticipated traffic impacts. New projects have been identified by the City since the traffic count program was conducted. Assumptions regarding the inclusion/exclusion of the BJ's Wholesale and Seaport Square projects should be clarified. The applicant should obtain a current list of active projects from both Revere and Boston. **STAN 09**

Study Methods/Analysis

Certain study methods should be explained or reconsidered as described below. Additional analyses should also be provided as listed.

1. Provide a systems analysis for the proposed Route 1A improvements to consider coordinated signal operations, traffic progression and vehicle stacking between closely spaced intersections. Presently, the Route 1A intersections have been analyzed as if each were operating in isolation. Explain how **STAN 10**

clearance times have been considered in the analysis of the proposed mitigation plans. Some very wide intersections are proposed requiring long clearance times and long pedestrian signal phases.

2. Provide a detailed parking evaluation. This evaluation should look at temporal parking demands for the racetrack, casino, hotels and special events. Comparisons should be made to the proposed future parking supply. The proposed parking management plan should be described indicating how and if off-site parking might be used to serve special event parking demands. The study should also explain how the parking management plan will balance the competing goals of minimizing vehicle trip generation for the facility while precluding casino related parking in adjacent neighborhoods. (If limiting the number of parking spaces on the site is used as a strategy to reduce vehicular traffic demands might this result in increased parking demands on neighborhood streets and at nearby MBTA lots?) **STAN 11**

3. Describe transit and pedestrian access in terms of trip distance to/from the front and back doors of the casino. The site is quite large hence; walking distances should be measured to the casino front door for patrons and from the back door for employees not just "to the site". Actual walking distances should be considered in the mode choice and trip distribution evaluations as well as in the mitigation plans. Provide a map or plan depicting the location, width and condition of all pedestrian facilities located within walking distance of the site. **STAN 12**

4. Provide a comprehensive transit system impact analysis including a discussion of Existing, No Build and Build condition load factors on routes serving the site. Assess the impact of the project on nearby Blue Line parking facilities recognizing that employees will be encouraged to access the site via public transportation. **STAN 13**

5. Develop and analyze post-Build traffic conditions on key study area roadways that consider the potential impact of induced development and redevelopment that may occur if and when approval of the casino project is certain. **STAN 14**

6. Describe and compare past redevelopment plans for the subject site to the proposed casino plan. Consider trip generation impacts and traffic mitigation plans. **STAN 15**

7. Describe how hotel traffic has been included in the traffic analysis. The one site referenced in developing trip generation rates for the study does not include a hotel. **STAN 16**

8. Explain and describe alternative mitigation plans for the Route 1A/Boardman Street intersection. Discuss the positive and negative elements of full grade-separation and other strategies in terms of operations, land impacts, construction timetable and cost. **STAN 17**

9. Recalibrate the existing conditions intersection analyses particularly for Bennington Street where some intersections/turning movements are reportedly operating with volume-to-capacity ratios in excess of 5.0. **STAN 18**

10. Explain the appropriateness of analyzing traffic circles in the project area as roundabouts. Verify that the analysis model applied reflects field-observed operating protocol. Yield upon entry is assumed for roundabout operations. Drivers in Massachusetts do not always follow this protocol at traffic circles. **STAN 19**

Mitigation

The traffic study should better define transportation mitigation plans and/or offer additional mitigation as described below.

1. Provide traffic mitigation plans for Bennington and Saratoga Street to address reported poor intersection levels of service. Describe possible strategies to upgrade signal systems and connect them to the City's traffic control center. **STAN 20**

2. Provide 20-scale or 40-scale conceptual plans for the Route 1A improvements with proposed limits of work and rights-of-way shown. The plans should describe proposed improvements to pedestrian areas, treatment of medians and below-roadway areas. **STAN 21**

3. Provide documentation regarding the timing of mitigation/transportation improvements proposed along roadways in Revere. It is suggested that some of these improvements will be "built by others" and may not be in place prior to project opening. **STAN 22**

4. Provide a detailed description of proposed enhancements to existing pedestrian, bicycle and transit access to and within the site. Identify site access locations for pedestrians and bicyclists. Identify new pedestrian and bike facilities to serve the site including the proposed DCR bike path extension and spur to Bennington Street. Clarify funding and timing for these improvements along with any project contribution to these plans. **STAN 23**

5. Develop, describe and commit to strategies to transport transit-dependent employees who may commute during non-operating hours for the MBTA. **STAN 24**

6. Consider the need to modify time limits and/or introduce other parking management strategies to ensure that adequate on-street parking remains available to local residents on city streets. Provide "duration of stay" information for site visitors and compare the typical durations to time limits for on-street parking in the site environs. **STAN 25**

7. Provide a detailed way finding plan that will aid visitors accessing the site along major routes. Explain strategies that will be used to deter employees, taxicabs, delivery vehicles and other regular site visitors from using "short cuts" through residential areas. **STAN 26**

8. Explain in greater detail proposed Travel Demand Management strategies, goals and objectives to minimize site traffic generation. Explain how participation by the casino in the local Transportation Management Association might help reduce the number of vehicle trips generated by other TMA members. **STAN 27**

9. Describe any traffic monitoring plans that may be put in place after project opening to: confirm the traffic forecasts offered during the permitting process; determine if the goals of the TDM plan are met; and, inform decision making relative to the implementation of additional post-build mitigation measures. Describe financial resources that would be committed to post-build traffic mitigation to address unforeseen circumstances. **STAN 28**

10. Water Transportation: Describe any water transportation plans that may be in place and how the project may be able to make use of water access given East Boston's geographic location. **STAN 29**

11. Public Safety: Describe and commitment to any special elements of the site access management plan to facilitate access by emergency vehicles. **STAN 30**

12. Discuss possible or proposed MBTA bus route modifications that could provide more convenient site access. Describe possible changes to the MBTA Blueline Suffolk Downs and Beachmont stations to better handle the ridership increases and shuttle bus traffic anticipated at these stations. Similarly, describe and commit to streetscape improvements along Winthrop Avenue as necessary to support increased pedestrian activity between the site and the Beachmont station. **STAN 31**

13. Describe existing and proposed accommodations for pedestrians to cross Route 1A in the site vicinity and any pedestrian improvements/ amenities proposed along the Route 1A corridor. **STAN 32**

14. Explain how bus staging will be managed on site. Describe measures that will be taken to minimize noise and air impacts to adjacent residential areas. **STAN 33**

The above list is not meant to be all inclusive as additional issues will likely be identified as the project moves forward. Please do not hesitate to contact us if you have any questions regarding the above.

Regards,

Fax: (802) 864-0165
Richard.Bryant@stantec.com

STAN 01 The traffic study area should be expanded to include the following locations:

- The full Bennington Street/Route 1A interchange area to also include the closely-spaced Saratoga Street, Bremen Street and Chelsea Street intersections with Neptune Road. The Bennington Street/Neptune Road intersection is presently part of the study area.
- Additional intersections along Bennington Street between Neptune Road and Saratoga Street as necessary to fully understand the potential impact of a proposed bike lane on Bennington Street and to understand opportunities to enhance traffic signal coordination and control along this corridor.
- The Route 1A southbound intersections with the southbound on ramp from Route 145 and with Curtis Street. These "K-type" intersections are subject to some unique and potentially unsafe queuing and merge conditions that warrant a safety analysis.

All of the requested locations are included in the transportation analysis study area (see Section 5.0).

STAN 02 Identify any applicable Federal permit or review requirements associated with proposed off-site transportation system improvements. Explain how these requirements will be met.

No Federal permit or review is required for the proposed off-site transportation improvements.

STAN 03 Provide a construction management plan for the proposed development as well as proposed off-site transportation system improvements. Provide a traffic management plan to address traffic impacts associated with construction of off-site transportation system improvements.

The Draft CMP in Attachment L discusses construction management, including traffic management.

STAN 04 Provide the source data used as the basis of the trip generation estimates for the Project. It is understood that only one active urban casino resort was counted in developing trip generation rates for the Project. Data should be provided for additional locations.

Detailed research of trip generation, including counts performed at comparable locations, is presented in Sections 5.4.1 through 5.4.4.

STAN 05 **Source data used to develop the mode split for the Project-related trips should be provided. Obtain and present relevant data for the existing racetrack to help define existing trip generation and mode choice patterns for patrons and guests.**

Analysis of mode share for patrons, guests, and employees is presented in Section 5.4.5.

STAN 06 **Historic traffic volume data for study area roadways, particularly Route 1A, should be provided. Data for pre-recession (2007 and earlier) traffic conditions is specifically requested.**

An analysis of historic pre-recession traffic volume data is included in Attachment A.

STAN 07 **Determine the level of racetrack activity occurring during the traffic count program that was done for the Project. Adjust baseline traffic volumes as appropriate to reflect typical racetrack activity under existing conditions.**

Baseline traffic counts were performed during the active racing season, and it has been determined that no adjustment is necessary.

STAN 08 **A detailed explanation of temporal traffic impacts and derivation of critical analysis period should be provided. Emphasis should be on Route 1A operations looking at hourly background volumes, hourly casino traffic volumes and hourly racetrack volumes in combination. No data has been provided to understand daily and hourly variations in racetrack volumes and how these volumes may change over time with a casino resort constructed on site.**

Analyses of temporal background volumes and Project traffic are included in Sections 5.2.8, 5.2.9, 5.4.2, and 5.4.6.

STAN 09 **Update assumptions related to background development and its anticipated traffic impacts. New projects have been identified by the City since the traffic count program was conducted. Assumptions regarding the inclusion/exclusion of the BJ's Wholesale and Seaport Square projects should be clarified. The applicant should obtain a current list of active projects from both Revere and Boston.**

Assumptions regarding background development, in response to City of Revere and City of Boston requirements, are presented in Section 5.3.2.

STAN 10 **Provide a systems analysis for the proposed Route 1A improvements to consider coordinated signal operations, traffic progression and vehicle stacking between closely spaced intersections. Presently, the Route 1A intersections have been analyzed as if each were operating in isolation. Explain how clearance times have**

been considered in the analysis of the proposed mitigation plans. Some very wide intersections are proposed, requiring long clearance times and long pedestrian signal phases.

An alternatives analysis for the proposed Route 1A infrastructure improvements is presented in Section 5.5.

STAN 11 Provide a detailed parking evaluation. This evaluation should look at temporal parking demands for the racetrack, casino, hotels and special events. Comparisons should be made to the proposed future parking supply. The proposed parking management plan should be described indicating how and if off-site parking might be used to serve special event parking demands. The study should also explain how the parking management plan will balance the competing goals of minimizing vehicle trip generation for the facility while precluding casino related parking in adjacent neighborhoods. (If limiting the number of parking spaces on the site is used as a strategy to reduce vehicular traffic demands, might this result in increased parking demands on neighborhood streets and at nearby MBTA lots?)

The parking analysis is presented in Section 5.10.

STAN 12 Describe transit and pedestrian access in terms of trip distance to/from the front and back doors of the casino. The site is quite large; hence, walking distances should be measured to the casino front door for patrons and from the back door for employees not just "to the site." Actual walking distances should be considered in the mode choice and trip distribution evaluations as well as in the mitigation plans. Provide a map or plan depicting the location, width and condition of all pedestrian facilities located within walking distance of the site.

On-site pedestrian accommodations are described in detail in Sections 1.0 and 4.0. Walking distance is included in the determination of mode share for patrons and employees in Section 5.4. Off-site pedestrian facilities are shown in the corresponding figures of improvements to be provided in the HCAs with Revere and Boston.

STAN 13 Provide a comprehensive transit system impact analysis including a discussion of Existing, No Build and Build condition load factors on routes serving the site. Assess the impact of the Project on nearby Blue Line parking facilities recognizing that employees will be encouraged to access the site via public transportation.

Comprehensive analyses of transit impacts for existing and future conditions are presented in Sections 5.2.1 and 5.8.1, respectively. It is not anticipated that significant numbers of employees will park-and-ride at Blue Line stations, as parking is available only at Blue Line stations relatively close to the site. The parking plan for employees is presented in Section 5.10.3.

STAN 14 **Develop and analyze post-Build traffic conditions on key study area roadways that consider the potential impact of induced development and redevelopment that may occur if and when approval of the casino project is certain.**

The DEIR/EPNF analysis includes year 2022 No Build and Build analyses which include regional background growth as determined by MassDOT and including all background projects required by the cities of Revere and Boston.

STAN 15 **Describe and compare past redevelopment plans for the subject site to the proposed casino plan. Consider trip generation impacts and traffic mitigation plans.**

An analysis of alternative site development scenarios is presented in Section 1.9.

STAN 16 **Describe how hotel traffic has been included in the traffic analysis. The one site referenced in developing trip generation rates for the study does not include a hotel.**

Hotel traffic is included in the overall Project trip generation, as the comparable locations at which counts were performed include hotels.

STAN 17 **Explain and describe alternative mitigation plans for the Route 1A/Boardman Street intersection. Discuss the positive and negative elements of full grade-separation and other strategies in terms of operations, land impacts, construction timetable and cost.**

An alternatives analysis for the Route 1A infrastructure improvements is presented in Section 5.5.

STAN 18 **Recalibrate the existing conditions intersection analyses particularly for Bennington Street where some intersections/turning movements are reportedly operating with volume-to-capacity ratios in excess of 5.0.**

Given the regulatory environment through which DEIR/EPNF findings are reported, and the general desire to not modify factors within the base Synchro program, the Proponent considers that the models should be used for comparative purposes between various conditions. This is especially true where Project-related impacts are of such a scale that they could be assumed to be within the average daily traffic variation of an intersection during one of the analyzed peak hours.

STAN 19 **Explain the appropriateness of analyzing traffic circles in the project area as roundabouts. Verify that the analysis model applied reflects field-observed operating protocol. Yield upon entry is assumed for roundabout operations.**

The study area intersections of Butler Circle, Brown Circle, and Eliot Circle are defined as roundabouts in Chapter 21 of the Highway Capacity Manual (HCM 2010). By definition, vehicles entering the roundabout must yield to circulating

traffic, which is true for all three locations. In addition, state law in the Commonwealth of Massachusetts requires all entering vehicles to yield to traffic within the circle. As such, Bell Circle (a.k.a. Mahoney Circle) and Copeland Circle are not defined as roundabouts and were analyzed as discussed in Section 5.0.

STAN 20 **Provide traffic mitigation plans for Bennington and Saratoga Street to address reported poor intersection LOS. Describe possible strategies to upgrade signal systems and connect them to the City's traffic control center.**

Plans for improvements at Bennington and Saratoga Street are described in Section 5.6.3.

STAN 21 **Provide 20-scale or 40-scale conceptual plans for the Route 1A improvements with proposed limits of work and rights-of-way shown. The plans should describe proposed improvements to pedestrian areas, treatment of medians and below-roadway areas.**

Concept plans for all options developed for the Route 1A infrastructure improvements are presented in Section 5.5.

STAN 22 **Provide documentation regarding the timing of mitigation/transportation improvements proposed along roadways in Revere. It is suggested that some of these improvements will be "built by others" and may not be in place prior to Project opening.**

Commitments regarding timing of improvements along roadways in Revere are included in the City of Revere HCA, which is provided in Attachment B.

STAN 23 **Provide a detailed description of proposed enhancements to existing pedestrian, bicycle and transit access to and within the site. Identify site access locations for pedestrians and bicyclists. Identify new pedestrian and bike facilities to serve the site including the proposed DCR bike path extension and spur to Bennington Street. Clarify funding and timing for these improvements along with any Project contribution to these plans.**

On-site pedestrian and bicycle accommodations are described in detail in Section 1.4. Off-site improvements to be funded by the Proponent are described in Sections 5.8.2 and 5.8.3, and in the HCA commitments described in Section 5.6.

STAN 24 **Develop, describe and commit to strategies to transport transit-dependent employees who may commute during non-operating hours for the MBTA.**

The shuttle plan described in Section 5.8.3.2 will be the primary approach to addressing the gap in overnight transit service. As part of that plan, the Proponent is committed to collaborating with other transportation providers including Massport,

the MBTA, and private entities in the region. As described in the TDM plan in Section 5.9, the Proponent will adjust employee shift times to the extent possible to reflect transit availability although, as noted, there will be multiple shift times during the 24-hour day.

STAN 25 **Consider the need to modify time limits and/or introduce other parking management strategies to ensure that adequate on-street parking remains available to local residents on city streets. Provide "duration of stay" information for site visitors and compare the typical durations to time limits for on-street parking in the site environs.**

A parking analysis for the Project is presented in Section 5.10. The Proponent has committed to supporting City of Boston (and City of Revere) initiatives to protect neighborhood streets by expanding parking restrictions and the resident parking permit program.

STAN 26 **Provide a detailed way-finding plan that will aid visitors accessing the site along major routes. Explain strategies that will be used to deter employees, taxicabs, delivery vehicles and other regular site visitors from using "short cuts" through residential areas.**

The Proponent will work with MassDOT, DCR, and the cities of Revere and Boston to develop appropriate directional signage to the Resort.

STAN 27 **Explain in greater detail proposed TDM strategies, goals and objectives to minimize site traffic generation. Explain how participation by the casino in the local Transportation Management Association might help reduce the number of vehicle trips generated by other TMA members.**

A robust TDM plan for the Project is described in Section 5.9.

STAN 28 **Describe any traffic monitoring plans that may be put in place after Project opening to: confirm the traffic forecasts offered during the permitting process; determine if the goals of the TDM plan are met; and inform decision making relative to the implementation of additional post-build mitigation measures. Describe financial resources that would be committed to post-build traffic mitigation to address unforeseen circumstances.**

Commitments to monitoring, which are to be coordinated with MassDOT and BTD, are identified in Section 5.9.5.

STAN 29 **Water Transportation: Describe any water transportation plans that may be in place and how the Project may be able to make use of water access given East Boston's geographic location.**

The Proponent supports Mayor Menino's vision to enhance water transportation options to East Boston by instituting regular water shuttle service between the South Boston and East Boston waterfronts. As such, the Boston HCA includes a contribution that will assist the City in establishing this service.

STAN 30 **Public Safety: Describe and commit to any special elements of the site access management plan to facilitate access by emergency vehicles.**

The Project will maintain three access points to the site: (1) Tomasello Drive entry from Route 1A; (2) Tomasello Drive entry from Winthrop Avenue; and (3) emergency vehicle restricted access from Walley Street.

STAN 31 **Discuss possible or proposed MBTA bus route modifications that could provide more convenient site access. Describe possible changes to the MBTA Blue Line Suffolk Downs and Beachmont stations to better handle the ridership increases and shuttle bus traffic anticipated at these stations. Similarly, describe and commit to streetscape improvements along Winthrop Avenue as necessary to support increased pedestrian activity between the site and the Beachmont station.**

The Proponent has committed to providing an MBTA bus stop on-site should the MBTA wish to route bus service through the Project site. While it is the least-used station on the blue Line, the Proponent has had preliminary discussions with MBTA staff, and will continue to explore the need for improvements at Suffolk Downs Station to handle increased demand. Proposed streetscape and pedestrian improvements in Donnelly Square adjacent to Beachmont Station and along Winthrop Avenue between the station and the Project site access at Tomasello Drive are described in Section 5.6.

STAN 32 **Describe existing and proposed accommodations for pedestrians to cross Route 1A in the site vicinity and any pedestrian improvements/amenities proposed along the Route 1A corridor.**

Pedestrian accommodations on Route 1A differ in the various alternatives presented in Section 5.5. Pedestrian accommodations and safety will continue to be key priorities in advancing concept design in coordination with MassDOT and BTD.

STAN 33 **Explain how bus staging will be managed on site. Describe measures that will be taken to minimize noise and air impacts to adjacent residential areas.**

Project modeling has accounted for traffic, including buses, along Blue Line Drive. Anticipated impacts are within applicable FHWA noise limits. The noise and air analyses are included in Section 6.0.

Caesars Resort at Suffolk Downs
Transportation

Dear Secretary Sullivan:

The City of Boston is pleased to have the opportunity to comment on the Environmental Notification Form (ENF) submitted by Sterling Suffolk Racecourse, LLC ("Suffolk") for the above referenced project. The City, and specifically the Boston Transportation Department (BTD), is committed to protecting the transportation interests of the City of Boston relative to the resort proposal. The City and the community agree that traffic and transportation are a priority. With that in mind, the City is applying the highest standards to the developer's transportation plans, and asks that the state do the same. Many community members have concerns about transportation impacts from the proposed development. We understand that these concerns include but are not limited to assurances that:

- Mobility will not be degraded on roadways in the site environs;
- Sufficient capacity and improvements will be available on the MBTA Blue Line and area bus routes to meet resident and resort needs;
- Resort patrons and employees will not be parking on City streets in the East Boston neighborhood;
- Proposed transportation analysis and planning addresses all modes – automobile, transit, pedestrian, bicycle and water; and,

- Adequate measures will be employed to mitigate construction impacts.

Accordingly, we view the MEPA (Massachusetts Environmental Policy Act) review process as a valuable complement to the City of Boston's own project review process and an important means to address the concerns of the community.

While the scope of this letter is limited to transportation, the City's interests and review extend well beyond transportation issues. As such, a second letter is also being submitted to your office by the City commenting on non-transportation elements of the project's anticipated environmental impacts. *See Attachment A, March 26, 2013 City of Boston Environment and Energy Service Cabinet Letter.* Likewise, this letter does not encompass all of the City's transportation review of this project, much of which is happening at a local level. In an effort to share with your office the scope of the City's transportation review, attached please find a separate gap analysis letter that the City has sent to the proponent. *See Attachment B, March 22, 2013 Stantec Consulting Letter.*[1] The supplemental information filed with the ENF is informative in describing the project and its potential environmental impacts. Receipt of these materials has enabled the City to informally initiate its own project review process. Under the City's own review process the City will fully consider site plan and roadway impacts within our jurisdiction. However, through the MEPA process we seek to understand potential project impacts, and perhaps influence decisions, regarding transportation facilities and services in the City that are under state jurisdiction.

A. Importance of Route 1A and the MBTA

The City has specific transportation concerns that relate to State Route 1A and Massachusetts Bay Transportation Authority (MBTA) operations and facilities. Suffolk's preliminary transportation analysis notes the importance of Route 1A and the MBTA in providing safe and efficient access to the subject site. The analysis estimates that ten percent (10%) of the patron trips and thirty-five percent (35%) of the employee trips will be made by public transportation. Of the estimated 24,600 daily vehicle trips generated to/from the site, eighty-two percent (82%) are expected to use Route 1A, with approximately seventy percent (70%) oriented to the south of downtown Boston. The City is seeking assurances through the MEPA process that Route 1A and the MBTA have adequate capacity to handle these increased travel demands, and to prevent any excess demand spill-over onto City streets. Several City roadway intersections, as indicated in Suffolk's preliminary traffic investigations, are already operating at or near capacity and cannot readily accommodate increased traffic volumes. Therefore, the City asks that the state request from the proponent a detailed impact assessment and recommendations to protect the community from any potential impact, particularly related to Route 1A and the MBTA. **BTD 01**

B. Route 1A

[1] The City of Boston has hired Stantec Consulting to assist with its review of the proposed resort development.

Printed on recycled paper

We look forward to the submission of a Draft Environmental Impact Report (DEIR) by Suffolk that includes a transportation study prepared in full conformance with the *EOEEA/MassDOT Guidelines for EIR/EIS Traffic Impact Assessment* (the *Guidelines)*. We ask that the study include all of the intersections listed in Attachment A/Section 3.2.6 (Proposed Study Area) of the ENF plus the following intersections: **BTD 02**

- Route 1A/Curtis Street
- Saratoga Street/Neptune Road
- Bremen Street/Neptune Road

The other study area intersections in the City of Boston, per ENF Attachment A/Section 3.2.6, we understand to include:

- Route 1A at Jughandle/Tank Farm Access
- Route 1A at Tomasello Drive (Suffolk Downs)
- Route 1A Northbound at Waldemar Avenue
- Route 1A at Boardman Street
- Bennington Street at Saratoga Street
- Bennington Street at Neptune Road
- Neptune Road at Route 1A Northbound Off-ramp
- Boardman Street at Saratoga Street

Additional intersections are to be considered in the City of Revere.

Consistent with the *Guidelines,* we would expect the DEIR to describe existing and anticipated future transportation conditions to at least the level of detail provided in the preliminary study with more specific and more firm commitments to transportation mitigation. Likewise, we expect Suffolk to address in the DEIR, and/or at the City level as appropriate, the issues raised in the attached "gap analysis" letter (Attachment B) prepared by the City's transportation consultant for this project. **BTD 03** **BTD 04**

Due to certain unique elements of the project we ask that the EOEEA require Suffolk to include analyses which may not be specifically identified in the *Guidelines*. First, we ask that a "post-build" analysis be completed for at least Route 1A in the site vicinity. We understand that inclusion of a post-build analysis is typical of traffic studies conducted for gaming resorts that are subject to federal review. Federal reviewers recognize that the introduction of gaming to an **BTD 05**

Printed on recycled paper

area tends to attract additional "induced" development that will further increase travel demands after the gaming resort is built. In this case individual "induced development" projects may not be subject to MEPA review due to their size and/or location yet the cumulative impact of this type of development could have significant impacts on Route 1A traffic operations. Given the scope, cost and construction duration of improvements suggested by Suffolk for Route 1A, the northbound flyover at Boardman Street, decision-making regarding the Route 1A plan should look beyond the typical five-year time horizon considered in the *Guidelines*. It is standard practice for MassDOT to require preparation of a Functional Design Report (FDR) for a roadway project of this scale. Perhaps the FDR traffic analysis could be included in the DEIR as the "post-build" analysis. Second, we ask that the DEIR include an alternatives analysis for the suggested Route 1A improvements. Again, given the scale and cost of the suggested improvements, whatever is built for the proposed resort is likely to remain in place for many years. We ask that alternative Route 1A treatments be presented in the DEIR and evaluated in a matrix format describing as appropriate: **BTD 06**

- AM and PM peak hour traffic operations (level of service and volume-to-capacity ratio) for Route 1A intersections with Boardman Street, Tomasello Drive, Waldemar Avenue and the U-Turn/Tank Farm Access;
- Construction costs;
- Construction time period;
- Land acquisition requirements (number of parcels, number of property owners, total acreage, estimated land value); and,
- Pedestrian and bike accommodations and "pedestrian friendliness," (wider roads will make crossing Route 1A more difficult and/or dictate the need for grade separated crossings).

Supporting traffic flow networks, traffic operations analysis worksheets, cost estimate worksheets, construction phasing plans and preliminary taking plans may also be provided in the DEIR appendix to support the evaluation matrix.

C. MBTA

The City asks that a detailed impact analysis is done regarding the MBTA subway and bus line sites and services. The City would like the DEIR to consider project impacts on MBTA line capacities, including availability of service and station improvements. Many East Boston residents, businesses, patrons and visitors depend on these services. A detailed impact assessment is needed to protect and enhance the community from any potential impact. The City recommends that an MBTA analysis include review of shift times for employees at the resort, as well as capacity during rush hours, weekends and nighttime service. **BTD 07**

Printed on recycled paper

We also ask that in addition to considering project impacts on MBTA line capacities, that the DEIR also analyze the capacity of MBTA parking facilities serving the Blue Line. Presumably, the DEIR will look at peak load factors for Blue Line trains and MBTA buses serving the project site to determine if adequate capacity is available to carry resort-generated riders. Ideally, most of the new riders to the resort will access the MBTA system as pedestrians entering the system by way of downtown subway stations or boarding MBTA buses near their homes. However, employees approaching from communities located north of the project site may choose to park at Wonderland or Beachmont stations, particularly if employee parking on site is limited as part of the project's Travel Demand Management plan. The ability of these stations to handle increased parking demands should be considered. **BTD 08**

D. Parking

Also, and related to the above comment, is a request that Suffolk provide a comprehensive parking analysis and parking management plan in the DEIR for both the construction period as well as after opening. On-street parking along City streets proximate to Suffolk Downs in the Orient Heights neighborhood should be available to East Boston residents and their guests under both construction conditions and future conditions with the resort built. However, competition for these spaces will occur if adequate parking is not provided by the resort to meet typical and peak resort parking needs. The DEIR should analyze typical weekend and special event parking demands. Gaming activity and related parking demand are expected to peak on weekend evenings. Special events, such as live performances, conferences, and high-stakes horse racing, may add to weekend peaks and/or create peaks at others times. A plan should be provided to ensure that resort-related parking demands will be met in resort-controlled parking facilities at all times and not on neighborhood streets. **BTD 09**

E. Water

The ENF does discuss the possibility of using water transportation to alleviate roadway congestion, which the City of Boston is assessing and encourages. The City is requesting the proponent look at how the project can tie in to the water transportation network to downtown Boston and the Boston Harbor Islands national park. In addition to considering water transport during casino operations, the City has asked the proponent to evaluate the possibility of using water transport during project construction for construction materials and construction workers. **BTD 10** **BTD 11**

F. Construction Management Plan

Finally, as the project advances, the proponent will be required to develop and submit a detailed Construction Management Plan (CMP) to the Boston Transportation Department (BTD) for review and approval. The CMP will address Traffic Demand Management measures for construction workers, proposed truck routes and hours, street occupancies, equipment staging, sidewalk relocations and hours of construction work. **BTD 12**

Once again we thank you for providing us with the opportunity to comment on the Caesar's Resort at Suffolk Downs ENF. We look forward to reviewing the anticipated DEIR.

Regards,

Thomas J. Tinlin
Commissioner
Boston Transportation Department

Printed on recycled paper

BTD 01 The City is seeking assurances through the MEPA process that Route 1A and the MBTA have adequate capacity to handle these increased travel demands, and to prevent any excess demand spill-over onto City streets. Several City roadway intersections, as indicated in Suffolk's preliminary traffic investigations, are already operating at or near capacity and cannot readily accommodate increased traffic volumes.

Build condition traffic capacity analyses are presented in Sections 5.5 and 5.7. Build transit analysis is presented in Section 5.8.1.

BTD 02 We look forward to the submission of a DEIR by Suffolk that includes a transportation study prepared in full conformance with the EOEEA/MassDOT Guidelines for EIR/EIS Traffic Impact Assessment (the Guidelines). We ask that the study include all of the intersections listed in Attachment A/Section 3.2.6 (Proposed Study Area) of the ENF plus the following intersections:

- Route 1A/Curtis Street
- Saratoga Street/Neptune Road
- Bremen Street/Neptune Road

The DEIR/EPNF analysis is in conformance with the EEA/MassDOT Guidelines for Traffic Impact Assessment. The additional intersections requested have been included in the study area.

BTD 03 Consistent with the Guidelines, we would expect the DEIR to describe existing and anticipated future transportation conditions to at least the level of detail provided in the preliminary study with more specific and more firm commitments to transportation mitigation.

The DEIR/EPNF transportation analysis in Section 5.0 is substantially expanded and detailed in conformance with the Guidelines.

BTD 04 We expect Suffolk to address in the DEIR, and/or at the City level as appropriate, the issues raised in the attached "gap analysis" letter (Attachment B) prepared by the City's transportation consultant for this Project.

The Proponent has responded to all comments from the City's transportation consultant, Stantec, earlier in this section.

BTD 05 We ask that a "post-build" analysis be completed for at least Route 1A in the site vicinity. We understand that inclusion of a post-build analysis is typical of traffic studies conducted for gaming resorts that are subject to federal review. Federal reviewers recognize that the introduction of gaming to an area tends to attract

additional "induced" development that will further increase travel demands after the gaming resort is built. In this case individual "induced development" projects may not be subject to MEPA review due to their size and/or location yet the cumulative impact of this type of development could have significant impacts on Route 1A traffic operations. Given the scope, cost and construction duration of improvements suggested by Suffolk for Route 1A, the northbound flyover at Boardman Street, decision-making regarding the Route 1A plan should look beyond the typical five-year time horizon considered in the Guidelines. It is standard practice for MassDOT to require preparation of a Functional Design Report (FDR) for a roadway project of this scale. Perhaps the FDR traffic analysis could be included in the DEIR as the "post-build" analysis.

Federal review is not required for the proposed roadway improvements. The DEIR/EPNF traffic analysis horizon year is 2022. For Route 1A infrastructure improvement alternatives, a design year 2032 analysis is included.

BTD 06 We ask that the DEIR include an alternatives analysis for the suggested Route 1A improvements... We ask that alternative Route 1A treatments be presented in the DEIR and evaluated in a matrix format describing as appropriate:

- AM and PM peak hour traffic operations (LOS and volume-to-capacity ratio) for Route 1A intersections with Boardman Street, Tomasello Drive, Waldemar Avenue, and the U-Turn/Tank Farm Access;
- Construction costs;
- Construction time period;
- Land acquisition requirements (number of parcels, number of property owners, total acreage, estimated land value); and
- Pedestrian and bike accommodations and "pedestrian friendliness," (wide roads will make crossing Route 1A more difficult and/or dictate the need for grade-separated crossings).

Supporting traffic flow networks, traffic operations analysis worksheets, cost estimate worksheets, construction phasing plans and preliminary taking plans may also be provided in the DEIR appendix to support the evaluation matrix.

An alternatives analysis for Route 1A improvements is presented in Section 5.5.

BTD 07 The City asks that a detailed impact analysis is done regarding the MBTA subway and bus line sites and services. The City would like the DEIR to consider Project impacts on MBTA line capacities, including availability of service and station improvements... The City recommends that an MBTA analysis include review of shift times for employees at the resort, as well as capacity during rush hours, weekends and nighttime service.

A detailed transit impact analysis is presented in Section 5.8.1. Employee shift times are reflected in the analysis.

BTD 08 **We ask that... the DEIR also analyze the capacity of MBTA parking facilities serving the Blue Line... Employees approaching from communities located north of the Project site may choose to park at Wonderland or Beachmont stations, particularly if employee parking on site is limited as part of the Project's TDM plan.**

In an effort to limit trips to the site the Proponent is proposing to severely restrict employee parking, but it is not anticipated that significant numbers of employees will park at Wonderland or Beachmont stations. The employee parking plan is described in Section 5.10.3.

BTD 09 **[BTD requests] that Suffolk provide a comprehensive parking analysis and parking management plan in the DEIR for both the construction period as well as after opening. On-street parking along City streets proximate to Suffolk Downs in the Orient Heights neighborhood should be available to East Boston residents and their guests under both construction conditions and future conditions with the resort built... The DEIR should analyze typical weekend and special event parking demands.**

A parking analysis for the Project is presented in Section 5.10. The Proponent has committed to supporting City of Boston initiatives to protect neighborhood streets by expanding parking restrictions and the Resident Parking Permit program. During construction, personal vehicles will be allowed to park within designated areas at the Project construction site, and no construction vehicle parking will be allowed in adjacent neighborhoods. Terms and conditions to maximize protection of the neighborhoods related to workforce parking will be written into each subcontract and reviewed with each worker during a mandatory orientation. Terms and conditions encouraging public transportation use will be included in each subcontract. Overflow parking will be provided on the Project site to accommodate special events. These overflow parking spaces will consist of reinforced turf parking areas near the loading areas to the casino areas.

BTD 10 **The City is requesting the Proponent look at how the Project can tie into the water transportation network to downtown Boston and the Boston Harbor Islands national park.**

The Proponent supports Mayor Menino's vision to enhance water transportation options to East Boston by instituting regular water shuttle service between the South Boston and East Boston waterfronts. As such, the Boston HCA includes a contribution that will assist the City in establishing this service.

BTD 11 **In addition to considering water transport during casino operations, the City has asked the Proponent to evaluate the possibility of using water transport during Project construction for construction materials and construction workers.**

There are currently no plans to convey construction materials to the site via water transportation.

BTD 12 **As the Project advances, the Proponent will be required to develop and submit a detailed Construction Management Plan (CMP) to the BTD for review and approval. The CMP will address TDM measures for construction workers, proposed truck routes and hours, street occupancies, equipment staging, sidewalk relocations and hours of construction work.**

The Draft CMP in Attachment L addresses these items.

Boston Water and Sewer Commission

980 Harrison Avenue
Boston, MA 02119-2540

February 20, 2013

Secretary Richard K. Sullivan, Jr.
Executive Office of Energy and Environmental Affairs (EEA)
Attn: MEPA Office
100 Cambridge Street, Suite 900
Boston MA 02114

Re: Caesars Resort at Suffolk Downs
Sterling Suffolk Racecourse, LLC
East Boston and Revere

Dear Mr. Sullivan:

The Boston Water and Sewer Commission (Commission) has reviewed the Environmental Notification Form (ENF) for the Caesars Resort at Suffolk Downs located at 525 McClellan Highway in East Boston. This letter provides the Commission's comments on the ENF.

The proposed project consists of renovations to the existing grandstand, clubhouse and links, and the construction of casino areas, hotels, parking garage and retail space. The existing office building and utility buildings will also be demolished. When construction is complete, the site will have two casino areas, two hotels and a parking garage in addition to the race track and stables.

Water to the site is provided by both the Commission and the City of Revere. The connection to the Commission water distribution system is an 8" water main in Waldemar Avenue in the Commission's northern high pressure zone. A separate 4" connection to the Commission's northern low pressure zone provides water to the CAFO. Wastewater for the site discharges to the Commission sewers at two locations, The grandstands and other utility buildings discharge to a 12" sewer in Waldemer Avenue thru an existing pump station. Sewage and street drainage from the stables area is pumped from a retention and enters the Commission wastewater system via a manhole at the end of Wally Street near the MBTA station. A separate storm drainage system collects water from roof located in the stable area.

The ENF states that the proposed project will increase water consumption from approximately 40,200 gallons per day (gpd) to 435, 810 gpd and wastewater generation will increase from approximately 166,020 gpd to 473,100 gpd.

The Commission has the following comments regarding the proposed project:

General

1. The Department of Environmental Protection, in cooperation with the Massachusetts Water Resources Authority and its member communities, are implementing a coordinated approach to flow control in the MWRA regional wastewater system, particularly the removal of extraneous clean water (e.g., infiltration/ inflow (I/I)) in the system. In this regard, DEP has been routinely requiring proponents proposing to add significant new wastewater flow to assist in the I/I reduction effort to ensure that the additional wastewater flows are offset by the removal of I/I. Currently, DEP is typically using a minimum 4:1 ratio for I/I removal to new wastewater flow added. The Commission supports the DEP/MWRA policy, and will require the proponent to develop a consistent inflow reduction plan. The 4:1 requirement should be addressed at least 90 days prior to activation of water service and will be based on the estimated sewage generation provided on the project site plan. **BWSC 01**

2. All new or relocated water mains, sewers and storm drains must be designed and constructed at Sterling Suffolk Racecourse, LLC expense. They must be designed and constructed in conformance with the Commission's design standards, Water Distribution System and Sewer Use Regulations, and Requirements for Site Plans. To assure compliance with the Commission's requirements, Sterling Suffolk Racecourse, LLC must submit a site plan and a General Service Application to the Commission's Engineering Customer Service Department for review and approval when the designs of the new water and wastewater systems and the proposed service connections to those systems are 50 percent complete. The site plan should include the locations of new, relocated and existing water mains, sewers and drains which serve the site, proposed service connections as well as water meter locations. **BWSC 02**

3. It is Sterling Suffolk Racecourse, LLC responsibility to evaluate the capacity of the water, sewer and storm drain systems serving the project site to determine if the systems are adequate to meet future project demands. With the site plan, Sterling Suffolk Racecourse, LLC must include a detailed capacity analysis for the water, sewer and storm drain systems serving the project site, as well as an analysis of the impacts the proposed project will have on the Commission's water, sewer and storm drainage systems. **BWSC 03**

4. The design of the project should comply with the City of Boston's Complete Streets Initiative, which requires incorporation of "green infrastructure" into street designs. Green infrastructure includes greenscapes, such as trees, shrubs, grasses and other landscape plantings, as well as rain gardens and vegetative swales, infiltration basins, and paving materials and permeable surfaces. The proponent must develop a maintenance **BWSC 04**

plan for the proposed green infrastructure. For more information on the Complete Streets Initiative see the City's website at http://bostoncompletestreets.org/

5. Sterling Suffolk Racecourse, LLC should be aware that the US Environmental Protection Agency issued a draft Remediation General Permit (RGP) for Groundwater Remediation, Contaminated Construction Dewatering, and Miscellaneous Surface Water Discharges. If groundwater contaminated with petroleum products, for example, is encountered, Sterling Suffolk Racecourse, LLC will be required to apply for a RGP to cover these discharges. **BWSC 05**

6. The existing water use and existing sewage generation estimates do not appear to be correct. The Commission requires that these values be recalculated and submitted with the Site Plan. Sterling Suffolk Racecourse, LLC should provide separate estimates of peak and continuous maximum water demand for residential, irrigation and air-conditioning make-up water for the project. Estimates should be based on full-site build-out of the proposed project. Sterling Suffolk Racecourse, LLC should also provide the methodology used to estimate water demand for the proposed project. **BWSC 06**

Water

1. Sterling Suffolk Racecourse, LLC must provide separate estimates of peak and continuous maximum water demand for residential, irrigation of landscaped areas, and air-conditioning make-up water for the project with the site plan. Estimates should be based on full-site build-out of the proposed project. Sterling Suffolk Racecourse, LLC should also provide the methodology used to estimate water demand for the proposed project.

2. Sterling Suffolk Racecourse, LLC should explore opportunities for implementing water conservation measures in addition to those required by the State Plumbing Code. In particular, Massachusetts Convention Center Authority should consider outdoor landscaping which requires minimal use of water to maintain. If Sterling Suffolk Racecourse, LLC plans to install in-ground sprinkler systems, the Commission recommends that timers, soil moisture indicators and rainfall sensors be installed. The use of sensor-operated faucets and toilets in common areas of buildings should be considered. **BWSC 07**

3. Sterling Suffolk Racecourse, LLC is required to obtain a Hydrant Permit for use of any hydrant during the construction phase of this project. The water used from the hydrant must be metered. Sterling Suffolk Racecourse, LLC Authority should contact the Commission's Operations Division for information on and to obtain a Hydrant Permit. **BWSC 08**

4. The Commission is utilizing a Fixed Radio Meter Reading System to obtain water meter readings. For new water meters, the Commission will provide a Meter Transmitter Unit

(MTU) and connect the device to the meter. For information regarding the installation of MTUs, Sterling Suffolk Racecourse, LLC should contact the Commission's Meter installation Department.

Sewage / Drainage

1. In conjunction with the Site Plan and the General Service Application Sterling Suffolk Racecourse, LLC will be required to submit a Stormwater Pollution Prevention Plan. The plan must: **BWSC 09**

   - Identifies best management practices for controlling erosion and for preventing the discharge of sediment and contaminated groundwater or stormwater runoff to the Commission's drainage system when the construction is underway.

   - Includes a site map which shows, at a minimum, existing drainage patterns and areas used for storage or treatment of contaminated soils, groundwater or stormwater, and the location of major control or treatment structures to be utilized during construction.

   - Provides a stormwater management plan in compliance with the DEP standards mentioned above. The plan should include a description of the measures to control pollutants after construction is completed.

2. Developers of projects involving disturbances of land of one acre or more will be required to obtain an NPDES General Permit for Construction from the Environmental Protection Agency and the Massachusetts Department of Environmental Protection. Sterling Suffolk Racecourse, LLC is responsible for determining if such a permit is required and for obtaining the permit. If such a permit is required, it is required that a copy of the permit and any pollution prevention plan prepared pursuant to the permit be provided to the Commission's Engineering Customer Services Department, prior to the commencement of construction. The pollution prevention plan submitted pursuant to a NPDES Permit may be submitted in place of the pollution prevention plan required by the Commission provided the Plan addresses the same components identified in item 1 above. **BWSC 10**

3. The Commission encourages Sterling Suffolk Racecourse, LLC to explore additional opportunities for protecting stormwater quality on site by minimizing sanding and the use of deicing chemicals, pesticides, and fertilizers. **BWSC 11**

4. The discharge of dewatering drainage to a sanitary sewer is prohibited by the Commission. Sterling Suffolk Racecourse, LLC is advised that the discharge of any **BWSC 12**

dewatering drainage to the storm drainage system requires a Drainage Discharge Permit from the Commission. If the dewatering drainage is contaminated with petroleum products, Sterling Suffolk Racecourse, LLC will be required to obtain a Remediation General Permit from the Environmental Protection Agency (EPA) for the discharge.

5. Sterling Suffolk Racecourse, LLC must fully investigate methods for retaining stormwater on-site before the Commission will consider a request to discharge stormwater to the Commission's system. The site plan should indicate how storm drainage from roof drains will be handled and the feasibility of retaining their stormwater discharge on-site. Under no circumstances will stormwater be allowed to discharge to a sanitary sewer. **BWSC 13**

6. Sanitary sewage must be kept separate from stormwater and separate sanitary sewer and storm drain service connections must be provided. **BWSC 14**

7. The Commission requests that Sterling Suffolk Racecourse, LLC install a permanent casting stating "Don't Dump: Drains to Boston Harbor" next to any catch basin created or modified as part of this project. Sterling Suffolk Racecourse, LLC should contact the Commission's Operations Division for information regarding the purchase of the castings. **BWSC 15**

8. If a cafeteria or food service facility is built as part of this project, grease traps will be required in accordance with the Commission's Sewer use Regulations. Sterling Suffolk Racecourse, LLC is advised to consult with the Commission's Operations Department with regards to grease traps. **BWSC 16**

9. The enclosed floors of a parking garage must drain through oil separators into the sewer system in accordance with the Commission's Sewer Use Regulations. The Commission's Requirements for Site Plans, available by contacting the Engineering Services Department, include requirements for separators. **BWSC 17**

10. The Commission requires installation of particle separators on all new parking lots greater than 7,500 square feet in size. If it is determined that it is not possible to infiltrate all of the runoff from the new parking lot, the Commission will require the installation of a particle separator or a standard Type 5 catch basin with an outlet tee for the parking lot. Specifications for particle separators are provided in the Commission's requirements for Site Plans. **BWSC 18**

11. The Commission requires that existing stormwater and sanitary sewer service connections, which are to be re-used by the proposed project, be dye tested to confirm they are connected to the appropriate system. **BWSC 19**

Thank you for the opportunity to comment on this project.

Yours truly,

John P. Sullivan, P.E.
Chief Engineer

K. Pedersen, BRA
M. Zlody, BED
P. Larocque, BWSC

BOSTON WATER AND SEWER COMMISSION (BWSC)

BWSC 01 **The Commission supports the MassDEP/MWRA policy [to require proponents to remove infiltration/inflow (I/I) from the wastewater system using a minimum 4:1 ratio], and will require the Proponent to develop a consistent inflow reduction plan. The 4:1 requirement should be addressed at least 90 days prior to activation of water service and will be based on the estimated sewage generation provided on the Project site plan.**

The Proponent continues to work with BWSC regarding the Project and to develop mitigation strategies related to reducing water and wastewater impacts. The Proponent is committed to providing appropriate mitigation for I/I, and will pay the appropriate fees or work with BWSC to identify an appropriate project utilizing the fees to offset the increase in flows through I/I reduction (see Section 9.1)).

BWSC 02 **All new or relocated water mains, sewers and storm drains must be designed and constructed at Sterling Suffolk Racecourse, LLC expense. They must be designed and constructed in conformance with the Commission's design standards, Water Distribution System and Sewer Use Regulations, and Requirements for Site Plans. To assure compliance with the Commission's requirements, Sterling Suffolk Racecourse, LLC must submit a site plan and a General Service Application to the Commission's Engineering Customer Service Department for review and approval when the designs of the new water and wastewater systems and the proposed service connections to those systems are 50 percent complete. The site plan should include the locations of new, relocated and existing water mains, sewers and drains which serve the site, proposed service connections as well as water meter locations.**

The Proponent will provide BWSC with the required plans regarding water, sewer, and site drainage when the plans are completed.

BWSC 03 **It is Sterling Suffolk Racecourse, LLC responsibility to evaluate the capacity of the water, sewer and storm drain systems serving the project site to determine if the systems are adequate to meet future project demands. With the site plan, Sterling Suffolk Racecourse, LLC must include a detailed capacity analysis for the water, sewer and storm drain systems serving the project site, as well as an analysis of the impacts the proposed project will have on the Commission's water, sewer and storm drainage systems.**

The Proponent continues to work with BWSC to identify and mitigate any Project impacts regarding water, sewer, and storm drain systems.

BWSC 04 **The design of the project should comply with the City of Boston's Complete Streets Initiative, which requires incorporation of "green infrastructure" into street designs. Green infrastructure includes greenscapes such as trees, shrubs, grasses and other landscape plantings, as well as rain gardens and vegetative swales, infiltration basins, and paving materials and permeable surfaces. The proponent must develop a maintenance plan for the proposed green infrastructure.**

Section 4.4 describes the streetscape design and compliance with the City of Boston's Complete Streets Initiative.

BWSC 05 **Sterling Suffolk Racecourse, LLC should be aware that the US EPA issued a draft Remediation General Permit (RGP) for Groundwater Remediation, Contaminated Construction Dewatering, and Miscellaneous Surface Water Discharges. If groundwater contaminated with petroleum products, for example, is encountered, Sterling Suffolk Racecourse, LLC will be required to apply for an RGP to cover these discharges.**

The Proponent intends to comply with all applicable requirements of the Clean Water Act.

BWSC 06 **The existing water use and existing sewage generation estimates do not appear to be correct. The Commission requires that these values be recalculated and submitted with the Site Plan. Sterling Suffolk Racecourse, LLC should provide separate estimates of peak and continuous maximum water demand for residential, irrigation and air-conditioning make-up water for the Project. Estimates should be based on full site build-out of the proposed Project. Sterling Suffolk Racecourse, LLC should also provide the methodology used to estimate water demand for the proposed Project.**

The existing water use and sewage generation estimates in the ENF were developed from three years of water use records from Suffolk Downs. Therefore, the Proponent believes the estimates are accurate. An analysis was performed estimating water use and sewer discharges on an hourly basis (see Section 9.1).

BWSC 07 **Sterling Suffolk Racecourse, LLC should explore opportunities for implementing water conservation measures in addition to those required by the State Plumbing Code. In particular, Sterling Suffolk Racecourse, LLC should consider outdoor landscaping which requires minimal use of water to maintain. If Sterling Suffolk Racecourse, LLC plans to install in-ground sprinkler systems, the Commission recommends that timers, soil moisture indicators and rainfall sensors be installed. The use of sensor-operated faucets and toilets in common areas of buildings should be considered.**

Water conservation measures in addition to those required by the State Plumbing Code are planned, including rainwater harvesting (using rainwater for irrigation and other needs) and plumbing fixtures that use less water than the Code mandates (including sensor faucets, waterless urinals, and low-flow plumbing fixtures). Sections 4.4 and 4.5 describe method to minimize site irrigation as well as stormwater reuse for irrigation.

BWSC 08 **Sterling Suffolk Racecourse, LLC is required to obtain a Hydrant Permit for use of any hydrant during the construction phase of this project. The water used from the hydrant must be metered. Sterling Suffolk Racecourse, LLC should contact the Commission's Operations Division for information on and to obtain a Hydrant Permit.**

The Proponent acknowledges these requirements and will follow the necessary procedures.

BWSC 09 **In conjunction with the Site Plan and the General Service Application, Sterling Suffolk Racecourse, LLC will be required to submit a Stormwater Pollution Prevention Plan. The plan must:**

- **Identify BMPs for controlling erosion and for preventing the discharge of sediment and contaminated groundwater or stormwater runoff to the Commission's drainage system when the construction is underway;**
- **Include a site map which shows, at a minimum, existing drainage patterns and areas used for storage or treatment of contaminated soils, groundwater or stormwater, and the location of major control or treatment structures to be utilized during construction; and**
- **Provide a stormwater management plan in compliance with MassDEP standards mentioned above. The plan should include a description of the measures to control pollutants after construction is completed.**

Attachment F contains a drainage report with a draft SWPPP consistent with EPA NPDES requirements. The drainage summary also includes the locations of BMPs used on the site, existing and proposed drainage patterns, and a construction management plan. All stormwater management designs will comply with MassDEP Stormwater Management Guidelines (see Section 9.3).

BWSC 10 **Developers of projects involving disturbances of land of one acre or more will be required to obtain a NPDES General Permit for Construction from the EPA and MassDEP. Sterling Suffolk Racecourse, LLC is responsible for determining if such a permit is required and for obtaining the permit.**

The list of anticipated permits, reviews, and approvals includes a NPDES General Permit for Construction (see Table 3-1).

BWSC 11 **The Commission encourages Sterling Suffolk Racecourse, LLC to explore additional opportunities for protecting stormwater quality on site by minimizing sanding and the use of deicing chemicals, pesticides, and fertilizers.**

Sections 4.4 and 4.5 address the Proponent's intent to minimize use of chemical fertilizers.

BWSC 12 **The discharge of dewatering drainage to a sanitary sewer is prohibited by the Commission. Sterling Suffolk Racecourse, LLC is advised that the discharge of any dewatering drainage to the storm drainage system requires a Drainage Discharge Permit from the Commission.**

The Proponent acknowledges this requirement.

BWSC 13 **Sterling Suffolk Racecourse, LLC must fully investigate methods for retaining stormwater on-site before the Commission will consider a request to discharge stormwater to the Commission's system. The site plan should indicate how storm drainage from roof drains will be handled and the feasibility of retaining their stormwater discharge on-site. Under no circumstances will stormwater be allowed to discharge to a sanitary sewer.**

The Project will not discharge any stormwater to sanitary sewer lines. All stormwater generated from the site will be collected, retained, infiltrated, and reused using a combination of LID and conventional drainage techniques (see Section 9.3).

BWSC 14 **Sanitary Sewage must be kept separate from stormwater and separate sanitary sewer and storm drain service connections must be provided.**

Separate sanitary and storm drain services will be provided to the Resort.

BWSC 15 **The Commission requests that Sterling Suffolk Racecourse, LLC install a permanent casting stating "Don't Dump: Drains to Boston Harbor" next to any catch basin created or modified as part of this Project.**

The Proponent will comply with this request.

BWSC 16 **If a cafeteria or food service facility is built as part of this Project, grease traps will be required in accordance with the Commission's Sewer Use Regulations. Sterling Suffolk Racecourse, LLC is advised to consult with the Commission's Operations Department with regards to grease traps.**

Grease traps will be provided, per the plumbing code. The design team will consult with the BWSC's operations department on additional requirements, if any.

BWSC 17 The enclosed floors of a parking garage must drain through oil separators into the sewer system in accordance with the Commission's Sewer Use Regulations. The Commission's Requirements for Site Plans, available by contacting the Engineering Services Department, include requirements for separators.

The Project will provide separators, as required.

BWSC 18 The Commission requires installation of particle separators on all new parking lots greater than 7,500 square feet in size. If it is determined that it is not possible to infiltrate all of the runoff from the new parking lot, the Commission will require the installation of a particle separator or a standard Type 5 catch basin with an outlet tee for the parking lot. Specifications for particle separators are provided in the Commission's requirements for Site Plans.

Stormwater in the parking areas will be treated with a combination of traditional catch basins, particle separators, and LID BMPs. All catch basins and particle separators will comply with BWSC standards (see Section 9.3).

BWSC 19 The Commission requires that existing stormwater and sanitary sewer service connections, which are to be reused by the proposed Project, be dye-tested to confirm they are connected to the appropriate system.

The Resort will not include reuse of any sanitary or stormwater drains on site. All sanitary and storm drain systems for the Resort will be new.

RE: Environmental Notification Form – Caesars Resort at Suffolk Downs

Dear Secretary Sullivan:

The City of Revere Department of Planning and Community Development in coordination with the Mayor's Office have reviewed the above referenced Environmental Notification Form for the proposed Caesars Resort at Suffolk Downs and offer the following comments:

TRAFFIC

1. The analysis as prepared for the ENF is based on a 5-year growth horizon, with 2012 as the existing baseline, anticipating 2017 as the year of opening. This provides a MEPA level analysis, but does not provide an appropriate design level analysis. It is the City of Revere's opinion that analysis of traffic impacts should be done for a **20-year** horizon of growth from the year of opening. Also, the City requests that residual growth and any other specific developments will be considered as the analysis continues. **REV 01**

2. It is the City's opinion that the proponent's traffic consultant should further substantiate the use of a single site for trip generation purposes by providing further detail comparing the development characteristics of the Sugarhouse site in Philadelphia with the proposed project site. Also, will the enhancement of the horse racing facility cause an increase in trips not already considered within the existing racetrack volumes and Sugarhouse trip generation rate? **REV 02**

3. The proponent should further explain the use of an 18% mode share on carpool (HOV) and a 35% mode share for public transit. What will be the proponent's commitment towards implementation of the Transportation Demand Management Plan and ensure that such mode share splits would be achieved on the employee trips? **REV 03**

4. Proponent should provide further review, based on expected trip traffic, of adequacy of proposed onsite parking capacity. The City of Revere wants to be assured that parking for employees, track users, and casino users has been adequately considered and provided on site. **REV 04**

5. The City has a strong interest in providing appropriate bicycle and pedestrian routes to the site and needs to see improved pedestrian connections to the site from adjacent neighborhoods beyond the boundaries of the site. **REV 05**

6. The proponent should work closely with the MBTA on improving transit access within the site as a number of bus routes bypass the site along Revere Beach Parkway. **REV 06**

7. It should be defined how the traffic improvements proposed for the project tie into the more regional transportation improvements being proposed by MassDOT such as the widening of Route 1 from Copeland Circle to Route 99 including the Copeland Circle/Route 60 connection and Route 1 and Route 16 direct ramp connections, as well as the timing of these improvements. It is noted that the proponent has committed to Route 1/Route16 connections both northbound and southbound with new signalization and ramp widening as an intermediate improvement, as well as participating in right-of-way acquisition and design of a full, direct-access interchange from Route 16 to Route 1 northbound. **REV 07**

8. The Route 1A at Boardman Street flyover is integral to the project and removes the volume of traffic from the Boardman Street intersection, improving overall conditions there. It is the City's opinion that the proponent should review all elements of the Route 1A improvements, specifically the flyover structure for adequate intersection and stopping sight distance. The proponent should provide additional information about other concepts considered for Route 1A improvements/grade separation. This information should include at least a preliminary cost-benefit analysis of those options. **REV 08**

9. The Route 1A at Waldemar Avenue intersection is being proposed for signalization. The proponent should provide physical separation to prevent drivers from leaving Waldemar Avenue and attempting to cross 3-4 lanes of traffic to attempt a u-turn directly onto Route 1A southbound as this would create interference with through traffic to Route 1A northbound. Further, in the event there is congestion at the site drive or beyond in the northbound direction, traffic on the approach from Boardman Street or Route 1A northbound may experience congestion as the capacity between Waldemar Avenue and the site drive at Tomasello Drive fills with vehicles from the other approach. **REV 09**

10. The Route 1A/Tomasello Drive intersection is proposed as the sites main entrance. The proponent should further review the triple left turn movement required of vehicles exiting the facility and entering onto Route 1A southbound. Turning movements should be confirmed adequate for combinations of larger vehicles such as coach buses, shuttles, etc. **REV 10**

11. The proponent is committed to making improvements at the Route 1/Route 16 interchange by constructing interim geometric improvements and new signalization as presented in the ENF, as well as participating in ROW acquisition and design of a full, direct-access interchange for the Route 1 northbound approach at Route 16. It is the City's opinion that the proposed mitigation plan provides an improvement in traffic conditions at the interchange, at the Route 16/Garfield Avenue/Webster Avenue intersection, and the Route 60 corridor per the traffic analysis presented in the ENF.

12. The following intersections must be further analyzed for impact from the proposed project and shall include the following mitigation improvements: **REV 11**

Route 16/Revere Beach Parkway/Harris Street Intersection

- Design and implementation of optimal traffic signal timing and phasing at the Route 16/Revere Beach parkway/Harris Street intersection including split phasing.
- Provision of two exclusive right turn lanes eastbound onto Revere Beach Parkway.
- Implementation of pedestrian safety improvements to allow for pedestrian safe routes from Winthrop Avenue to Revere Beach Parkway in both eastbound and westbound directions including associated sidewalk reconstruction, curb ramps, crosswalks and median improvements.
- Installation of an emergency vehicle pre-emption system.

Donnelly Square **REV 12**

- The proponent's traffic consultant has not provided a complete analysis of the Donnelly Square area. The traffic study presents an analysis of the State Road/Bennington Street/Winthrop Avenue intersection only. The Bennington Street/Crescent Avenue intersection was not included in the analysis.
- The proponent should provide a detailed traffic and pedestrian circulation study of the Donnelly Square area. The limit of work for the Donnelly Square improvements should encompass the intersection of Endicott Avenue/State Road to the north, Everard Avenue/Bennington Street to the south, Washburn Avenue/Winthrop Avenue to the

west, and should also include the intersection of Winthrop Avenue/Bennington Street and Crescent Avenue/Bennington Street.

- The City has identified the following improvements within Donnelly Square: Design and implementation of an optimal traffic signal timing and phasing plan including split phasing for this intersection for the weekday morning, weekday evening, and Saturday midday peak periods; re-design intersection to channelize traffic flow on the intersection approaches; construct permanent pedestrian crosswalks with new ADA ramps at all crosswalks within the Donnelly Square area; widening of Winthrop Avenue west of Washburn Avenue to provide for the relocation of the MBTA bus stops in the eastbound and westbound lanes to accommodate bus turn-in lanes and provide for two lanes on Winthrop Avenue eastbound; aesthetic improvements including new pavement markings; landscaping improvements within the Square and along Winthrop Avenue to the site drive at Revere Beach Parkway and Tomasello Drive; and installation of an emergency vehicle pre-emption system.

North Shore Road/Revere Beach Parkway/Tomasello Drive Intersection **REV 13**

- The traffic analysis indicates LOS E and LOS F on the left turn movement exiting Tomasello Drive during the Friday P.M. and Saturday P.M. peak hour conditions respectively under build and mitigation. The proponent should address this issue and mitigate the deterioration in level of service.

- The City has identified the following improvements: design and implementation of optimal traffic signal timing at the intersection of North Shore Road and Revere Beach Parkway including split phasing to accommodate increased traffic movements associated with the resort casino; evaluation of alternatives for the provision of an exclusive right hand turning lane into the Tomasello site drive; pedestrian safety measures at the intersection and along Revere Beach Parkway including traffic median improvements and potential realignment; and the installation of an emergency vehicle pre-emption system.

Mahoney Circle **REV 14**

- Design and implementation of a comprehensive upgrade of the signs within Mahoney Circle consistent with the MUTCD standards to improve pedestrian guidance and safety.

- Installation of ADA accessible ramps and associated sidewalk and median upgrade improvements within and around the circle.

- Implement channelization and signalization improvements in coordination with MassDOT.

- Design and implementation of a comprehensive upgrade of the signs and pavement markings approaching and within Mahoney Circle consistent with the MUTCD standards to improve motorist guidance and safety.

- Upgrade the traffic islands within the circle to include new curbing and landscaping.

- Installation of an emergency vehicle pre-emption system.

Brown Circle **REV 15**

- Design and implementation of a comprehensive upgrade of the signs within Brown Circle consistent with the MUTCD standards to improve pedestrian guidance and safety.

- Installation of ADA accessible ramps.

- Design and implementation of channelization and signalization improvements in coordination with MassDOT including new pavement and directional markings and channelization islands at the Route 107 northbound approach to the circle.

- Design and implementation of a comprehensive upgrade of the signs and pavement markings approaching and within Mahoney Circle consistent with the MUTCD standards to improve motorist guidance and safety.

- Geometric and channelization improvements by extending existing islands and installing new islands to facilitate traffic flow in a safe manner.

Route 60/Revere Street Intersection **REV 16**

- The Lower North Shore Transportation Improvement Study identifies a recommended improvement for the Route 60/Revere Street intersection. This improvement should be further discussed with MassDOT relative to a timeline for its implementation. The proponent should present additional analysis to determine if the recommended improvement plan would address operational issues with the project generated traffic in place.

- Design and implementation of an optimal signal timing and phasing plan.

- Implement pedestrian safety improvements including new crosswalks and ADA accessible ramps with associated sidewalk reconstruction.

- Installation of an emergency vehicle pre-emption system.

Copeland Circle/Route 1 Improvements **REV 17**

- The Lower North Shore Transportation Improvement Study identifies a recommended improvement for the Copeland Circle intersection. This improvement should be further discussed with MassDOT relative to a timeline for its implementation by MassDOT. The proponent should present additional analysis to determine if the recommended improvement plan would address operational issues with the project generated traffic.

13. In addition to the aforementioned traffic improvements recommended by the City, the City will rely upon MassDOT to identify appropriate scope and study elements on State-owned roadways through the MEPA process to include: appropriate study of potentially affected intersections, appropriate study of alternatives, 20-year growth horizon, reasonable mitigation efforts and follow up. **REV 18**

14. The City is requesting that the MEPA process clearly define scope and schedule of proposed traffic mitigation and improvements as well as who will be responsible for the funding and implementation. **REV 19**

ENVIRONMENT

1. The cumulative induced traffic impacts of the proposed project in an already congested ozone nonattainment area could be significant. Therefore, a detailed analysis of the associated effects on local air quality should be included in the DEIR. **REV 20**

2. A traffic management plan should be outlined in the DEIR regarding the management of existing pedestrian and traffic operations during construction activities both on site and off site. **REV 21**

3. The landscaping and streetscape improvements along the Revere Beach Parkway and Winthrop Avenue border of the site should be further defined in the DEIR along with a more detailed plan for streetscape improvements within the Donnelly Square area. **REV 22**

4. Sales Creek and Green Creek are major stormwater drainage collectors for the City of Revere and dissect the Suffolk Downs property with discharge into the Belle Isle Marsh ACEC. It is important that the DEIR outline a stormwater management plan and pollutant abatement measures to be undertaken within the Suffolk Downs property and proposed parking areas. It is also recommended that a maintenance plan be provided in the DEIR that ensures the design flow capacity of these creeks and downstream drainage system, including the prevention of silt and sand from entering these drainage channels from both the parking lot areas and track infield. **REV 23**

5. The DEIR should summarize the impacts on the City of Revere water, sewer and drainage system that may arise as a result of the full build out of the project including any planned improvements proposed for the parking lot and stable area located in Revere and the DEIR should describe how those impacts will be mitigated. **REV 24**

6. The DEIR should detail how post construction solid waste management and recycling will be handled as well as the abatement of asbestos and lead paint. **REV 25**

7. The ENF mentions that onsite storage of hazardous materials or toxic chemicals during construction will be limited to what is absolutely necessary. The proponent should discuss the nature of these materials in the DEIR and the manner in which they will be removed as well as spill prevention and control procedures, especially for construction equipment and vehicles. **REV 26**

8. The DEIR should address the appropriate removal of hazardous soils within the site and describe in detail an erosion control and sedimentation control plan for the proposed parking lot areas adjacent to Sales Creek and tributary drainage ditches during construction. **REV 27**

Respectfully,

Frank Stringi

Frank Stringi
DPCD Director

C: Mayor Dan Rizzo
Revere City Council
John Festa, Economic Development Director

CITY OF REVERE (REV)

REV 01 **The [transportation] analysis as prepared for the ENF is based on a 5-year growth horizon, with 2012 as the existing baseline, anticipating 2017 as the year of opening. This provides a MEPA-level analysis, but does not provide an appropriate design level analysis. It is the City of Revere's opinion that analysis of traffic impacts should be done for a 20-year horizon of growth from the year of opening. Also, the City requests that residential growth and any other specific developments will be considered as the analysis continues.**

The DEIR/EPNF traffic analysis horizon year is 2022. For Route 1A infrastructure improvement alternatives, a design year 2032 analysis is included. Both of these dates have been requested by MassDOT. In addition to regional growth, specific developments as requested by the cities of Revere and Boston have been considered in the future year projections.

REV 02 **It is the City's opinion that the Proponent's traffic consultant should further substantiate the use of a single site for trip generation purposes by providing further detail comparing the development characteristics of the Sugarhouse site in Philadelphia with the proposed Project site. Also, will the enhancement of the horse racing facility cause an increase in trips not already considered within the existing racetrack volumes and Sugarhouse trip generation rate?**

The trip generation analysis in Section 5.4 is based on extensive research of proprietary data, other studies, and actual counts performed by the Proponent at comparable locations, two of which include racetracks.

REV 03 **The Proponent should further explain the use of an 18% mode share on carpool (HOV) and a 35% mode share for public transit. What will be the Proponent's commitment towards implementation of the TDM plan to ensure that such mode share splits would be achieved on the employee trips?**

The derivation of mode shares is described in detail in Section 5.4.5. The Proponent is committed to a comprehensive TDM plan, presented in Section 5.9, which includes monitoring elements.

REV 04 **The Proponent should provide further review, based on expected trip traffic, of adequacy of proposed onsite parking capacity. The City of Revere wants to be assured that parking for employees, track users, and casino users has been adequately considered and provided on site.**

The parking analysis is presented in Section 5.10.

REV 05 **The City has a strong interest in providing appropriate bicycle and pedestrian routes to the site and needs to see improved pedestrian connections to the site from adjacent neighborhoods beyond the boundaries of the site.**

The Proponent has committed to roadway and safety improvements in the City of Revere HCA, many of which include bicycle and pedestrian enhancements both remote from and close to the Project site.

REV 06 **The Proponent should work closely with the MBTA on improving transit access within the site as a number of bus routes bypass the site along Revere Beach Parkway.**

The Proponent has committed to provide an MBTA bus stop on the Project site, should the MBTA wish to route bus service through the site.

REV 07 **It should be defined how the traffic improvements proposed for the Project tie into the more regional transportation improvements being proposed by MassDOT such as the widening of Route 1 from Copeland Circle to Route 99 including the Copeland Circle/Route 60 connection and Route 1 and Route 16 direct ramp connections, as well as the timing of these improvements.**

The roadway and traffic improvements committed to in the City of Revere HCA are consistent with regional improvements planned or being considered by MassDOT.

REV 08 **The Route 1A at Boardman Street flyover is integral to the Project and removes the volume of traffic from the Boardman Street intersection, improving overall conditions there. It is the City's opinion that the Proponent should review all elements of the Route 1A improvements, specifically the flyover structure, for adequate intersection and stopping sight distance. The Proponent should provide additional information about other concepts considered for Route 1A improvements/grade separation. This information should include at least a preliminary cost-benefit analysis of those options.**

An alternatives analysis of options for the Route 1A improvements is presented in Section 5.5. Design development of any concept will comply with all appropriate MassDOT design standards.

REV 09 **The Route 1A at Waldemar Avenue intersection is being proposed for signalization. The Proponent should provide physical separation to prevent drivers from leaving Waldemar Avenue and attempting to cross 3-4 lanes of traffic to attempt a U-turn directly onto Route 1A southbound, as this would create interference with through-traffic to Route 1A northbound. Further, in the event there is congestion at the site drive or beyond in the northbound direction, traffic on the approach from**

Boardman Street or Route 1A northbound may experience congestion as the capacity between Waldemar Avenue and the site drive at Tomasello Drive fills with vehicles from the other approach.

The physical prevention of U turns on Route 1A from Waldemar Avenue can be accommodated in the design. The analysis presented in Section 5.5 indicates that the section between Boardman Street, Waldemar Avenue, and Tomasello Drive will have adequate capacity.

REV 10 The Route 1A/Tomasello Drive intersection is proposed as the site's main entrance. The Proponent should further review the triple left-turn movement required of vehicles exiting the facility and entering onto Route 1A southbound. Turning movements should be confirmed adequate for combinations of larger vehicles such as coach buses, shuttles, etc.

This issue will be addressed in the design development of the concept plan in coordination with MassDOT. The Project driveway will be designed to accommodate large vehicles.

REV 11 [Route 16/Revere Beach Parkway/Harris Street intersection] must be further analyzed for impact from the proposed Project and shall include the following mitigation improvements:

- Design and implementation of optimal traffic signal timing and phasing... including split phasing.
- Provision of two exclusive right turn lanes eastbound onto Revere Beach Parkway.
- Implementation of pedestrian safety improvements to allow for pedestrian safe routes from Winthrop Avenue to Revere Beach Parkway in both eastbound and westbound directions including associated sidewalk reconstruction, curb ramps, crosswalks and median improvements.
- Installation of an emergency vehicle pre-emption system.

Improvements at this location are included in the City of Revere HCA (see Section 5.6).

REV 12 [Donnelly Square] must be further analyzed for impact from the proposed Project and shall include the following mitigation improvements:

- The Proponent's traffic consultant has not provided a complete analysis of the Donnelly Square area. The traffic study presents an analysis of the State Road/Bennington Street/Winthrop Avenue intersection only. The Bennington Street/Crescent Avenue intersection was not included in the analysis.

- The Proponent should provide a detailed traffic and pedestrian circulation study of the Donnelly Square area. The limit of work for the Donnelly Square improvements should encompass the intersection of Endicott Avenue/State Road to the north, Everard Avenue/Bennington Street to the south, Washburn Avenue/Winthrop Avenue to the west, and should also include the intersection of Winthrop Avenue/Bennington Street and Crescent Avenue/Bennington Street.
- The City has identified the following improvements within Donnelly Square: Design and implementation of an optimal traffic signal timing and phasing plan, including split phasing for this intersection for the weekday morning, weekday evening, and Saturday midday peak periods; re-design intersection to channelize traffic flow on the intersection approaches; construct permanent pedestrian crosswalks with new ADA ramps at all crosswalks within the Donnelly Square area; widening of Winthrop Avenue west of Washburn Avenue to provide for the relocation of the MBTA bus stops in the eastbound and westbound lanes to accommodate bus turn-in lanes and provide for two lanes on Winthrop Avenue eastbound; aesthetic improvements including new pavement markings; landscaping improvements within the Square and along Winthrop Avenue to the site drive at Revere Beach Parkway and Tomasello Drive; and installation of an emergency vehicle pre-emption system.

The Crescent Avenue intersection has been included in the traffic analysis presented in Section 5.7. Improvements at Donnelly Square and on Winthrop Avenue are included in the City of Revere HCA (see Section 5.6).

REV 13 [North Shore Road/Revere Beach Parkway/Tomasello Drive intersection] must be further analyzed for impact from the proposed Project and shall include the following mitigation improvements:

- The traffic analysis indicates LOS E and LOS F on the left turn movement exiting Tomasello Drive during the Friday PM and Saturday PM peak hour conditions, respectively, under build and mitigation. The Proponent should address this issue and mitigate the deterioration in level of service.
- The City has identified the following improvements: design and implementation of optimal traffic signal timing at the intersection of North Shore Road and Revere Beach Parkway including split phasing to accommodate increased traffic movements associated with the resort casino; evaluation of alternatives for the provision of an exclusive right hand turning lane into the Tomasello site drive; pedestrian safety measures at the intersection and along Revere Beach Parkway, including traffic median improvements and potential realignment; and the installation of an emergency vehicle pre-emption system.

Improvements at Tomasello Drive and North Shore Road are included in the City of Revere HCA (see Section 5.6).

REV 14 [Mahoney Circle] must be further analyzed for impact from the proposed Project and shall include the following mitigation improvements:

- Design and implementation of a comprehensive upgrade of the signs within Mahoney Circle consistent with the MUTCD standards to improve pedestrian guidance and safety.
- Installation of ADA accessible ramps and associated sidewalk and median upgrade improvements within and around the circle.
- Implement channelization and signalization improvements in coordination with MassDOT.
- Design and implementation of a comprehensive upgrade of the signs and pavement markings approaching and within Mahoney Circle consistent with the MUTCD standards to improve motorist guidance and safety.
- Upgrade the traffic islands within the circle to include new curbing and landscaping.
- Installation of an emergency vehicle pre-emption system.

Improvements at Mahoney Circle are included in the City of Revere HCA (see Section 5.6).

REV 15 [Brown Circle] must be further analyzed for impact from the proposed Project and shall include the following mitigation improvements:

- Design and implementation of a comprehensive upgrade of the signs within Brown Circle consistent with the MUTCD standards to improve pedestrian guidance and safety.
- Installation of ADA accessible ramps.
- Design and implementation of channelization and signalization improvements in coordination with MassDOT including new pavement and directional markings and channelization islands at the Route 107 northbound approach to the circle.
- Design and implementation of a comprehensive upgrade of the signs and pavement markings approaching and within Mahoney Circle consistent with the MUTCD standards to improve motorist guidance and safety.
- Geometric and channelization improvements by extending existing islands and installing new islands to facilitate traffic flow in a safe manner.

Improvements at Brown Circle are included in the City of Revere HCA (see Section 5.6).

REV 16 [Route 60/Revere Street Intersection] must be further analyzed for impact from the proposed Project and shall include the following mitigation improvements:

- The Lower North Shore Transportation Improvement Study identifies a recommended improvement for the Route 60/Revere Street intersection. This improvement should be further discussed with MassDOT relative to a timeline for its implementation. The Proponent should present additional analysis to determine if the recommended improvement plan would address operational issues with the Project-generated traffic in place.
- Design and implementation of an optimal signal timing and phasing plan.
- Implement pedestrian safety improvements including new crosswalks and ADA accessible ramps with associated sidewalk reconstruction.
- Installation of an emergency vehicle pre-emption system.

Improvements at the Revere Street/Route 60 intersection are included in the City of Revere HCA (see Section 5.6).

REV 17 [Copeland Circle/Route 1 improvements] must be further analyzed for impact from the proposed Project and shall include the following mitigation improvements:

- The Lower North Shore Transportation Improvement Study identifies a recommended improvement for the Copeland Circle intersection. This improvement should be further discussed with MassDOT relative to a timeline for its implementation by MassDOT. The Proponent should present additional analysis to determine if the recommended improvement plan would address operational issues with the Project-generated traffic.

An analysis of Project impacts at Copeland Circle is presented in Section 5.7.

REV 18 In addition to the aforementioned traffic improvements recommended by the City, the City will rely upon MassDOT to identify appropriate scope and study elements on State-owned roadways through the MEPA process to include: appropriate study of potentially affected intersections, appropriate study of alternatives, 20-year growth horizon, reasonable mitigation efforts and follow up.

The DEIR/EPNF analysis is responsive to MassDOT's comments on the ENF, and the study area includes all additional locations requested by MassDOT, MBTA, and the cities of Revere and Boston.

REV 19 **The City is requesting that the MEPA process clearly define scope and schedule of proposed traffic mitigation and improvements as well as who will be responsible for the funding and implementation.**

Section 10.0 includes proposed Section 61 Findings intended to define the scope, schedule, and responsibilities for the proposed traffic and roadway improvements based on the HCA.

REV 20 **The cumulative induced traffic impacts of the proposed Project in an already-congested ozone non-attainment area could be significant. Therefore, a detailed analysis of the associated effects on local air quality should be included in the DEIR.**

The methodology and results of the mesoscale analysis are presented in Sections 6.5.4.1 and 6.5.5.1, respectively. The methodology and results of the microscale analysis are presented in Sections 6.5.4.2 and 6.5.5.2, respectively.

REV 21 **A traffic management plan should be outlined in the DEIR regarding the management of existing pedestrian and traffic operations during construction activities both on site and off site.**

The Draft CMP in Attachment L describes construction-period management, including traffic management and pedestrian access.

REV 22 **The landscaping and streetscape improvements along the Revere Beach Parkway and Winthrop Avenue border of the site should be further defined in the DEIR along with a more detailed plan for streetscape improvements within the Donnelly Square area.**

Section 4.3.6 describes the Winthrop Avenue streetscape design. Improvements at Donnelly Square are included in the City of Revere HCA (see Section 5.6).

REV 23 **Sales Creek and Green Creek are major stormwater drainage collectors for the City of Revere and dissect the Suffolk Downs property with discharge into the Belle Isle Marsh ACEC. It is important that the DEIR outline a stormwater management plan and pollutant abatement measures to be undertaken within the Suffolk Downs property and proposed parking areas. It is also recommended that a maintenance plan be provided in the DEIR that ensures the design flow capacity of these creeks and downstream drainage system, including the prevention of silt and sand from entering these drainage channels from both the parking lot areas and track infield.**

The Project will significantly improve stormwater management relative to the existing system, and stormwater in the parking areas will be treated with a combination of traditional catch basins, particle separators, and LID BMPs consistent with BWSC standards and the State Stormwater Guidelines (see Section 9.3).

REV 24 **The DEIR should summarize the impacts on the City of Revere water, sewer, and drainage system that may arise as a result of the full build out of the Project including any planned improvements proposed for the parking lot and stable area located in Revere and the DEIR should describe how those impacts will be mitigated.**

The Project will have minimal impacts to Revere's water, sewer, and drain systems, as Resort buildings will be serviced by the City of Boston. All stormwater will be collected, treated, and discharged to Sales Creek or to wetland systems draining to Sales Creek, improving the performance of that drainage feature, which services various Revere neighborhoods. Section 9.0 contains discussions of the Resort's wastewater, water supply, and stormwater management systems.

REV 25 **The DEIR should detail how post construction solid waste management and recycling will be handled as well as the abatement of asbestos and lead paint.**

Materials handling, including asbestos-containing materials and lead-based paint, is addressed in the Draft CMP in Attachment L.

REV 26 **The ENF mentions that onsite storage of hazardous materials or toxic chemicals during construction will be limited to what is absolutely necessary. The Proponent should discuss the nature of these materials in the DEIR and the manner in which they will be removed as well as spill prevention and control procedures, especially for construction equipment and vehicles.**

A draft spill response plan, predominantly governing refueling activities, is provided in the Draft CMP in Attachment L. It is not anticipated that any significant volumes of hazardous materials or toxic chemicals will be stored on-site during construction; however, if small quantities of such materials storage becomes necessary, the contractor will obtain all required approvals.

REV 27 **The DEIR should address the appropriate removal of hazardous soils within the site and describe in detail an erosion control and sedimentation control plan for the proposed parking lot areas adjacent to Sales Creek and tributary drainage ditches during construction.**

It is the Proponent's intent to keep and re-use excavated materials on-site. Excavated soils will be stockpiled and managed in accordance with typical practice (i.e., segregation, stockpiling) as well as applicable regulations and legal requirements. If hazardous soil materials are encountered on site that cannot be reused, they will be handled, transported and disposed of in accordance with all state and federal requirements. A draft SWPPP has been included along with a

drainage report (see Attachment F). The draft SWPPP was prepared in compliance with the U.S. EPA NPDES program and, along with the Erosion and Sedimentation Control Plans, describe erosion and sedimentation protection for the Project. The SWPPP will be further refined as design progresses.

COMMONWEALTH OF MASSACHUSETTS
THE GENERAL COURT
STATE HOUSE, BOSTON 02133-1053

March 20, 2013

Executive Office of Energy and Environmental Affairs
MEPA Office
100 Cambridge Street, Suite 900
Boston, MA 02114

To Whom It May Concern:

The proposed resort casino at Suffolk Downs is the most important land use decision for East Boston and Revere since the expansion of Logan Airport in the 1960's and 1970's. Residents of these host communities will be voting as to whether or not they support the Caesars Resort at Suffolk Downs in the near future. As such, it is imperative to provide a great amount of detail and clarity in every aspect of the proposal. To do so ensures that the citizens of East Boston and Revere make a well-informed decision when they vote in the referendum. It is in this spirit that we ask for a number of items included in the Early Notification Form ("ENF") to be expanded upon in the Draft Environmental Impact Report ("DEIR").

Suffolk Downs has proposed a series of transportation infrastructure improvements, most notably the "Boardman Street Flyover" and a connection onto Route 1 North via Route 16 West. While these are improvements that we strongly support, questions still remain as to what the proposals will mean for host communities. For example, how will the weekday morning and evening commutes change? Will the proposed "Boardman Street Flyover" make the morning drive to the Harbor Tunnels less time-consuming for East Boston and Winthrop residents? How will the proposed Route 1 North Connection on Route 16 impact the northbound commute through Revere? Will the proposed widening of Route 1A South improve the southbound morning commute on Route 1A for Revere residents? **PBL 01**

These are just a few questions that the current ENF leaves unanswered. To help residents more fully understand and appreciate the new roads, greater specificity regarding the traffic count analysis, as well as a three-dimensional or digital model depicting the proposed improvements, are necessary in the DEIR. **PBL 02**

Additionally, the proposed development will have buildings as high as 165 feet. With residential properties nearby, the DEIR must include a detailed shadow analysis for the surrounding neighborhoods. PBL 03

Finally, the applicant concludes on page seven of the ENF that "environmental impacts from the Project will be less than the impacts of any reasonably-sized development alternative at the site." While we believe that to be the case, it is incumbent upon the applicant to convince residents that a resort casino is the better alternative to the other potential developments; namely by explaining in greater detail how that conclusion was reached. The DEIR should also include examples beyond the mixed-use development currently referenced in a one page summary in the ENF. PBL 04

We have expressed conditioned support for the project in the past, pending both a more fulsome analysis of the public benefits in the ENF, as well as the benefits that will be part of the proponent's Host and Surrounding Community Agreements.

Thank you for your consideration and if you should have questions, please do not hesitate to contact us.

Sincerely,

ANTHONY PETRUCCELLI
State Senator

CARLO BASILE
State Representative

SALVATORE LaMATTINA
Boston City Councilor

STATE SENATOR PETRUCCELLI; STATE REPRESENTATIVE BASILE; BOSTON CITY COUNCILOR LAMATTINA

PBL 01 **Suffolk Downs has proposed a series of transportation infrastructure improvements, most notably the "Boardman Street Flyover" and a connection onto Route 1 North via Route 16 West. While these are improvements that we strongly support, questions still remain as to what the proposals will mean for host communities. For example, how will the weekday morning and evening commutes change? Will the proposed "Boardman Street Flyover" make the morning drive to the Harbor Tunnels less time-consuming for East Boston and Winthrop residents? How will the proposed Route 1 North connection on Route 16 impact the northbound commute through Revere? Will the proposed widening of Route 1A South improve the southbound morning commute on Route 1A for Revere residents?**

A detailed traffic operations analysis is presented in Section 5.5 for the proposed Route 1A infrastructure improvement alternatives and in Section 5.7 for all other study area locations.

PBL 02 **To help residents more fully understand and appreciate the new roads, greater specificity regarding the traffic count analysis, as well as a three-dimensional or digital model depicting the proposed improvements, are necessary in the DEIR.**

A detailed traffic operations analysis is presented in Section 5.5 for the Route 1A infrastructure improvement alternatives. A three-dimensional model of the flyover solution (Option 4) advocated by the Proponent for the community was displayed at a series of community open houses hosted by the Proponent at Suffolk Downs and other locations in East Boston and Revere during the spring 2013.

PBL 03 **With residential properties nearby, the DEIR must include a detailed shadow analysis for the surrounding neighborhoods.**

A comprehensive shadow analysis is provided in Section 6.2.

PBL 04 **The applicant concludes on page seven of the ENF that "environmental impacts from the Project will be less than the impacts of any reasonably-sized development alternative at the site." While we believe that to be the case, it is incumbent upon the applicant to convince residents that a resort casino is the better alternative to the other potential developments, namely by explaining in greater detail how that conclusion was reached. The DEIR should also include examples beyond the mixed-use development currently referenced in a one page summary in the ENF.**

Section 1.9 evaluates alternative development options for the Project site. These options include two mixed use alternatives that would contain a mix of retail, office, and residential uses.

City of Malden
Massachusetts

Gary Christenson, Mayor
mayor@cityofmalden.org
www.cityofmalden.org

OFFICE OF THE MAYOR
200 Pleasant Street, Room 627

March 25, 2013

Secretary Richard K. Sullivan
Executive Office of Energy & Environmental Affairs
Attn: MEPA Office
100 Cambridge Street, Suite 900
Boston, MA 02114

RE: Environmental Notification Form—Caesars Resort at Suffolk Downs

Dear Secretary Sullivan:

On behalf of the City of Malden, I appreciate this opportunity to make public comment on the Environmental Notification Form (ENF) filed by Caesars Resort at Suffolk Downs.

Of particular concern to Malden, at this point in the process, is the ultimate traffic mitigation plan that will be developed in conjunction with this major redevelopment proposal. While the proponent acknowledges in the ENF that it will need to undertake a full-blown analysis of traffic issues both in the area proximate to the redevelopment site as well as in the region, I would strongly suggest that any traffic plan that is developed should take into account and incorporate the long-needed improvements to both the Route One Corridor and to Wellington Circle. **MLD 01**

The Route One Transportation Improvement Project (Malden, Revere and Saugus) as well as the need to make significant improvements to Wellington Circle to unlock the redevelopment potential in this area have been high priority projects on the Commonwealth of Massachusetts Transportation Improvement Plan (TIP) for many years. As a surrounding community, Malden supports prudent redevelopment, but believes that these two high priority highway projects cannot be overlooked by the developer or the Commonwealth when the time comes to undertake the more extensive traffic mitigation study. Not only would these highway improvement projects improve the flow of traffic in these areas, but they would also eliminate a lot of traffic congestion that occurs even today in Malden's residential neighborhoods that abut portions of these highway corridors. **MLD 02**

If you would like to address Malden's concerns in greater detail, I can be reached at 781-397-7000, ext. 2000 or by email at mayor@cityofmalden.org.

Sincerely,

GARY CHRISTENSON
Mayor

MAYOR CHRISTENSON, MALDEN

MLD 01 **I would strongly suggest that any traffic plan that is developed should take into account and incorporate the long-needed improvements to both the Route 1 Corridor and to Wellington Circle.**

The traffic analysis performed for the DEIR/EPNF and presented in Section 5.7 does not identify significant Project impacts in the Route 1 Corridor or at Wellington Circle. However, the Proponent has proposed improvements at the Route 1/Route 16 interchange to assist in regional traffic movements and is supportive any improvements planned or under consideration for Route 1 and for Wellington Circle by the Commonwealth. The proposed improvements for Route 1 and Route 16 are consistent with future plans in the Copeland Circle area.

MLD 02 **Malden supports prudent redevelopment, but believes that [the Route One Transportation Improvement Project (Malden, Revere and Saugus) as well as the need to make significant improvements to Wellington Circle] cannot be overlooked by the developer or the Commonwealth when the time comes to undertake the more extensive traffic mitigation study.**

Please see the response to MLD 01.

HOST COMMUNITY ADVISORY COMMITTEE

City Hall, Room 615 Boston MA 02201

HCAC

Brian Leary, *Chairman*
Sarah Barnat
Lisa Calise
David Fubini
Ronald L. Walker II

March 20, 2013

Dear East Boston Community:

The Host Community Advisory Committee would like to share with you some of the City's assessments and recommendations of the environmental review of the proposed development at Suffolk Downs. In January Suffolk Downs submitted an Environmental Notification Form to the state. This is an important step in the process of reviewing the development, and ensuring that the development works for the community. The City has assembled a specialized team of City officials, independent consultants and subject matter experts to review this filing and the overall development. Included below are a series of requests and recommendations related to the environmental filing that the City is analyzing. We encourage the state to also consider them in its environmental review process.

The City and the community agree that traffic and transportation are a priority. With that in mind, the City is applying the highest standards to the developer's transportation plans, and asks that state do the same. The City has requested, and we recommend that the state also request from the developer:

- A detailed impact assessment and recommendations to protect the community from any potential impact; **HCAC 01**
- A detailed analysis of vehicular, pedestrian, bicycle and boat access connections to the site; **HCAC 02**
- An analysis on the MBTA, including availability of service and station improvements; **HCAC 03**
- An overall comprehensive parking study; and **HCAC 04**
- A detailed construction management and demand management plan. **HCAC 05**

As a leader in environmental sustainability and energy efficiency, the City is encouraged by Suffolk Downs' pledge for a particularly green development, including new plans to reduced pavement by 30% and transform current asphalt in to natural landscape. At the same time, the City has very high environmental standards. Therefore, the City asks that the state also request from the developer environmental material and studies in many areas, including the following:

- Detailed consideration of energy and water conservation and alternative energy measures; **HCAC 06**
- Use of sustainable building materials; **HCAC 07**
- Detailed evaluation of local and regional air quality impacts, and information on soil and hazardous materials; **HCAC 08**
- Information on stormwater management, sea level rise, and storm surge preparedness. **HCAC 09**
- In all of these areas, the City suggests that the developer consider impacts for the construction period as well as future effects.

Finally, we want to reiterate that the City's critique of the Environmental Notification Form is one of many reviews of the overall development, all of which are improved by community engagement and feedback. We look forward to continuing to work with the community and the state throughout this process.

Sincerely,

Elizabeth Dello Russo, Esquire
Executive Director, Host Community Advisory Committee

HOST COMMUNITY ADVISORY COMMITTEE

HCAC 01 **[We recommend that the state also request] a detailed impact assessment and recommendations to protect the community from any potential impact.**

This document is a comprehensive analysis of potential Project impacts and mitigation measures proposed to avoid and minimize those impacts.

HCAC 02 **[We recommend that the state also request] a detailed analysis of vehicular, pedestrian, bicycle and boat access connections to the site;**

Section 5.0 includes detailed analysis of vehicular, pedestrian and bicycle access to the Project site. Attachment C contains a water transportation analysis.

HCAC 03 **[We recommend that the state also request] an analysis on the MBTA, including availability of service and station improvements.**

Sections 5.2.1 and 5.8.1 include analyses of MBTA service and operations for existing and Build conditions, respectively.

HCAC 04 **[We recommend that the state also request] an overall comprehensive parking study.**

A parking study for the Project is presented in Section 5.10.

HCAC 05 **[We recommend that the state also request] a detailed construction management and demand management plan.**

The Draft CMP in Attachment L addresses construction-period activities.

HCAC 06 **[The City asks that the state also request, for construction period and future effects,] detailed consideration of energy and water conservation and alternative energy measures.**

Water conservation measures incorporated into the Project design are identified in Section 9.2.3, and alternative energy measures are described in Section 9.5.

HCAC 07 **[The City asks that the state also request] use of sustainable building materials.**

Section 2.0 describes the Project's sustainable design.

HCAC 08 **[The City asks that the state also request, for construction period and future effects,] detailed evaluation of local and regional air quality impacts, and information on soil and hazardous materials.**

Construction-period air quality considerations and handling of soils and materials are described in the Draft CMP in Attachment L. An air quality analysis based on Project design is provided in Section 6.5.

HCAC 09 **[The City asks that the state also request, for construction period and future effects,] information on stormwater management, sea level rise, and storm surge preparedness.**

Section 2.3 contains a discussion of climate change and adaptation; Section 9.3 describes proposed stormwater management.

To: Buckley, Deirdre (EEA)
Subject: EEA No.15006.

Dear Ms. Buckley,

I am writing to express my concerns regarding the environmental impact of the proposed casino at Suffolk Downs. I have been a resident of the Eagle Hill neighborhood of East Boston for over ten years, and despite its flaws, like persistent litter and the lack of real political leadership to address what matters most to residents, I really love this neighborhood and am committed to protecting the values that set us apart and make East Boston such a great place to live.

I strongly believe that locating a predatory gambling establishment in a residential, densely populated working class neighborhood is a very bad idea.

Some of my major concerns include:

- Increased traffic and related pollution **ANT 01**
- Increased crime
- Increased drug use and alcoholism
- Increased foreclosures due to problem gamblers
- Lower property values
- Higher insurance rates
- Fewer local businesses that do not support the casino interests

Repeated studies have demonstrated all of these negative effects on neighborhoods that house casinos and I don't think any amount of mitigation can justify bringing this into our community. East Boston already has to deal with a large airport and two tunnels. It is a bad idea that should be stopped.

I can understand why casino owners want to develop Suffolk Downs into a casino – they stand to make a killing off the backs of the working poor. But I think it's really irresponsible that the elected officials in the Commonwealth support this idea on the basis on the creation of low wage jobs, with full knowledge of all the negative effects expanded gambling will bring.

Thank you for your time.

Sincerely,
John Antonellis, Lead Instructor
Harvard Bridge Program, Center for Workplace Development

ANTONELLIS, JOHN

ANT 01 Some of my concerns include:

- Increased traffic and related pollution;
- Increased crime;
- Increased drug use and alcoholism;
- Increased foreclosures due to problem gamblers;
- Lower property values;
- Higher insurance rates; and
- Fewer local businesses that do not support the casino interests.

The Expanded Gaming Act requires applicants for a gaming license to prepare and submit studies regarding the impacts of casino development. As part of the Host Community Agreement negotiations for the Project, the City of Boston asked the Proponent to advance the timeline for these required studies and, in July and August of 2012, the Proponent provided the City with several studies responsive to these requests. These independent, third-party studies prepared at the Proponent's expense address the impacts of a potential casino development on insurance and property values, as well as the social impacts such as crime, addiction, and problem gaming.

Re: EEA # 15006
Caesars Resort at Suffolk Downs Project
Environmental Notification Form (ENF)

Dear Ms. Buckley:

I am writing as a life-long resident of Winthrop, MA. As I am not opposed to a Casino at Suffolk Downs as it will help our economy and bring jobs hopefully to the surrounding communities; however, I have serious reservations about the traffic problem at the intersection of Route 1A/Boardman Street.

As I write this comment letter today (during the snow storm), traffic leaving Winthrop today was horrendous. Winthrop has two ways out of town, through East Boston or Revere. The Revere exit was closed due to the major flooding on the Winthrop/Revere Parkway. It took the residents of Winthrop over one hour to get as far as Orient Heights in East Boston (which on a good day is probably a five-minute commute) because no one thought to have a police detail at the intersection of Pleasant and Main Street in Winthrop or a Boston Police Officer or State Police Officer at Orient Heights to help with the traffic nightmare during the morning rush hour.

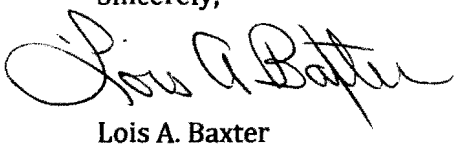
However, the real traffic problem for Winthrop and East Boston residents is the Route 1A/Boardman Street intersection where traffic can back up. Winthrop residents have been complaining for years about this traffic problem but no one does anything or seems to care. MassPort pays for a State Police Detail at this intersection but he causes ***MAJOR TRAFFIC*** problems because he just sits in his car and lets all the traffic run on Route 1A and forgets about the Boardman Street traffic. (I recently sat in traffic on Boardman Street for over 10 minutes before he changed the light for Boardman Street.) BAX 01

Therefore, if the Casino were to be built and Winthrop residents have only one way to exit the town through East Boston when the Revere exit is closed because of flooding, it will be a traffic nightmare if nothing is done to alleviate this traffic problem at this intersection. Traffic backs up on Boardman Street even on a good day! Extensive traffic planning and studying need to be completed to alleviate this traffic congestion/back up at this intersection for the residents of Winthrop and East Boston. **I strongly suggest (urge) that the people making these decisions witness firsthand the traffic problems at the Route 1A/Boardman Street intersections during both AM and PM rush hours to better understand the problem before allowing this Casino to be built and commit to fix this traffic problem before this Casino is allowed to go forward.**

As I understand it, they plan to do a "flyover" on Route 1A for traffic flow into the Suffolk Downs casino, but this will not help the real traffic problem at the intersection of Route 1A and Boardman Street.

When MEPA writes the scope for the EIR for this project, I request that MEPA makes sure that the following are specifically in the EIR:

1. That the intersection of Route 1A and Boardman Street be included in all traffic analysis and that a Level of Service Analysis is done for the intersection in all of the alternatives analysis. BAX 02



2. That the analysis on this intersection be performed based on actual traffic counts. I believe a full week of counts, while schools are open, is needed. BAX 03

3. That the traffic study in the EIR identify ways to improve traffic flow through this intersection by considering things such as improvements to the signal, changing the signal timing, adding exclusive turn lanes, or any other traffic mitigation measures (as opposed to relying on a traffic control officer). BAX 04

4. If improvements to the signal timing or a new signal would make even small improvements, that the developer works with the City of Boston Transportation Department to implement these improvements right away so that the congestion is reduced as soon as possible even before the Casino is opened, understanding that additional traffic mitigation may be coming later when the project goes to construction. BAX 05

Thank you for your consideration of my comments and look forward to seeing some drastic measures taken to reduce the traffic congestion in this area.

Sincerely,

Lois A. Baxter

BAXTER, LOIS

BAX 01 **The real traffic problem for Winthrop and East Boston residents is the Route 1A/Boardman Street intersection where traffic can back up... Traffic backs up on Boardman Street even on a good day! Extensive traffic planning and studying need to be completed to alleviate this traffic congestion at this intersection... I strongly suggest that the people making these decisions witness firsthand the traffic problems at the Route 1A/Boardman Street intersections during both AM and PM rush hours to better understand the problem before allowing this casino to be built and commit to fix this traffic problem before this casino is allowed to go forward.**

The traffic analysis presented in Section 5.0 is founded on actual traffic data collection and observation of conditions in the field.

BAX 02 **I request that MEPA makes sure... that the intersection of Route 1A and Boardman Street be included in all traffic analyses and that a LOS Analysis is done for the intersection in all of the alternatives analyses.**

An LOS analysis of the Route 1A and Boardman Street intersection is included in all traffic analyses for all alternative concepts presented in Section 5.0.

BAX 03 **I request that MEPA makes sure... that the analysis on this intersection be performed based on actual traffic counts. I believe a full week of counts, while schools are open, is needed.**

The analysis in Section 5.0 is based on actual counts performed while schools were in session. These included full-week counts at key locations as described in Section 5.2.7.

BAX 04 **I request that MEPA makes sure... that the traffic study in the EIR identify ways to improve traffic flow through this intersection by considering things such as improvements to the signal, changing the signal timing, adding exclusive turn lanes, or any other traffic mitigation measures (as opposed to relying on a traffic control officer).**

The Proponent has advocated for a flyover solution at this location. As requested by MassDOT, an alternatives analysis of other options is presented in Section 5.5.

BAX 05 I request that MEPA makes sure… if improvements to the signal timing or a new signal would make even small improvements, that the developer works with the City of Boston Transportation Department to implement these improvements right away so that the congestion is reduced as soon as possible even before the casino is opened, understanding that additional traffic mitigation may be coming later when the Project goes to construction.

The Proponent will work with BTD and MassDOT to strive for early implementation of traffic improvements where possible.

Re: Suffolk Downs Casino
MEPA 15006

Bike to the Sea, Inc hereby submits the following comments on the Scope of Work for the Draft ENF for the Suffolk Downs Casino.

Our organization has been working for 20 years to promote bicycling and bicycling safety along the Northern Strand communities including Revere, Saugus, Everett, Lynn and Malden. Heavy congestion and the lack of bicycle accommodations create significant obstacles to safe bicycling in our area. A major contributor is the traffic along Routes 1, 1A, 60 and 16 especially on beach days. Pedestrians face similar barriers.

Given that this is a regional facility, the EIR should consider regional impacts. Pedestrian and bicycling crossings at major rotaries and intersections are particular problems. Bicyclists are banned (probably illegally) from Copeland Circle where Route 60 and Route 1 intersect. Brown Circle – where Route 60 and Route 107 come together has no safe pedestrian crossings. Bell Circle is one of the most dangerous and confusing places to walk, drive and bicycle. **BS 01**

Casinos generate large volumes of traffic particularly on weekends. The draft EIR should be sure to take into account traffic volumes on summer "beach" weekends when traffic is heaviest. **BS 02**

Consideration should be given to ensuring regional bicycle trail and route connections to the area including creating a connection from the Northern Strand in North Revere along Route 1 towards Squire Road and Charger Street. Pedestrian and bicycle connections from Park Street **BS 03** **BS 04**

/Winthrop Street along the Belle Isle Inlet and Bennington Street / East Boston Greenway in East Boston should be reviewed as an alternative to the walkway shown from Route 1A.

Sincerely yours,

Stephen P. Winslow
Secretary

BIKE TO THE SEA, INC.

BS 01 **Given that this is a regional facility, the EIR should consider regional impacts. Pedestrian and bicycling crossings at major rotaries and intersections are particular problems. Bicyclists are banned (probably illegally) from Copeland Circle where Route 60 and Route 1 intersect. Brown Circle – where Route 60 and Route 107 come together has no safe pedestrian crossings. Bell Circle is one of the most dangerous and confusing places to walk, drive and bicycle.**

The roadway improvements committed to by the Proponent in the HCAs with Revere and Boston include many pedestrian and bicycle safety improvements and physical accommodations on and off site (see Section 5.6).

BS 02 **The Draft EIR should be sure to take into account traffic volumes on summer "beach" weekends when traffic is heaviest.**

The DEIR/EPNF traffic analysis in Section 5.0 addresses peak Friday afternoon commuter peak hour and Saturday afternoon peak hour conditions.

BS 03 **Consideration should be given to ensuring regional bicycle trail and route connections to the area including creating a connection from the Northern Strand in North Revere along Route 1 towards Squire Road and Charger Street.**

The HCA commitments include on-street bicycle accommodations in the Bennington Street corridor connecting Constitution Beach, Belle Isle Marsh, and Revere Beach.

BS 04 **Pedestrian and bicycle connections from Park Street/Winthrop Street along Belle Isle Inlet and Bennington Street/East Boston Greenway in East Boston should be reviewed as an alternative to the walkway shown from Route 1A.**

Pedestrian and bicycle connections are described in Section 1.4.

Comments for MEPA Review of Caesar's Resort at Suffolk Downs
3/7/13

Daniel Blustein
Revere, MA

I hope that creative ideas fueled by new technologies are explored for this large-scale project. The proponents have released vague plans regarding the incorporation of renewable energy sources and natural stormwater retention systems (landscaping). These are key areas in which environmental considerations should drive forward thinking and not just the path of least resistance. A few questions that should be considered:

-*Can the project incorporate the use of pervious/permeable pavements to improve groundwater retention?* This may require filling in roadway areas to increase elevation above the ground water line which, when done effectively, could limit the potential for flood damage. **BLU 01**

-*Can Sales Creek be modified to return it to some of its environmental importance?* Currently Sales Creek mostly serves as a storm water drainage system for Suffolk Downs. Historically, this waterway connected Belle Isle Marsh with the Chelsea River. If reconnected and rehabilitated, Sales Creek could become an important ecosystem for anadromous fish, juvenile crustaceans, endangered shore birds, and many other resources. **BLU 02**

-*How are the proponents planning to mitigate the continued, and likely increased, pressure that horse waste has on local ecosystems?* While positive work has been completed in response to the proponent's Clean Water Act Settlement, there has been little talk about how the proposed development will increase the generation of animal waste and its subsequent handling. **BLU 03**

-*What are the most effective sources of renewable energy for the site?* Many different types of renewable energy sources have been mentioned by the proponent but it would be helpful to see an alternatives analysis to explore the benefit of renewables and to help identify the most effective options. **BLU 04**

BLUSTEIN, DANIEL

BLU 01 **Can the Project incorporate the use of pervious/permeable pavements to improve groundwater retention?**

The Project will utilize pervious pavement in pedestrian and plaza areas when appropriate (see Section 4.4).

BLU 02 **Can Sales Creek be modified to return it to some of its environmental importance? Currently Sales Creek mostly serves as a storm water drainage system for Suffolk Downs. Historically, this waterway connected Belle Isle Marsh with the Chelsea River. If reconnected and rehabilitated, Sales Creek could become an important ecosystem for anadromous fish, juvenile crustaceans, endangered shore birds, and many other resources.**

The proposed upgrades to the existing stormwater management system, coupled with a reduction of approximately 12 acres in impervious surfaces on the Project site, will significantly improve water quality discharging towards Sales Creek relative to existing conditions.

BLU 03 **How are the proponents planning to mitigate the continued, and likely increased, pressure that horse waste has on local ecosystems? ... There has been little talk about how the proposed development will increase the generation of animal waste and its subsequent handling.**

The generation of animal waste is not anticipated to increase as a result of the proposed Project. In addition, the Project will have no effect on the BMPs for handling horse waste, bedding, and feed that are dictated by the U.S. EPA and are currently practiced at the racetrack. Indeed, the surface area of the CAFO, where all such waste, bedding, and feed currently are contained, is expected to decrease when a portion of the existing barn area is converted to parking. That conversion will actually enhance the ability of the CAFO's new process-water control systems (which already handle more process water than EPA requires) to manage process water.

BLU 04 **What are the most effective sources of renewable energy for the site?**

Renewable energy sources are evaluated in Sections 7.2 and 7.4.

Re: EEA No. 15006 (Caesars Resort at Suffolk Downs)

Dear Secretary Sullivan:

On behalf of Boston Harbor Island Alliance (BHIA), I write to provide comments on the pending Environmental Notification Form for the Caesars Resort at Suffolk Downs project. These comments are focused on the Public Benefits portion of the ENF (section 1.5).

BHIA is a nonprofit organization whose sole purpose is to promote the public use and awareness of the Boston Harbor Islands National Park Area, created by Congress in 1996. As you know, we work closely with your agencies, particularly the Department of Conservation and Recreation, along with the National Park Service and the City of Boston to promote access and use of the Harbor Islands.

BHIA supports this project. We are impressed with the Proponent's efforts to make it a "green" project, and particularly with their commitment to LEED certification. We are also pleased with the effort the Proponents have put into public outreach and their willingness to engage with all parties.

BHIA generally agrees with the description of Public Benefits set out in the ENF. We believe, however, that the ENF defines the parameters of the project and its potential benefits too narrowly, and would urge that Boston Harbor and the Boston Harbor Islands be included in the analysis during the MEPA process. **BHIA 01**

The Proponent has clearly spent considerable time and effort in designing a complex project which will "promote connectivity to adjacent land uses" (section 1.5, page 1-5, Open Spaces) and "link neighborhoods and ecosystems" (section 2.2.4, page 2-8). In addition, the Proponent, as required by a consent decree with the US EPA, will "improve public access…and protect natural resources" of the Belle Isle Marsh (section 1.5, page 1-6). And, as noted in the ENF (also page 1-6), the Proponent is "contemplating a potential connection to water shuttle service."

The Proponent demonstrates significant analysis of Boston Inner Harbor water transportation opportunities which could bring guests to the resort (section 2.2.5.2, pages 2-11 and 2-12). However, water transportation is not discussed as part of section 3.6 Alternative Modes of Transportation (pages 3-19 to 3-21).

Based on the Proponent's clear objectives of providing a direct and easy connection to local natural resources, to improve access to those resources and the exploration of connecting the project to future water transportation routes, BHIA strongly urges that the Proponent be directed to expand the scope to include access to the Boston Harbor Islands National Park Area, a natural resource within sight and a short boat ride from the project location. By connecting the resort development to the Boston Harbor Islands, the Proponent will not only provide an alternative mode of transportation and a better visitors experience for guests and patrons of the resort, but it will also fulfill some key objectives that the Legislature laid out in Chapter 194 of the Acts of 2011 - the Gaming statute. The gaming statute calls on proponents to provide measurable economic benefit to not only the impacted communities but to the region and state as a whole. The Harbor Islands are truly a regional and statewide treasure that is used and valued by residents of Boston, Winthrop, Revere and all of the state's cities and towns. **BHIA 02**

The statute also implores proponents to mitigate impacts on existing cultural institutions and work with them and other entertainment venues via cross marketing and coordination to ensure "…patrons experience the diversified regional tourism industry."

The Boston Harbor Islands are a cornerstone of the local tourism experience.

We stand ready, willing and able to work with Caesars and Suffolk Downs to ensure a partnership is created that bolsters the experience of visitors to their resort casino and strengthens the broader tourism experience for both visitors and citizens alike in the communities surrounding Boston and Boston Harbor. BHIA would like the Proponent to explore supporting the Park and water transportation in the following ways: **BHIA 03**

- Provide information to the public in general and to resort guests on the opportunities presented by the Park.
- Underwrite public water transportation to the Park and within Boston Harbor.
- Include an analysis of direct water transportation opportunities from the resort to the Park and within Boston Harbor and the surrounding water transportation nodes in the region.

The Boston Harbor National Park Area is a tremendous resource for residents and visitors. It seems fitting that the Proponent would include information about and access to the Park and the Harbor in its overall planning. Doing so will enhance the Caesars guest experience, while supporting a potent economic driver for local tourism, more than 130,000 visitors took public ferries to the Park in 2012, with overall visitorship estimated at 500,000 last year.

Thank you for the opportunity to comment. We very much look forward to hearing more about the project and are available to provide additional information as the MEPA process continues.

Very truly yours,

Tom Powers

Tom Powers
President

BOSTON HARBOR ISLAND ALLIANCE

BHIA 01 **BHIA generally agrees with the description of Public Benefits set out in the ENF. We believe, however, that the ENF defines the parameters of the Project and its potential benefits too narrowly, and would urge that Boston Harbor and the Boston Harbor Islands be included in the analysis during the MEPA process.**

The Proponent is committed to working with the City of Boston on improving water transportation in the City and is providing funding for a South Boston to East Boston ferry service to increase the use of water transportation within the City generally.

BHIA 02 **Based on the Proponent's clear objectives of providing a direct and easy connection to local natural resources, to improve access to those resources and the exploration of connecting the Project to future water transportation routes, BHIA strongly urges that the Proponent be directed to expand the scope to include access to the Boston Harbor Islands National Park Area, a natural resource within sight and a short boat ride from the Project location.**

The Proponent supports Mayor Menino's vision to enhance water transportation options to East Boston by instituting regular water shuttle service between the South Boston and East Boston waterfronts. As such, the Boston HCA includes funding that will assist the City in establishing this service.

BHIA 03 **BHIA would like the Proponent to explore supporting the Park and water transportation in the following ways:**

- **Provide information to the public in general and to resort guests on the opportunities presented by the Park;**
- **Underwrite public water transportation to the Park and within Boston Harbor; and**
- **Include an analysis of direct water transportation opportunities from the resort to the Park and within Boston Harbor and the surrounding water transportation nodes in the region.**

The Proponent intends to post a Boston Gateway display focusing on various area attractions in the public atrium between Casino Areas I and II. The Proponent also intends to underwrite shuttle service to existing water transportation, and the Boston HCA includes funding that will assist the City in establishing water transportation services between the South Boston and East Boston waterfronts. Direct water transportation to the site is not feasible.

To: Buckley, Deirdre (EEA)
Subject: EEA #15006: Environmental Concerns About East Boston Casino Proposal

Hi Deirdre,

I'm writing to you to express my concerns about the environmental impacts of the proposed casino by Caesar's in Suffolk Downs. As you are aware, East Boston is in close proximity to the airport and at least two major highways which have already elevated the pollution levels way above normal for an urban area. I have been living in East Boston for about six years and would like to make this a long term home. I fear that if the casino is built and the anticipated additional traffic of 10,000 vehicles on a weekday and up to 40,000 vehicles on Sat. and Sunday come to fruition, this will only add to the pollution concerns in the area. I'm especially disappointed at the developer's attempt to "white wash" this issue by stating that the casino being built will be the "greenest casino" ever. The reality is that building a 500,000 square foot structure on marsh land is NOT green and adding vehicle congestion to the area is NOT green, their attempt to mitigate this by claiming that the building will be LEED Certified is a poor effort to mask the real issue of the additional pollution and congestion that they will be creating. Please take this e-mail, along with the e-mails of my neighbors, in to consideration when reviewing the proposal of the Suffolk Downs Casino. Thank you. **BUR 01**

Sincerely,

Jason Burrell
(617) 501-7687

BURRELL, JASON

BUR 01 **I fear that if the casino is built and the anticipated additional traffic of 10,000 vehicles on a weekday and up to 40,000 vehicles on Saturday and Sunday come to fruition, this will only add to the pollution concerns in the area.**

A microscale analysis has been performed for the Project area, and the methodology and results are provided in Sections 6.5.4.2 and 6.5.5.2, respectively.

CLEAN WATER ACTION
MASSACHUSETTS

March 26, 2013

Secretary Richard K. Sullivan, Jr.
Executive Office of Energy and Environmental Affairs
Attn: MEPA Office
Deirdre Buckley, **EEA no. 15006**
100 Cambridge Street, Suite 900
Boston, MA 02114

Subject: Public Comments for EEA no. 15006, Caesars Resort at Suffolk Downs

Dear Secretary Sullivan,

We are grateful for the opportunity to provide comments on the project proposed for the Suffolk Downs site. Clean Water Action is a 30,000+ member organization of diverse people and groups In Massachusetts joined together to protect our environment, health, economic well-being and community quality of life. Our goals include clean, safe and affordable water; prevention of health threatening pollution; creation of environmentally safe jobs and businesses; and empowerment of people to make democracy work. Clean Water Action organizes strong grassroots groups and coalitions and campaigns to elect environmental candidates and solve environmental and community problems.

We are pleased to understand that the design for Caesars Resort at Suffolk Downs proposes to reduce impervious surface cover by nine acres due to the reduced capacity of polluted stormwater runoff from the reduced acreage of impermeable surfaces.

CWA is pleased that the project proposes to use many energy-efficiency measures onsite such as heat recovery, high-efficiency lighting with energy-saving lighting controls, and water-conserving plumbing fixtures to reduce energy consumption, meet criteria of Massachusetts' Stretch Code and also LEED certification. Nonetheless, natural gas needs for the proposed facility will be provided by "new or existing service," according to the proposal. CWA has concerns about installation and use of a new underground pipeline inasmuch as any threats for leakage and explosion to the nearby areas of industrial, business, or residential uses. **CWA 01**

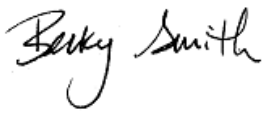
1010 Vermont Avenue NW, Suite 400 | Washington, DC 20005
Phone: 202.895.0420 | Fax: 202.895.0438
262 Washington Street #601 | Boston, MA 02108
Phone: 617.338.8131 | Fax: 617.338.6449
www.cleanwateraction.org/ma

For the work that is described as minor regarding in the 25-foot Riverfront Area of Sales Creek, CWA would like to request use of Best Available Technology during and after construction to prevent any further erosion, runoff, or other damage to the creek and downstream water and streambed. We request that the same care and use of BAC be undertaken on the portion of the property associated with the 100-foot buffer zone to Coastal Bank and Salt Marsh, as well as the 25-foot Riverfront Area (in Boston) and 200-foot Riverfront Area (in Revere) is associated with the Chelsea River which is associated with, though perhaps not directly within, the proposal site. **CWA 02**

As for new demand for water and wastewater treatment services, CWA asks the project developer to consider whether a system which treats wastewater onsite for reuse in toilet flushing and some landscaping, as exists at Gillette Stadium, might be considered. Measures such as these both reduce water use and costs and pressure on existing infrastructure, but demonstrate sustainable and innovative water practices for which MA strives to be known. **CWA 03**

Certainly we are pleased to read that new stormwater control measures will greatly improve stormwater discharged from the site that will lead to enhanced water quality reaching Sales Creek, the Belle Isle Inlet, and Rumney Marshes ACEC. For stormwater and erosion control measures, both during construction and afterwards during operation of the proposed facility, CWA requests consideration for maximum use of vegetation (versus pavement and other permanent structures) and Low Impact Development (LID) strategies, as have been mentioned elsewhere in the proposal. This is for a number of reasons, including the ability of native vegetation to perform natural services such as stormwater capture and treatment, atmospheric cooling and relief, especially, of urban heat-island effects of large developments, and also add naturally beautifying elements to a project located in and near our urban neighborhoods and business districts. **CWA 04**

CWA requests that sampling access and results before, during, and after construction be made available to the public or interested parties representing the public, such as our organization for educational purposes. If the proposed improvements to stormwater quality are proven out, the project could serve as a model and an educational tool for local community education programs, as well as a model for other developments across the Commonwealth as stormwater regulations become more and more rigorous and municipalities will be charged with meeting new federal standards. **CWA 05**



During construction, CWA will ask for diesel vehicle idling maximum time limits to be specified and enforced. In keeping with Caesars Palace's environmentally progressive facility design nationwide, we request that they consider hiring construction and demolition companies that have retrofitted their diesel on-road and non-road equipment with Diesel Particulate Filters (DPF's) which filter and avoid discharging much of the soot and particulate matter which **CWA 06**

contribute to respiratory, heart, and lung dysfunction, and which also contribute to climate change due to the dark particulate matter in the soot from the diesel vehicles.

Increased water needs are calculated to be from current use of 40,200 gallons per day to 435,810 gallons per day and do not require any new permitting, ostensibly being supplied by reservoirs under operation of the Massachusetts Water Resources Authority. Proposed wastewater treatment capacity increases from 166,020 gallons per day to 473,100, and does require new permitting. Again, CWA has concerns that while the MWRA is currently operating with bountiful water supplies, this may not remain the case during the lifetime of this built project, especially with increased extreme weather events caused by a changing climate. For this reason, and for reasons of decreasing pressure on both existing water and wastewater infrastructure, we ask that the developers consider an alternative such as the onsite wastewater treatment and reuse scheme similar to the one at Gillette Stadium. **CWA 07**

Thank you, again, for this opportunity to comment on the proposed development by Caesars Resort at Suffolk Downs.

Sincerely,

Becky Smith
Campaigns Director
Clean Water Action

CLEAN WATER ACTION

CWA 01 **Natural gas needs for the proposed facility will be provided by "new or existing service," according to the proposal. CWA has concerns about installation and use of a new underground pipeline inasmuch as any threats for leakage and explosion to the nearby areas of industrial, business, or residential units.**

Based on a meeting with the gas utility, it is expected that the natural gas needs for the Resort will be provided largely through existing piping infrastructure. Should any new piping be required, such work will receive the necessary approvals and will be performed in accordance with applicable requirements governing installation, service, and maintenance.

CWA 02 **For the work that is described as minor in the 25-foot Riverfront Area of Sales Creek, CWA would like to request use of Best Available Technology (BAT) during and after construction to prevent any further erosion, runoff, or other damage to the creek and downstream water and streambed. We request that the same care and use of BAT be undertaken on the portion of the property associated with the 100-foot buffer zone to Coastal Bank and Salt Marsh, as well as the 25-foot Riverfront Area (in Boston) and 200-foot Riverfront Area (in Revere) which is associated with the Chelsea River, though perhaps not directly within the proposal site.**

The minor on-site activities proposed in the Sales Creek RFA are limited to proposed stormwater management system improvements and upgrades and construction of a small floodplain compensatory storage area adjacent to Sales Creek. Proposed upgrades to the stormwater management system, including any new or modified discharges, will be set back from Sales Creek and will comply with MassDEP stormwater standards. No work is anticipated to occur on or below the Inland Bank of Sales Creek or its adjoining BVW. Erosion and sedimentation controls, as well as a clearly delineated limit of work setback, will protect these resource areas during construction. The proposed upgrades to the stormwater management system should substantially improve the quality of discharged water relative to existing conditions. As demonstrated in Section 6.9, these activities have been designed to fully comply with WPA performance standards.

CWA 03 **CWS asks the project developer to consider whether a system which treats wastewater onsite for reuse in toilet flushing and some landscaping, as exists at Gillette Stadium, might be considered.**

The Project does not include a system to reuse wastewater onsite. Rainwater will be collected from building roofs and reused for landscape irrigation, track watering, and cooling tower water demand (see Section 9.3).

CWA 04 For stormwater and erosion control measures, both during construction and afterwards during operation of the proposed facility, CWA requests consideration for maximum use of vegetation (versus pavement and other permanent structures) and Low Impact Development (LID) strategies... This is for a number of reasons, including the ability of native vegetation to perform natural services such as stormwater capture and treatment, atmospheric cooling and relief, especially of urban heat island effects of large developments, and also add naturally beautifying elements to a project located in and near our urban neighborhoods and business districts.

Sections 4.4 and 4.5 describe LID strategies to treat stormwater, reduce the urban heat island effect, and provide visual interest on the site.

CWA 05 CWA requests that sampling access and results before, during, and after construction be made available to the public or interested parties representing the public, such as our organization, for educational purposes. If the proposed improvements to stormwater quality are proven out, the Project could serve as a model and an educational tool for local community education programs, as well as a model for other developments across the Commonwealth as stormwater regulations become more and more rigorous and municipalities will be charged with meeting new federal standards.

The proposed stormwater management system will greatly improve existing conditions, and the Project will comply with all applicable stormwater regulations.

CWA 06 During construction, CWA will ask for diesel vehicle idling maximum time limits to be specified and enforced. In keeping with Caesars Palace's environmentally progressive facility design nationwide, we request that they consider hiring construction and demolition companies that have retrofitted their diesel on-road and non-road equipment with DPFs which filter and avoid discharging much of the soot and particulate matter which contribute to respiratory, heart, and lung dysfunction, and which also contribute to climate change due to the dark particulate matter in the soot from the diesel vehicles.

Construction-period air quality, including diesel emissions and vehicle idling, is discussed in the Draft CMP in Attachment L.

CWA 07 **CWA has concerns that while the MWRA is currently operating with bountiful water supplies, this may not remain the case during the lifetime of this built Project, especially with increased extreme weather events caused by a changing climate. For this reason, and for reasons of decreasing pressure on both existing water and wastewater infrastructure, we ask that the developers consider an alternative such as the onsite wastewater treatment and reuse scheme similar to the one at Gillette Stadium.**

The Project does not include a system to reuse wastewater onsite. Rainwater will be collected from building roofs and reused for landscape irrigation, track watering, and cooling tower water demand (see Section 9.3).

RE: Caesars Resort at Suffolk Downs (the "Project")
EEA No. 15006

Dear Secretary Sullivan:

MC-EB Realty LLC is the owner of 415 William McClellan Highway which is the site of a planned mixed-use development involving hotel, restaurant and retail development which has recently completed MEPA review. We are submitting this letter to provide comments on the above-referenced ENF within the comment period which ends March 26, 2013. We have reviewed the above-referenced ENF and note that it described certain roadway improvements which will be required to enable the Project to proceed, certain of which will be located in part on our property. **FBC 01**

We are supportive of the Suffolk Downs redevelopment, and have designed our development in a manner to assist with the implementation of the traffic and transportation improvements which are shown in conceptual fashion in the above-referenced ENF. We remain concerned however, that despite preliminary discussions with the Proponent to clarify the terms of the planned acquisition of that portion of MC-EB Realty's property needed to undertake these improvements, there is as yet no, even conceptual agreement, as to the extent, terms, size or timing of any such acquisition. We respectfully request that the Proponent clarify the extent, timing and terms of any planned acquisition so that we may analyze whether this is even feasible, considering the needs of our development with the proposed development of our property.

I respectfully request that the Proponent provide copies of all future MEPA filings to my office. We appreciate the opportunity to comment.

Very truly yours,

James Karam

FBC 01 **... Certain roadway improvements which will be required to enable the Project to proceed... will be located in part on our property... We remain concerned that despite preliminary discussions with the Proponent to clarify the terms of the planned acquisition of that portion of MC-EB Realty's property needed to undertake these improvements, there is as yet no, even conceptual, agreement as to the extent, terms, size, or timing of any such acquisition.**

As noted in the analysis of transportation alternatives included in Section 5.0, there are some alternatives for the Route 1A improvements that require varying degrees of additional right-of-way beyond the current roadway limits. The Proponent expects that, at the completion of the permitting process, the roadway improvements will not require the use of any portions of MC-EB Realty's property other than those portions that the property owner has reserved for roadway improvements in connection with its Project Notification Form filed with the BRA on September 17, 2012. The Proponent will continue to work with the First Bristol Corporation on this issue as it proceeds with its development this Fall.

To whom it may concern:

I am an East Boston resident of just over a year. My wife and I are currently looking to buy a place in the Jeffries Point neighborhood. We have an offer in at the time and are excited about the prospect of our new condo on Chelsea st. The neighborhood has grown on us and we like the direction it is going in all ways but one.

The idea that a casino may go up at Suffolk Downs is very disconcerting. I did not understand, at first, the long-term effect that a casino has on a neighborhood. I started to hear grumblings amongst fellow eastie residents and did some of my own research. The change in home prices, crime and traffic are just a few of the seemingly inevitable negative effects a Casino will have. As I become more and more a part of this community I will become more and more vocal, like so many residents in East Boston. I think there is a surge of information getting out there informing residents of the negative long-term impact of a casino and I think we have the power to stop it. If not, we may end up regretting the decision to buy in Eastie. **FOR 01**

Ryan Forsyth

FORSYTH, RYAN

FOR 01 **The change in home prices, crime, and traffic are just a few of the seemingly inevitable negative effects a casino will have.**

Traffic impacts associated with the Project and corresponding proposed mitigation measures are addressed in detail in Section 5.0. Please see the response to ANT 01 regarding potential impacts on home prices and crime.

RE: EEA No. 15006 - Caesars Resort at Suffolk Downs ENF Comments

Dear Secretary Sullivan:

Thank you for the opportunity to comment on the Caesars Resort at Suffolk Downs Environmental Notification Form (ENF). I am submitting these comments on behalf of the Friends of Belle Isle Marsh. The Friends of Belle Isle Marsh has a number of concerns about the impacts this project may have on its immediate surrounding area, including the Belle Isle Marsh, the broader Critical Areas of Environmental Concern, as well as on the adjacent neighborhoods and region.

The Friends of Belle Isle Marsh, as residents of East Boston and Revere, treasure our home. However, the area isn't without its challenges. Throughout our community a significant number of less attractive commercial and industrial developments have been constructed. Many in East Boston believe from past experience that residents and workers in the area have not been adequately represented in decision-making processes. We would like to believe that a development the size and complexity of Caesars Resort at Suffolk Downs could become an attractive addition to our community. But this depends on transparency, good planning, and accountability. We urge MEPA to ensure that this project, should it come to fruition, be a positive for the community and for our natural environment.

Friends of Belle Isle Marsh, a non-profit 501(c)(3) grassroots environmental organization, was formed in the early 1980s to help preserve the Belle Isle Marsh and to publicize its importance as an urban natural resource. We believe that protection ultimately depends on public awareness of the value and beauty of this natural resource.

Among the largest surviving salt marshes in Boston Harbor, Belle Isle Marsh showcases plants and wildlife now rare to the Metropolitan area. The 241-acre marsh is a critical habitat for wildlife and vegetation. With its walking paths and beautiful coastal views, the Belle Isle Marsh also serves as a delightful respite for visitors. Within the Reservation, DCR manages 28 acres of landscaped park, including a circuit trail, benches, and an observation tower. Belle Isle Marsh is a natural treasure and important resource to East Boston and its surrounding communities.

The main entrance to the Belle Isle Marsh Reservation is off of Bennington Street, across from the Suffolk Downs MBTA Subway Station. The existing Suffolk Downs racetrack sits West of the main entrance, behind the Suffolk Down Station. As the crow flies, it is less than a tenth of a mile between the Marsh's perimeter and the Suffolk Downs racetrack. As such, a development the size and complexity of the Caesars Resort at Suffolk Downs is of considerable concern to the Friends of Belle Isle Marsh.

There is a history of environmental contamination at this site. Recently, the EPA and the Department of Justice found that Suffolk Downs had violated Section 301 of the Clean Water Act by discharging pollutants including manure, urine and bedding materials into Belle Isle Creek. The Belle Isle Creek runs through the Suffolk Downs racetrack and horse barn property and feeds the Marsh. In addition to paying a civil penalty of $1.25 million, Suffolk Downs will implement three Supplemental Environmental Projects (SEPs), at a total cost of approximately $742,000. Two of the SEPs are designed to monitor the water quality of the Mystic River and the Saugus River watersheds. The third SEP requires the installation of a boardwalk at Belle Isle Marsh. The boardwalk is designed to provide community access to the marsh without causing harm to sensitive wetland vegetation or destabilizing the marsh's riparian buffer.

The Friends of Belle Isle Marsh is exceedingly concerned with the impacts the Project may have on Belle Isle Creek and Marsh and the broader local floodplain and wetlands, especially given the recent Clean Water Act violation. We want assurance that these areas of Critical Environmental Concern are protected during both construction of the Resort, as well as during its ongoing operations. We understand that the Mystic River Watershed Association (MyRWA) is submitting comments to your office addressing potential water-related impacts on the watershed. Friends of Belle Isle Marsh fully supports MyRWA's ENF comments. **FBIM 01**

The following comments reflect principally our concerns about the transportation aspects of the Project and its associated environmental impacts, including air, noise and visual pollution on the Belle Isle Marsh and its surrounding area.

Comments on Transportation Matters

We have broken the following comments into several sections:

- Vehicular traffic, Transportation Demand Management, and Parking

- Public Transportation
- Pedestrian Access
- Bicycle Access
- Urban Design, Open Space, and Landscaping
- Overall Community Benefits

Vehicular Traffic, TDM, and Parking

We agree with the Proponents that the most significant environmental impact from this project is the generation of new traffic and its resultant air quality impacts (p. 7). Traffic congestion has been a chronic problem in Revere and East Boston. This congestion is bad for the community and bad for our environment. We also think that if not fully addressed, it will be bad for the proposed project itself.

The Proponent estimates that there will be an additional 24,600 vehicle trips per day generated from this project, in addition to the 15,900 trips already experienced at the site. This more than doubles site-related vehicle trips per day.

From the current traffic counts included in the ENF, and from empirical evidence, there is no argument that the roads in the Route 1 corridor are congested. We fear that additional trips from this project will amount to a tipping point, taking us from a bad situation to an unbearable one. The resultant air pollution from these additional vehicles sitting on clogged roads is of great concern to the Friends of Belle Isle Marsh. Given the density of the Orient Heights and other residential neighborhoods in the area, impacts on public health from air pollution, including asthma, allergies, respiratory illness are of real concern and need to be taken into account in any transportation analysis.

The Proponents have listed a number of areas within the Route 1A corridor that need improvement:

- Improvements at Route 1/Route 16 interchange
- Northbound flyover at Boardman Street
- Additional southbound lane on Route 1A
- Signalization at Waldemar Avenue
- Signalization at Tomasello Drive

We agree that these areas are in desperate need of attention. However, we believe that the Proponent is taking a piecemeal approach to roadway improvements. ***We urge MEPA to require the Proponents to conduct a Comprehensive Corridor Study of the Route 1A area, from the Sumner, Callahan and Ted Williams tunnels to Copeland Circle.*** **This corridor study should be done in conjunction with all applicable planning, design and regulatory bodies at the local, regional, and state levels.** **FBIM 02**

There have been a number of transportation analyses done of this area in the past. However, due to the size of this project and the forecasted increase in vehicular trips, an **FBIM 03**

up-to-date, holistic review of the corridor is necessary. We are not proposing this in order to delay the MEPA process. We are proposing this because there are significant, complex traffic problems all along the corridor. Residents and visitors alike are already faced with terribly challenging traffic conditions daily; the addition of 26,400 trips daily will make this situation worse.

In addition, there are number of other development proposals happening simultaneously to this project and more that are likely to occur because of the proposed project. Perhaps the most significant currently is the project proposal at 415 McClellan Highway at the corner of Route 1A and Boardman Street. This project's proposal calls for the construction of a new hotel containing 117,060 SF and 400 parking spaces. In addition, we understand that Global Petroleum intends to increase the volume of ethanol at its facility on Route 1A and increase the number of trucks entering and exiting the facility. Currently, a number of trucks serviced by this facility turn around at the "jug handle" near the entrance to Suffolk Downs. Truck traffic crossing from southbound to northbound using the "jug handle" requires a traffic signal, stopping the flow of traffic in both north and south directions. Additional truck traffic along the corridor will create additional north-south vehicular traffic delays at that traffic light and impede the flow of traffic into and out of Tomasello Drive, the main entrance to the Resort.

We ask the Proponent be required to include the 415 McClellan project, the truck traffic generated from Global Petroleum's current and future operations, as well as any other projects that may reasonably effect the corridor, in its DEIR transportation analysis. **FBIM 04**

In addition, *we ask that the Proponent be required to prove that additional vehicular traffic will not affect emergency services to the surrounding residential neighborhoods and local commercial, retail, and maritime areas. This analysis should include a scenario in which there is a serious accident at the Global Petroleum terminal.* **FBIM 05**

<u>Improvements at Route 1/Route 16 interchange:</u>

The Proponents have offered a preliminary concept plan for potential mid-term improvements at this interchange and state that the DEIR will include a study of such improvements using CTPS Modeling. They further state that any design of the improvements will be developed in coordination with MassDOT, DCR, and the cities of Revere and Chelsea.

This is a good start. However, we urge a more in-depth analysis of this area and of the relationship effects of any other design changes along other parts of the corridor. We are concerned particularly with how any changes to this area will affect Bell Circle (Route 1A and Route 60). **FBIM 06**

The difficulty faced by Route 1 Southbound travelers accessing Route 16 eastbound must be remedied. For decades, Route 60 has been the route used by southbound traffic accessing Logan Airport. To lessen the traffic load on Route 60, including traffic generated **FBIM 07**

by Logan Airport, the solution to the Route 1/Route 16 interchange has to be seen by the general populace as a significant improvement over current conditions or these travel patterns, ingrained over decades, will not change.

The Lower North Shore Transportation Improvement Study by CTPS in 2000 provides further insight into the difficulties at the Route 1/Route 16 interchange:

> "The present interchange lacks connections between Route 16 to the east and Route 1 to the north. All traffic to and from Route 1 north and destinations such as Revere Beach and Logan Airport must use Copeland Circle and Squire Road (Route 60). New connections at Route 1/Route 16 provide the first of two necessary connections between Route 1 and Route 1A to give motorists an alternative to using Route 60."
>
> "Once Route 1 and Route 16 are connected, Route 1A and Route 16 must also have seamless connections to complete the full Routes 1/16/1A connection. Recent developments along the Route 1A corridor between Mahoney Circle and Boardman Street, including proposals for two new hotels, a waste transfer facility, and the redevelopment of Suffolk Downs, *indicate the need for a more comprehensive plan for the corridor. It was expected that this study could be a step toward for a coordinated, region wide effort."* (Lower North Shore Transportation Improvement Study, 2000, emphasis added. Please note, Mahoney Circle is commonly referred to as Bell Circle.)

To our knowledge, a region wide, comprehensive plan for the corridor has not been completed. The Suffolk Downs development only heightens the need to perform this study. **FBIM 08**

Northbound flyover at Boardman Street & Additional southbound lane on Route 1A

Similar to what they have offered at the Route 1/Route 16 intersection, the Proponent has provided a concept design to ostensibly ameliorate traffic congestion at Boardman Street and Route 1A. *Although this plan may well be of some benefit if implemented, it is imperative that any plans for the Boardman Street intersection be looked at within the broader context of the Route 1A Corridor.* **FBIM 09**

Signalization at Waldemar Avenue& Tomasello Drive

As with the other potential Roadway Improvements listed in the ENF, we would like any long-term design changes at these intersections be implemented after a Comprehensive Corridor Study is completed. **FBIM 10**

Additional Concerns with Site Related Vehicular Traffic

Service Vehicles

The Proponent has stated that they will address service and other commercial traffic in the DEIR. *We ask that MEPA require the Proponent to show that service and commercial traffic will not have an auditory or visual impact on the Belle Isle Marsh, Belle Isle Creek or Sayles Creek.* **FBIM 11**

In addition, to ensure that service and other commercial vehicles employed by the Resort do not contribute to undue air pollution, *we propose that the Proponent include an analysis of operating only 'green' vehicles such as hybrid, electric, and compressed natural gas in its business operations*. **FBIM 12**

In addition, we ask that the *Proponent investigate requiring outside suppliers and transportation providers of the Resort to utilize green vehicles and report its findings in the DEIR.* At the very least, suppliers and transportation providers, including Taxi companies, should be required to retrofit their vehicles with state of the art pollution control equipment such as emission control equipment, idle reduction technologies and engine upgrades or replacements. Because this could be seen as a financial burden to some local suppliers, the Proponent should subsidize these efforts, making them affordable to local suppliers. This would not only mitigate air pollution from commercial vehicles servicing the Resort, but could also be a community relations benefit. **FBIM 13**

<u>Parking</u>

Although the number of parking spaces is being reduced in the latest plan set forth in the ENF, this decrease in total available parking is less significant to Air Quality than the Proponent implies. *We ask that MEPA require that further Air Quality Analysis should be based on the number of parking space currently being utilized at the existing Suffolk Downs site, not on the number of parking spaces currently available.* Average peak occupancy of current available parking spaces is far less than the number of parking spaces at the existing Suffolk Downs site. **FBIM 14**

<u>Crash Analysis</u>

We ask that MEPA also require that the DEIR crash analysis incorporate the impact of casino traffic on public safety, and commit to mitigate any issues that may arise from this analysis. We are concerned that due to the nature of the casino business, including late night activities and alcohol consumption, patrons leaving the Caesars Resort at Suffolk Down may contribute to safety problems in our community. Reports have shown that accident rates and drunk driving rates have increased in communities near casinos, resulting not only in additional crashes, but also the need for additional enforcement and emergency services. One solution to this issue is to encourage patrons to utilize public transportation. **FBIM 15**

Public Transportation

The Proponent states that the Project will enhance access to and from the MBTA Blue Line Suffolk Downs-Belle Isle Station, and will upgrade pedestrian and shuttle connections to the project site. The Proponent expects a significant number of visitors and a substantial

proportion of project employees will access the site via public transportation (2.2). This is encouraging to us. But it doesn't go far enough.

Coordinating with MBTA on Subway and Bus Service

We ask that the Proponent work with the MBTA to assess additional capacity needs on the Blue Line and the bus lines servicing the project site and include their findings in the DEIR. This evaluation should include late night service and the addition of express buses to and from the resort as needed. We encourage the Proponent to contribute financially to this increase in service if necessary. Due to the nature of the Casino's business, patrons will be arriving and leaving the resort during hours that the MBTA service is typically scaled back. An increase in subway and bus service will likely be necessary in order for public transportation to be a viable option for patrons and employees alike. Further, there are specific events, such as the Revere Beach Sandsculpting Festival, that already stress Blue-line capacity. The potential development of a soccer stadium at Wonderland would greatly add to this stress on game days. *We ask that MEPA require the Proponent to report on scheduling additional express bus service to Downtown Boston and Wonderland Station during these peak demand special events in the DEIR.* **FBIM 16**

Access Via Subway and Bus

The Proponent states that the project will improve the pedestrian/shuttle link between Suffolk Downs MBTA Station and the Project entrances to encourage travel by public transit (2.2.2). Indeed, the Suffolk Downs MBTA Station is ideally located to the site. However, the pedestrian connection to and from the Suffolk Downs Station and the project site can be vastly improved.

A large amount of detail and expense is planned for the vehicular entrance at Tomasello Drive. There are already landscaping and hardscaping plans for this area: "creating a unique arrival sequence and visitor experience" and "embracing the site's natural ecology and providing a dramatic arrival…." Understandably, the Proponent wants a certain grand 'feel' to the entrance appropriate to the quality of a Caesars Resort. The plans for the connection between the Suffolk Downs MBTA Station and the Resort are considerably less developed, and without any mention of the grandeur planned for the Tomasello vehicular entrance.

To encourage use of public transportation, we believe that it is important to treat the connection between the Suffolk Downs MBTA station and the resort in a similar fashion to the Tomasello entrance. A shuttle service to and from the MBTA station is a bare minimum. *We request that the Proponents consider additional improvements to this connection. These should include a seamless, sheltered pedestrian connection from the station and the resort reflecting the attention to detail and feel of the Tomasello Drive entrance and include these plans in the DEIR.* **FBIM 17**

Employer -Sponsored Transit Demand Management

We request that MEPA require the Proponent to provide an analysis in the DEIR of employer-sponsored transit demand management strategies. **FBIM 18**

A common benefit offered by employers is the provision of transit passes. We request that the Proponent provide free MBTA Charlie Cards to all employees who use transit to get to work. This program could be fashioned to incentivize the use of transit, perhaps requiring employees to commute to and from work via public transportation the majority of days in order to receive the card.

Another consideration should be to provide onsite childcare to employees. Having onsite childcare better enables employees with young children to utilize public transportation or shared rides because it simplifies their route to work.

Another consideration should be for the Proponent to offer prioritized vanpool and car pool parking spaces to employees who must drive to work.

We believe measures such as these will work to encourage the use of public transportation, leading to fewer vehicle trips and better air quality for the community and broader region.

Other Shuttle Services

The Proponent states that they will explore the feasibility of shuttle services between the Project and Logan Airport, water transportation terminals, local and downtown hotels, downtown Boston, the Boston Convention and Exhibition Center, the Black Falcon Cruise Terminal, and major tourist attractions. *Where public transportation to and from these destinations is not feasible we encourage the inclusion of these shuttle services in the DEIR's TDM Analysis. We request that the Proponent include in this analysis the use of 'green' shuttle services as described in our comments in the above Service Vehicles section*. **FBIM 19**

Bike and Pedestrian Circulation and Access

The Proponent states "To enhance local and regional connectivity, the Project will improve bike and pedestrian circulation and access." Friends of Belle Isle Marsh believe physical access and connection to the Community is essential to the success of the Project. We encourage the Proponent ensure that the physical design of the Casino is outward facing and welcoming to pedestrians, cyclists and the community as a whole. **FBIM 20**

The Proponent has indicated the design "will promote connectivity to adjacent land uses" and includes on-street bicycle accommodations to connect Constitution Beach to Revere Beach along the Bennington Street corridor, along the connections to the project site behind the Suffolk Downs MBTA Station and from Winthrop Avenue. We support the inclusion of on-street bicycle facilities, but emphasize that it is essential that the Proponent encourage cycling in the safest possible manner. *We ask that MEPA require the Proponent to* **FBIM 21**

investigate and implement wherever possible best practices in cycling infrastructure, such as cycle tracks, bicycle signals, bicycle boxes and other leading- edge design elements, as detailed in the NACTO Urban Bikeway Design Guide in the DEIR. The Proponent should also include bicycle wayfinding signs in accordance with the Manual on Uniform Traffic Control Devices.

In addition, it is essential that the bike facility locations are sited so as to not only improve access to the project site, but also to provide meaningful network linkages to the larger bicycle network. *To this end, we request that MEPA require the Proponent to report on how it is coordinating with all stakeholders, including the Metropolitan Area Planning Council, who is already coordinating efforts to create networks for safe non-vehicular traffic in Revere, Chelsea, Everett, Malden, Saugus and Lynn*. **FBIM 22**

We ask that MEPA strongly encourage the Proponent to explore sponsorship opportunities to bring the Hubway Bike Share system to East Boston and Revere on and around the project site. Hubway Bike Share would provide accessibility to cycling for visitors and employees as well as local residents. Cycling is ideal for short distances, displacing short vehicular trips. The Hubway system would allow local employees to commute via bicycle, provide a means for local residents to enjoy the open spaces of the project area, allow visitors to the casino to explore the neighborhoods of East Boston and Revere, and generally help integrate the Casino site with the community. **FBIM 23**

We ask MEPA to require the Proponent to include in its DEIR Pedestrian Access analysis how the Proponent may fund and facilitate the build-out of the East Boston Greenway to the Belle Isle Marsh and beyond, to Revere Beach. Building out the greenway will improve access to the Marsh, make important connections in the neighborhood and continue to improve the quality of life in East Boston and Revere for residents and visitors alike. The greenway build-out also advances the Casino project's stated pedestrian and bicycle circulation goals. **FBIM 24**

Safe sidewalks and crossings will become even more important as traffic volumes increase. In the ENF, the Proponent indicated "Sidewalks are provided on the majority of the study area roadways, but the physical condition of sidewalks and ADA compliance is deficient in several locations, and appropriate pedestrian crossing accommodations are absent at many locations." *We ask MEPA to require the Proponent to include in its DEIR analysis the undertaking and funding of a near-term project to repair and upgrade these identified sidewalk deficiencies.* **FBIM 25**

In order to reinforce the stated goals to enhance pedestrian connections and circulation, *we ask MEPA to encourage the Proponent to develop a robust pedestrian wayfinding system for the project area and the surrounding community.* A well-designed pedestrian wayfinding system encourages pedestrians by allowing them to easily navigate from place to place and understand their surroundings. This will benefit the Casino by helping guide pedestrian visitors to Casino facilities, and will allow visitors to enjoy the larger community with greater ease. **FBIM 26**

Urban Design, Open Space & Landscaping

We applaud Caesar's commitment to green building and their public pledge to build the greenest Casino in the Country at Suffolk Downs. However, to truly lead the industry with the Suffolk Downs project, the Proponent must pursue LEED Platinum status rather than LEED Gold. *We request that MEPA strongly encourage the Proponent to build Caesars Suffolk Downs as a LEED Platinum project and report the feasibility of this endeavor in the DEIR.* **FBIM 27**

While we applaud the stated decrease in impervious surfaces in the Project, *we ask MEPA to ensure the Proponents explore the use of permeable paving wherever possible on the site to further improve storm water management, particularly in the parking areas and pedestrian spaces*. There are several tested options for impervious parking lot applications, including pervious concrete, porous asphalt, and porous pavers. Use of permeable paving will also allow the Proponent the opportunity to reclaim and reuse the existing site asphalt. **FBIM 28**

Under the Expanded Gaming Law, applicants for gaming licenses are encouraged to procure or produce 10 percent of their annual electricity consumption from renewable sources. *We ask that MEPA require the Proponent to include in the DEIR an analysis of generating on-site enough renewable energy to meet, at a minimum, this 10 percent suggestion. In addition, we would like the Proponent to provide an analysis of how it may cover 50% and 100% of its annual electricity consumption with onsite and procured renewable energy.* A strong commitment to renewable energy is essential in the face of tremendous trip generation and the resultant air pollution expected from the Project. **FBIM 29**

Additional Studies

In addition to the environmental impacts that are already slated for study, we request that MEPA require the Proponent undertake several additional studies related to the impact of the development on the physical environment, including a light pollution study and a signage study.

The Proponent includes solar glare under the Development Review Components, however, *we encourage MEPA to require a comprehensive light pollution study to evaluate and recommend mitigations measures for all impacts of lighting planned for the project*, both interior and exterior, addressing issues of light trespass, over-illumination, and sky-glow. The investigation should look at the light impact on area wildlife, the project area generally and specifically on the residential neighborhood of Orient Heights directly abutting the project area. Recommendations for mitigation should include issues of shielding, color temperature, building materials, and other relevant issues. **FBIM 30**

We also urge MEPA to require investigation of visual blight from signage in the project area and surrounding communities. The current visual clutter of signage- from billboards to accessory signs in digital and traditional formats- lacks a cohesive scheme to unify and beautify the area. The study should include an inventory and analysis of the existing signage in the project area and surrounding environs, looking at zoning regulation and compliance. The study recommendations should include both the signage plan for the **FBIM 31**

Project, as well as recommendations for an area-wide scheme to improve signage aesthetics for the overall benefit of both the casino and the community. This project is a perfect opportunity to address this ongoing issue instead of compounding the problem.

Construction Considerations

As close neighbors to the project site, the Friends of Belle Isle Marsh are concerned about the conditions and impacts during the construction period, particularly potential negative impacts on Belle Isle Marsh and Creek. *We ask that MEPA require the Proponent include in the DEIR, in great detail, how construction of the Caesars Resort at Suffolk Downs will not negatively impact in any way the Belle Isle Creek, the Belle Isle Marsh or any of the Critical Environmental Area in and around the site.* The Proponent included numerous construction considerations, and we encourage them to pursue even more stringent policies and procedures to avoid negative construction impacts. We encourage the use of liquidated damages with contractors and sub-contractors to ensure that all stated precautions and mitigations are properly implemented. **FBIM 32**

Community Development

To further mitigate the environmental impact of the Casino in an ongoing manner*, we encourage MEPA to requirement consideration of long-term funding for "green jobs" and "green job training" in the mitigation plan.* Funding youth employment in conservation, such as Youth Conservation Corp (YCC) sponsored by Boston Natural Areas Network (BNAN) and creating training programs in the East Boston and Revere Communities, will both demonstrate the Proponents commitment to sustainability and nurture environmental stewards within the Community. **FBIM 33**

Comments on Process

In the past, with just a few exceptions, our community has been bruised by a lack of strong mitigation measures to avoid the worst of the resulting impacts and the lack of enforcement of mitigation agreements. As a result, we are exceedingly concerned with the impacts of the proposed Caesars Resort at Suffolk Downs and with the sequencing of the development and its related future developments in our area. To ensure that any proposed development truly has a positive impact on the neighborhood and on the related park lands, w*e would like to ask MEPA for assurance that any mitigation agreements made with the Proponent will be required and perhaps even provided as a requirement of any related state permits.* **FBIM 34**

Massachusetts Expanded Gaming Law Chapter 194, *An Act Establishing Expanded Gaming in the Commonwealth,* Section 10(c) states:

> "In awarding a category 1 license, the commission shall determine at what stage of construction a licensee shall be approved to open for business; provided, however, *that a licensee shall not be approved to open for business until the commission has*

> *determined…that total infrastructure improvements onsite and around the vicinity of the gaming establishment, including projects to account for traffic mitigation as determined by the commission, shall be completed before the gaming establishment shall be approved for opening by the commission*." (emphasis added)

Although this provides us with some hope that the Proponent will be required to fulfill the commitments they make, the fact that Phase 2 of the Gaming Regulations have not been completed gives us little guarantee as to what the Gaming Commission will require of the Proponent in terms of mitigation. It is understood that this issue is out of MEPA's jurisdiction. However, we believe that the current openness of the process on the Gaming Commission's end makes it all the more important that MEPA does everything it can to ensure that the Proponent meets all requirements under State jurisdiction. In addition, we would like to express our desire that the cities of Boston and Revere withhold occupancy permits until all mitigation has been completed. We encourage Revere and Boston officials to make this a requirement in their Host Community Agreements.

In Conclusion

In recent years, there has been some significant progress in making East Boston a greener, healthier neighborhood, and Friends of Belle Isle Marsh is happy to have played a significant role in these changes. We still face significant challenges from development around Belle Isle Creek and Belle Isle Marsh, many of which we have mentioned here. It is important that the positive trend continue, especially in the face of significant developments like the Caesars Resort at Suffolk Downs proposal.

First and foremost, we request that the Proponents be required to include in the DEIR a Comprehensive Corridor Study performed in conjunction with all applicable planning, design, and regulatory bodies at the local, state, and regional levels. For the reasons described above, this is the best way to ensure that roadway improvements done along the Corridor improve traffic conditions and air quality at the Belle Isle Marsh and in our local communities.

Although we believe that a Comprehensive Corridor Study is vitally important, the additional comments included in this letter are also of the utmost concern to the Friend of Belle Isle Marsh.

We ask that MEPA take seriously our concern for the health and vitality of the Belle Isle Marsh, and our community, and incorporate our requests into the upcoming DIER process. We urge MEPA to ensure that this Project, should it come to fruition, be a positive for the community and for our natural environment

Sincerely,

Daniela Foley

President
Friends of Belle Isle Marsh

FRIENDS OF BELLE ISLE MARSH

FBIM 01 **The Friends of Belle Isle Marsh is exceedingly concerned with the impacts the Project may have on Belle Isle Creek and Marsh and the broader local floodplain and wetlands... We want assurance that these Areas of Critical Environmental Concern are protected during both construction of the Resort as well as during its ongoing operations.**

Stormwater discharges during construction will be managed under a SWPPP prepared in accordance with the U.S. EPA NPDES Stormwater CGP and MassDEP stormwater regulations. Implementation of the SWPPP will include sedimentation and erosion control measures and other BMPs. The Project should not result in any impacts to Belle Isle Creek or adjacent Salt Marsh areas located north and east of the Project site.

FBIM 02 **We believe that the Proponent is taking a piecemeal approach to roadway improvements. We urge MEPA to require the Proponents to conduct a Comprehensive Corridor Study of the Route 1A area from the Sumner, Callahan, and Ted Williams tunnels to Copeland Circle. This corridor study should be done in conjunction with all applicable planning, design, and regulatory bodies at the local, regional, and state levels.**

Options for Route 1A infrastructure improvements are presented in Section 5.5. The Proponent has committed to a comprehensive package of roadway improvements in the HCAs with Revere and Boston HCAs (see Section 5.6). The City of Boston HCA includes a commitment to perform a Route 1A planning study.

FBIM 03 **There have been a number of transportation analyses done of this area in the past. However, due to the size of this Project and the forecasted increase in vehicular trips, an up-to-date, holistic review of the corridor is necessary.**

The City of Boston HCA includes a commitment to perform a Route 1A planning study.

FBIM 04 **We ask that the Proponent be required to include the 415 McClellan project, the truck traffic generated from Global Petroleum's current and future operations, as well as any other projects that may reasonably effect the corridor, in its Draft EIR transportation analysis.**

The DEIR/EPNF analysis includes regional background growth as determined by MassDOT and all background projects required by the cities of Revere and Boston, including 415 McClellan Highway. Global Petroleum's operations are captured in existing traffic counts.

FBIM 05 **We ask that the Proponent be required to prove that additional vehicular traffic will not affect emergency services to the surrounding residential neighborhoods and local commercial, retail, and maritime areas. This analysis should include a scenario in which there is a serious accident at the Global Petroleum terminal.**

The traffic analyses presented in Sections 5.5 and 5.7 projects overall improved traffic operations under Build compared to No Build conditions as a result of the extensive roadway improvements committed to in the HCAs. The overall improvement would be expected to improve conditions for emergency access.

FBIM 06 **We urge a more in-depth analysis of [the Route 1/Route 16 interchange] and of the relationship effects of any other design changes along other parts of the corridor. We are concerned particularly with how any changes to this area will affect Bell Circle (Route 1A and Route 60).**

Proposed improvements at the Route1/Route 16 interchange, the Route 16/Route 145 intersection, and at Bell Circle are described in Section 5.6, and operational analysis is presented in Section 5.7.

FBIM 07 **The difficulty faced by Route 1A Southbound travelers accessing Route 16 eastbound must be remedied. For decades, Route 60 has been the route used by southbound traffic accessing Logan Airport. To lessen the traffic load on Route 60, including traffic generated by Logan Airport, the solution to the Route 1/Route 16 interchange has to be seen by the general populace as a significant improvement over current conditions or these travel patterns, ingrained over decades, will not change.**

The Proponent shares this position, and at the request of the City of Revere has committed to provide improved connections at Route 1/Route 16 in coordination with MassDOT, DCR, and the cities of Revere and Chelsea.

FBIM 08 **To our knowledge, a region wide, comprehensive plan for the corridor has not been completed. The Suffolk Downs development only heightens the need to perform this study.**

The Boston MPO's Lower North Shore Transportation Improvement Study was prepared by the CTPS Staff for the Massachusetts Highway Department in October 2000.

FBIM 09 **Similar to what they have offered at the Route 1/Route 16 intersection, the Proponent has provided a concept design to ostensibly ameliorate traffic congestion at Boardman Street and Route 1A. Although this plan may well be of some benefit if implemented, it is imperative that any plans for the Boardman Street intersection be looked at within the broader context of the Route 1A corridor.**

As requested by MassDOT, an alternatives analysis for Route 1A improvements is presented in Section 5.5.

FBIM 10 **As with the other potential Roadway Improvements listed in the ENF, we would like any long-term design changes at [Waldemar and Tomasello Drive to] be implemented after a Comprehensive Corridor Study is completed.**

Changes to improve safety and traffic operations at the Waldemar Avenue and Tomasello Drive intersections on Route 1A are included in all Route 1A improvement options presented in Section 5.5.

FBIM 11 **We ask that MEPA require the Proponent to show that service and commercial traffic will not have an auditory or visual impact on the Belle Isle Marsh, Belle Isle Creek, or Sales Creek.**

Noise levels in the marsh or creeks were not evaluated since relevant noise criteria do not apply at these locations. However, noise impacts at the closest residences to the east of the Resort along Bennington Street are discussed in Section 6.6.4.2. Results of these analyses indicate that predicted sound levels due to stationary mechanical equipment, increased traffic volumes, and temporary construction activities are not anticipated to cause a significant noise impact on the surrounding community, and, with appropriate mitigation, are expected to meet relevant noise limits at all noise-sensitive locations.

FBIM 12 **To ensure that service and other commercial vehicles employed by the Resort do not contribute to undue air pollution, we propose that the Proponent include an analysis of operating only "green" vehicles such as hybrid, electric, and compressed natural gas in its business operations.**

Although the number of Resort operational vehicles is small, the Proponent is committed to using alternatively-fueled vehicles in its shuttle fleet and possibly other on-site equipment such as carts and maintenance equipment as feasible.

FBIM 13 **We ask that the Proponent investigate requiring outside suppliers and transportation providers of the Resort to utilize green vehicles and report its findings in the DEIR. At the very least, suppliers and transportation providers, including Taxi companies, should be required to retrofit their vehicles with state of the art pollution control equipment such as emission control equipment, idle reduction technologies, and engine upgrades or replacements. Because this could be seen as a financial burden to some local suppliers, the Proponent should subsidize these efforts, making them affordable…**

The Proponent will encourage the use of alternative-fueled vehicles with companies directly subcontracted to work at the facility; however, there are no plans to mandate the use of such vehicles or subsidize conversion of fleet vehicles. The ground shuttle fleet to be used by the Proponent's shuttle provider is expected to be exclusively or nearly exclusively made up of green vehicles.

FBIM 14 **We ask that MEPA require that further Air Quality Analysis should be based on the number of parking spaces currently utilized at the existing Suffolk Downs site, not on the number of parking spaces currently available. Average peak occupancy of current available parking spaces is far less than the number of parking spaces at the existing Suffolk Downs site.**

Air quality analysis is performed based on vehicle activity (existing and projected) rather than numbers of parking spaces. Therefore, as suggested in this comment, the air quality analysis reflects the occupancy/utilization of the parking spaces rather than the number of spaces available.

FBIM 15 **We ask that MEPA also require that the DEIR crash analysis incorporate the impact of casino traffic on public safety, and commit to mitigate any issues that may arise from this analysis.**

A crash analysis is presented in Section 5.2.11. While there will be an increase in traffic on the roadway network supporting the Project site, this does not suggest a corresponding increase in crashes. Significant roadway, traffic, and pedestrian safety improvements will be provided by the Project, some of which address pre-exiting safety issues.

FBIM 16 **We ask that the Proponent work with the MBTA to assess additional capacity needs on the Blue Line and the bus lines servicing the Project site and include their findings in the DEIR. This evaluation should include late night service and the addition of express buses to and from the resort as needed. We encourage the Proponent to contribute financially to this increase in service if necessary... We ask that MEPA require the Proponent to report on scheduling additional express bus service to Downtown Boston and Wonderland Station during these peak special events [e.g., Revere Beach Sandsculpting Festival] in the DEIR.**

A comprehensive transit analysis in presented in Sections 5.2.1 and 5.8.1 for existing and future Build conditions, respectively.

FBIM 17 **To encourage use of public transportation, we believe that it is important to treat the connection between the Suffolk Downs MBTA station and the resort in a similar fashion to the Tomasello entrance. A shuttle service to and from the MBTA station is a bare minimum. We request that the Proponents consider additional**

improvements to this connection. These should include a seamless, sheltered pedestrian connection from the station and the resort reflecting the attention to detail and feel of the Tomasello Drive entrance…

In addition to enhancements to this shuttle service itself, significant pedestrian, bicycle, and streetscape/landscape improvements are described in Sections 1.0 and 4.0.

FBIM 18 We request that MEPA require the Proponent to provide an analysis in the DEIR of employer-sponsored TDM strategies… We request that the Proponent provide free MBTA Charlie Cards to all employees who use transit to get to work… Another consideration should be to provide onsite childcare to employees… Another consideration should be for the Proponent to offer prioritized vanpool and carpool parking spaces to employees…

A robust TDM plan is presented in Section 5.9.

FBIM 19 The Proponent states that they will explore the feasibility of shuttle services between the Project and Logan Airport, water transportation terminals, local and downtown hotels, downtown Boston, the Boston Convention and Exhibition Center (BCEC), the Black Falcon Cruise Terminal, and major tourist attractions. Where public transportation to and from these destinations is not feasible we encourage the inclusion of these shuttle services in the DEIR's TDM Analysis. We request that the Proponent include in this analysis the use of "green" shuttle services…

Multiple potential destinations are identified in the shuttle plan presented in Section 5.8.3.2. Shuttle service is also described in Section 1.1.1.2.

FBIM 20 We encourage the Proponent to ensure that the physical design of the casino is outward facing and welcoming to pedestrians, cyclists, and the community as a whole.

Section 4.0 describes the Project's urban design concepts. Sections 1.4 and 4.4.7 describes how the pedestrian and bicycle connections designed in concern with the rest of the Project are intended to be inviting from surrounding communities.

FBIM 21 We ask that MEPA require the Proponent to investigate and implement wherever possible best practices in cycling infrastructure, such as cycle tracks, bicycle signals, bicycle boxes and other leading-edge design elements, as detailed in the NACTO Urban Bikeway Design Guide in the DEIR. The Proponent should also include bicycle wayfinding signs in accordance with the Manual on Uniform Traffic Control Devices.

The Proponent will work with the cities of Boston and Revere to incorporate best practices in proposed bicycle infrastructure to the extent possible.

FBIM 22 **It is essential that the bike facility locations are sited so as to not only improve access to the Project site, but also to provide meaningful network linkages to the larger bicycle network. To this end, we request that MEPA require the Proponent to report on how it is coordinating with all stakeholders, including the MAPC, who is already coordinating efforts to create networks for safe non-vehicular traffic in Revere, Chelsea, Everett, Malden, Saugus and Lynn.**

Improvements for bicycle access to the Project site, as described in Sections 1.4 and 5.8.3, have been identified with a view to creating missing linkages.

FBIM 23 **We ask that MEPA strongly encourage the Proponent to explore sponsorship opportunities to bring the Hubway Bike Share system to East Boston and Revere on and around the Project site.**

The Project includes two Hubway stations, the locations for which were determined in coordination with BTD and representatives from the City of Revere. Infrastructure will be installed to support the two stations, and they will be deployed at the Proponent's cost when the City deploys its East Boston Hubway system. The Proponent is committed to active participation with local municipalities to encourage regional deployment of the bike share system to help alleviate traffic congestion in the area.

FBIM 24 **We ask MEPA to require the Proponent to include in its DEIR Pedestrian Access analysis how the Proponent may fund and facilitate the build-out of the East Boston Greenway to the Belle Isle Marsh and beyond, to Revere Beach.**

Section 4.1 describes the Resort's proximity to East Boston's network of open spaces.

FBIM 25 **In the ENF, the Proponent indicated "sidewalks are provided on the majority of the study area roadways, but the physical condition of sidewalks and ADA compliance is deficient in several locations, and appropriate pedestrian crossing accommodations are absent at many locations." We ask MEPA to require the Proponent to include in its DEIR analysis the undertaking and funding of a near-term Project to repair and upgrade these identified sidewalk deficiencies.**

Off-site sidewalk disrepair, ADA deficiencies, and missing pedestrian accommodations will be addressed as part of the proposed improvements under the HCAs.

FBIM 26 **To reinforce the stated goals to enhance pedestrian connections and circulation, we ask MEPA to encourage the Proponent to develop a robust pedestrian wayfinding system for the Project area and the surrounding community.**

The Project will provide robust wayfinding for pedestrians and bicycles throughout the site.

FBIM 27 **To truly lead the industry with the Suffolk Downs project, the Proponent must pursue LEED Platinum status rather than LEED Gold. We request that MEPA strongly encourage the Proponent to build Caesars Suffolk Downs as a LEED Platinum project and report the feasibility of this endeavor in the DEIR.**

As the Project design progresses, the Proponent shall continue to review and research the feasibility of the LEED credit points not currently listed as attempted that may enable the Project to attempt a LEED Platinum Certification. Section 2.2 includes a summary LEED NC 2009 scorecard demonstrating how Proponent will achieve LEED Gold Certification and a detailed analysis of the LEED NC 2009 prerequisites and credits the Project is targeting for achievement.

FBIM 28 **We ask MEPA to ensure the Proponents explore the use of permeable paving wherever possible on the site to further improve stormwater management, particularly in the parking areas and pedestrian spaces.**

Pervious pavement will be utilized, when appropriate, in pedestrian and plaza areas of the project. Pervious pavements will not be used along the main roadways and driveways or the surface parking areas due to the intensity of use.

FBIM 29 **Under the Expanded Gaming Law, applicants for gaming licenses are encouraged to procure or produce 10 percent of their annual electricity consumption from renewable sources. We ask that MEPA require the Proponent to include in the DEIR an analysis of generating on-site enough renewable energy to meet, at a minimum, this 10 percent suggestion. In addition, we would like the Proponent to provide an analysis of how it may cover 50% and 100% of its annual electricity consumption with onsite and procured renewable energy.**

The Project design includes installation of an approximately 2.7-MW PV array that will provide approximately 10% of the Resort's estimated annual electricity use. The Project owner will also purchase renewable energy certificates to provide green power for a portion of the Resort's electricity needs that are not generated on site. In combination, these efforts will account for approximately 45-50% of the Resort's estimated electricity requirements. The Project design also includes the installation of two 100 kW CHP units. In addition, designated areas will be incorporated into the Project design to address collection and storage of bio-waste from food production, which will be transported to an organics recycling center where it will be processed through an Anaerobic Digester Plant to produce electricity. As the design progresses, the Proponent will continue to assess additional areas for the installation of additional PV panels.

FBIM 30 **We encourage MEPA to require a comprehensive light pollution study to evaluate and recommend mitigation measures for all impacts of lighting planned for the Project, both interior and exterior, addressing issues of light trespass, over-illumination, and sky-glow.**

The Proponent is committed to providing a site lighting design based on Dark Sky policies and strategies. Cutoff fixtures with energy efficient LED lighting will be considered along sensitive residential edges such as the Orient Heights neighborhood. Newly created open spaces between Tomasello Drive and Orient Heights will be landscaped to create a natural buffer zone to minimize light pollution. The Proponent will achieve a LEED Gold rating from the USGBC. One of the key strategies for reducing energy is a comprehensive lighting design strategy. Please refer to Section 2.0 for detailed building and site design strategies. In addition to the proposed strategies for light mitigation, as the site and building design further develops the Proponent will provide a detailed impact analysis and outline further strategies to minimize the lighting impacts from the development to the surrounding abutters.

FBIM 31 **We also urge MEPA to require investigation of visual blight from signage in the Project area and surrounding communities.**

The Proponent is sensitive to its relationship with host and surrounding communities, and will work to ensure exterior signage and lighting provides visual aesthetics for the Resort without negatively impacting surrounding communities.

FBIM 32 **We ask that MEPA require the Proponent to include in the DEIR, in great detail, how construction of the Caesars Resort at Suffolk Downs will not negatively impact in any way the Belle Isle Creek, the Belle Isle Marsh, or any of the ACEC around the site.**

The Project will meet and exceed MassDEP Stormwater Management Guidelines regarding water quality treatment in critical areas. The Project will utilize LID BMPs including bioretention basins, bioswales, water quality swales, pervious pavers, and rainwater reuse tanks to improve the water quality of stormwater discharges to the Belle Isle Inlet and Rumney Marshes ACEC relative to existing conditions (see Section 9.3).

The minor on-site activities proposed in the Sales Creek RFA include proposed stormwater management system improvements and upgrades and construction of a small floodplain compensatory storage area adjacent to Sales Creek. Proposed upgrades to the stormwater management system, including any new or modified discharges, will be set back from Sales Creek and will comply with MassDEP stormwater standards. No work is anticipated to occur on or below the Inland Bank of Sales Creek or its adjoining BVW. Sedimentation and erosion controls, and a

clearly delineated limit of work setback, will protect these resource areas during construction. The proposed upgrades to the stormwater management system should substantially improve the quality of discharged water relative to existing conditions. As demonstrated in Section 6.9, these activities have been designed to fully comply with WPA performance standards.

Stormwater discharges during construction will be managed under a SWPPP prepared in accordance with the U.S. EPA NPDES Stormwater CGP and MassDEP stormwater regulations. Implementation of the SWPPP will incorporate sedimentation and erosion control measures and other BMPs. The Project should not result in any impacts to Belle Isle Creek or adjacent Salt Marsh areas located north and east of the Project site.

FBIM 33 **We encourage MEPA to require consideration of long-term funding for "green jobs" and "green job training" in the mitigation plan. Funding youth employment in conservation, such as Youth Conservation Corp (YCC) sponsored by Boston Natural Areas Network (BNAN) and creating training programs in the East Boston and Revere Communities, will both demonstrate the Proponent's commitment to sustainability and nurture environmental stewards within the community.**

As demonstrated herein, Caesars and Suffolk Downs maintain a deep commitment to sustainability and associated job creation. However, the Proponent is still evaluating which local programs it is possible to support.

FBIM 34 **We would like to ask MEPA for assurance that any mitigation agreements made with the Proponent will be required and perhaps even provided as a requirement of any related state permits.**

Proposed Section 61 Findings for each of the state agencies from which the Project is seeking permits are provided in Section 10.0. These proposed Section 61 Findings include by reference the proposed mitigation measures.

Subject: EEA No.15006

My written concerns regarding the proposal for a resort casino at Suffolk Downs, East Boston:

- The ability of Caesars to financially sustain its environmental infrastructure in the future, given its debt of over $20 billion **HLT 01**
- Past environmental infractions by Suffolk Downs -- will those be taken into account in the final MEPA report? Last summer, of course, Suffolk Downs was fined $1.25 million after it was discovered that for almost a decade, the racetrack discharged horse manure and other waste into local tributaries and the Boston Harbor. It has been shown that if a business offends once, it will offend again, so this should be noted in your report.
- Suffolk Downs estimated last summer in its initial traffic plans that a casino would produce 10,000-15,000 new car trips every day. In its most recent report, that number is close to 25,000 new car trips. This is a huge discrepancy, resulting in far more emissions. Can Suffolk explain this discrepancy? **HLT 02**
- The wellbeing of the horses: When casinos are added to race tracks, the purses increase, putting more pressure on jockeys and owners to run tired, injured, or old horses. At Aquaduct Race Track in Queens, this led to a 100% increase in horse deaths last year after slots were introduced the year before. (NYT story) **HLT 03**

Thank you for considering these concerns! Let me know if you have any questions.

Best,

Steve Holt

Journalist • Writer • Editor
T: 617-447-6519

HOLT, STEVE

HLT 01 **[I am concerned about] the ability of Caesars to financially sustain its environmental infrastructure in the future, given its debt of over $20 billion.**

Caesars is more than capable of meeting and exceeding its financial and environmental commitments, and is looking forward to developing and operating a world-class resort in Boston with its partners. The company has more than $2 billion cash on its balance sheet and has successfully financed and developed two projects in Ohio in the last two years and financed its Baltimore project earlier this year.

HLT 02 **Suffolk Downs estimated last summer in its initial traffic plans that a casino would produce 10,000-15,000 new car trips every day. In its most recent report, that number is close to 25,000 new car trips… Can Suffolk explain this discrepancy?**

This apparent discrepancy reflects confusion between patron cars and patron car trips. Each patron car generates two car trips, comprising the arrival and departure of that car.

HLT 03 **[I am concerned about] the wellbeing of the horse. When casinos are added to racetracks, the purses increase, putting more pressure on jockeys and owners to run tired, injured, or old horses.**

Suffolk Downs has a proven track record of commitment to the health and safety of its equine athletes both during their racing careers and after they have retired from racing. In a 2012 New York Times study, Suffolk Downs had one of the lowest rates of injury and breakdown in the country, ranking sixth among the 62 racetracks included in the study. The track has received full accreditation from the National Thoroughbred Racing Association's Safety and Integrity Alliance following a complete review of operations at the facility, and it strongly advocated for the Massachusetts Gaming Commission's decision to improve safety and testing standards in the state. Suffolk Downs currently employs two veterinarians to examine every horse before and after every race. In 2008, Suffolk Downs became the first racetrack in the country to implement a strict anti-slaughter policy for owners and trainers with horses stabled on its grounds. Virtually every major racetrack in the country has adopted a similar policy.

To: Buckley, Deirdre (EEA)
Subject: EEA No.15006 Suffolk Downs Casino

I am opposed to the casino for the following reasons:

- Traffic is already a nightmare with cars sitting and polluting the air constantly **HNT 01**
- Traffic mitigation is handled by an $80,000/year trooper operating the signals at Boardman St manually
- More cars=more pollution
- More visitors=more trash **HNT 02**

Regards,

Andrew Hunt
202.352.4579 -- cell

HUNT, ANDREW

HNT 01 **Traffic is already a nightmare with cars sitting and polluting the air constantly... Traffic mitigation is handled by an $80,000/year trooper operating the signals at Boardman Street manually.**

The traffic analysis in Section 5.5 demonstrates that Route 1A improvements will address existing traffic congestion over and above the impact of Project vehicle trips. It is expected that trooper operation of the signals at Boardman Street will be eliminated as a result of the improvements to be constructed on Route 1A.

HNT 02 **More visitors [will mean] more trash.**

The Proponent is committed to responsibly and sustainably handling and processing Project waste, as demonstrated in this filing.

Re: *Caesars Resort at Suffolk Downs, East Boston and Revere* (**EOEEA#15006**), and *Belle Isle Marsh Boardwalk* (**EOEEA#15015**)

Dear Secretary Sullivan:

On behalf of Mass Audubon, I submit the following comments on the Environmental Notification Form (ENF) for the proposed casino resort project at Suffolk Downs in Boston and Revere. The project requires preparation of a full Environmental Impact Report (EIR) as it triggers mandatory EIR thresholds for alteration of more than 50 acres of land and generation of more than 3,000 vehicle trips per day. It also triggers ENF thresholds for wastewater and work within an Area of Critical Environmental Concern (ACEC). The project is subject to review of energy consumption and associated emissions under the *Massachusetts Environmental Policy Act* (MEPA) *Greenhouse Gas* (GHG) *Emissions Policy and Protocol*. The EIR should be comprehensive and should include all existing and proposed development on the site and associated off-site projects including transportation improvements and any other projects such as the boardwalk at Belle Isle Marsh that was recently proposed under EEA #15015. Continued operation of the horse barns and associated management of horse waste on the site should be part of the EIR. There should be no segmentation of review of any aspect of the project.

Mass Audubon does not have a position on gambling, gaming, or casinos in general. We do, however, have serious concerns and a variety of suggestions regarding development of large scale destination-type resort casino complexes with a goal to avoid, minimize, and/or mitigate where possible the environmental impacts of such major development projects on the environment. The law that established gaming in Massachusetts (*Chapt. 194 of the Acts of 2011*) set mandatory and optional qualifying criteria for the Gaming Commission to consider when reviewing and deciding on gaming applications. Mass Audubon believes that, to the fullest extent possible, the highest standards of green development and sustainability should be required in all state and local licensing and permitting of gaming facilities.

The gaming law also requires the establishment of a Community Mitigation Fund. This fund should be equitably distributed to assist Boston, Revere and other appropriate surrounding communities in offsetting costs related to casino construction and operation. The EIR should fully document all impacts to surrounding communities and demonstrate the manner in which those impacts will be addressed.

Overview

The project site is comprised of 161 acres in the cities of Boston and Revere. The site is in a heavily urbanized environment with significant natural and built environmental constraints and sensitivities including Sales Creek and substantial areas of floodplain on the site; Belle Isle Marsh and the Rumney Marshes ACEC; already overburdened roadways; and adjacent industrial uses including tank farms. The site is served by the MBTA's Blue Line subway. The proposed project is a major gaming facility with associated amenities including two hotels with up to 450 guestrooms, 200,000 sf of gaming space, plus retail establishments, multi-purpose meeting and entertainment space, 16 restaurants, surface and structured parking, and support facilities including a central utility plant. There will be over 1.8 million sf of new development and the project will generate an estimated 24,600 vehicle trips per day.

The existing Suffolk Downs racecourse with associated horse stables and grandstand will remain and the existing clubhouse will be renovated. The ENF does not include the existing horse barns in the estimated amount of existing development. The EIR should be comprehensive and include analysis of all environmental impacts and mitigation including management of horse waste, which was the subject of a recent consent agreement between Sterling Suffolk Racecourse and the US Environmental Protection Agency (EPA.) **AUD 01**

Sustainable Design and Operation

The project proponent, Sterling Suffolk Racecourse, LLC is partnering with Caesars Entertainment in undertaking the project. Caesars has a corporate sustainability policy, *CodeGreen*, and the ENF indicates a commitment to build the project to a minimum of LEED Gold standard, including measures related to the guidelines for Sustainable Sites, Water Efficiency, Energy and Atmosphere, Materials and Resources, and Indoor Environmental Quality. The ENF describes proposed improvements to existing conditions including reconfiguration of parking to reduce the number of surface spaces and incorporate vegetative filtering areas to manage stormwater runoff. The ENF also includes commitments to work with MassDOT on improvements to roadways in the project vicinity along with improvement to pedestrian and bicycle access and connections to nearby open spaces and greenways. The EIR should fully document all proposed environmental and sustainability commitments including the proposed timing of off-site transportation improvements in relation to the on-site development. **AUD 02**

See also comments below regarding energy and GHG, floodplains and wetlands, water, wastewater, stormwater, landscaping, transportation, and connections to open spaces and greenways.

Bird-Friendly Design: Mass Audubon requests that the project be designed to meet the new LEED Pilot Credit for Bird Collision Deterrence (PC55). Bird collisions with buildings are a significant factor in bird mortality. Design features such as alternatives to large expanses of reflective glass on facades and the placement of landscape materials in relation to buildings can greatly influence the degree to which a facility is or is not a hazard to birds. Given the site's proximity to the Belle Isle and Rumney **AUD 03**

Marshes ACEC frequented by many migratory and resident birds, we urge that the project be designed in a manner that will maximize its habitat value while minimizing bird collision hazards.

Wildlife and Habitat; ACEC: The Suffolk Downs development plans should demonstrate to state and city officials how their casino development will avoid, minimize, and mitigate impacts to the adjacent Department of Conservation and Recreation (DCR) owned Belle Isle Marsh Reservation. Belle Isle is significant as a component of the state-designated Rumney Marsh ACEC and there may be opportunities to contribute to the Marsh's ongoing restoration project. AUD 04

SEP and Environmental Projects in Surrounding Area

Sterling Suffolk Racetrack recently agreed to fund three Supplemental Environmental Projects (SEPs) as part of a consent decree with EPA in relation to water quality violations under the *US Clean Water Act* from the Confined Animal Feeding Operation (CAFO) at the horse barns. Improvements were also made to drainage in the area of the horse barns to direct runoff contaminates with horse waste in the sewer system. The SEPs included $495,000 to the Mystic River Watershed Association for water quality monitoring and public education; $90,000 to the Saugus River Watershed Council for water quality monitoring and public outreach; and construction of a boardwalk and interpretive signage at DCR's Belle Isle Marsh Reservation. An ENF for the Belle Isle Marsh boardwalk was recently reviewed under EEA #15015.

The EIR for the Suffolk Downs Resort Casino should include commitments to ongoing support for environmental protection, restoration, and education projects in Boston, Revere, and surrounding communities. The project will have substantial, ongoing effects to the environment in the vicinity and it should provide continuing support for beneficial projects and initiatives consistent with the project scale. For example, the boardwalk will require maintenance; there is a continuing need for public education and interpretation of the natural resources in the surrounding marshes and waterways; the marshes and waterways would benefit from additional stormwater remediation and other restoration efforts; and the commitment to improving pedestrian and bicycle connectivity to the site will require substantial ongoing state and local partnerships over a period of years to meet the full potential. AUD 05

Energy and Greenhouse Gases

The ENF indicates that the project will be energy efficient and that renewable energy such as solar photovoltaic arrays will be incorporated into the design. The ENF also indicates a possibility of the proponent developing an anaerobic digester for processing of organic food waste and horse waste. The project is subject to the *MEPA GHG Emissions Policy and Protocol*. The EIR should fully document energy use and emissions from on-site equipment, off-site production of electricity (including energy used in providing water and wastewater treatment to the project), and transportation-related emissions. The EIR should document how the project will be designed and operated to minimize GHG emissions to the maximum extent feasible. AUD 06

Massachusetts has committed via the *Global Warming Solutions Act of 2008* to address climate change through mandated GHG emission reductions. The Commonwealth's goals are to reduce emissions by 25% by 2020 and 80% by 2050. For the past two years, the American Council for an Energy-Efficient Economy recognized Massachusetts as the number-one state in the nation for its leadership in energy-efficiency policies and programs in the residential, commercial, industrial, and transportation sectors.

The EIR should demonstrate how it will work in concert with the Commonwealth's GHG reduction and efficiency goals.

In advancing its *Climate Action Plan*, Mayor Menino and the City of Boston have also has made significant commitments to reduce GHG emissions *...through more efficient buildings and vehicles, lower-carbon fuels, reduced driving, more recycling, and other changes in behavior....* To implement the *Plan*, the Boston City Council amended Article 37 of the municipal zoning code to require that all large-scale projects meet the U.S. Green Building Council's LEED certification standards. Boston is the nation's first city to require a green building standard through municipal zoning requirements. The ENF indicates the project will comply with the state's Stretch Code and LEED energy efficiency guidelines, and the EIR should provide detailed information on that. Mayor Menino has also proposed that buildings over 50,000 sf annually report their energy consumption. We urge that the Suffolk Downs casino cooperate with the Mayor by making a commitment to provide to the city and public annual energy audits, irrespective of a mandatory requirement. AUD 07 AUD 08

Water Resources

Wetlands and Floodplains: The EIR should include maps and narrative information delineating all coastal and inland wetland resources on the site or affected by the project including proposed off-site transportation improvements. The site contains historically filled, channeled, and culverted areas of wetlands associated with Sales Creek. Those areas should also be mapped. In addition, the EIR should demonstrate how any of those areas are subject to the standards of the *Massachusetts Public Waterfront Act* (MGL Chapt. 91.) The project design should show a restoration of the functionality and connectivity of area wetland resources, improved water quality over existing conditions to the maximum extent feasible, and provide for proper public access where safe and feasible. AUD 09 AUD 10 AUD 11

The project site contains extensive areas of floodplain. The ENF indicates that areas on the site within the 100-year floodplain may be classified as Bordering Land Subject to Flooding (BLSF) or Land Subject to Coastal Storm Flowage (LSCSF) depending on characteristics pursuant to the *Wetlands Protection Act* regulations. For purposes of the ENF, it is assumed that the floodplain on the site is classified as BLSF, consistent with two existing Orders of Conditions for the site. The performance standards for BLSF are more stringent than for LSCSF, and compensatory flood storage is required for BLSF. Compensatory storage is not required for filling of LSCSF, since it is assumed that fill affecting the ocean will have an imperceptible impact on flood levels. Fill in BLSF does require compensation to prevent increasing flooding effects on adjacent areas. Mass Audubon supports the Boston and Revere conservation commissions' determinations that floodplain areas on the site are classified as BLSF and that compensatory flood storage is required for any fill. The EIR should identify the locations and elevations of all areas of floodplain fill and associated compensatory storage areas. It should demonstrate that the compensatory areas will function to offset the proposed fill in each location based on localized flow patterns and elevations within and adjacent to the site. AUD 12

The ENF indicates that nearly 500,000 sf of floodplain will be altered for the project. A large amount of fill is proposed along the main access roadway to elevate it above storm surges based on predicted sea level rise. This will improve resilience of the site design in regard to climate change and storm surge events. Given the fact that the creeks and drainage ditches on and adjacent to the site flow through a developed and constricted landscape, it is important that any changes to the floodplain and flow patterns be carefully designed to avoid redirecting increased flood flows to adjoining properties. The EIR should AUD 13

include a detailed analysis of hydrology and flow patterns within and around the site pre- and post-construction.

Off-site transportation improvements to address traffic congestion associated with the project are proposed. The EIR should document wetlands impacts associated with those improvements, and should present an analysis of measures to avoid, minimize, and mitigate those impacts. AUD 14

Stormwater and Water Quality Improvement: Surface parking on the site will be reduced and reconfigured, and there will be a net decrease of nine acres of impervious surface. Stormwater from post-construction impervious areas will be filtered through extensive areas of vegetative filtration plantings. This should result in improved water quality. The EIR should also evaluate the potential for restoring more natural flow patterns and/or daylighting of creeks historically filled on or near the site.

The ENF indicates a commitment by the proponent to work with MassDOT and to assist with funding for several potential off-site transportation improvements. The evaluation of these improvements should include plans for achieving a significant net improvement in the water quality in stormwater runoff from those roadways. AUD 15

Water Conservation and Reuse: The ENF indicates that the project will increase water consumption at the site by an estimated 380,000 gallons per day over existing use. Landscape irrigation is projected to utilize 58,000 gallons per day. Water conservation will be achieved through installation of efficient plumbing fixtures and other typical conservation measures. The EIR should fully evaluate all potential measures to minimize water use and generation of wastewater including innovative methods such as maximizing use of stormwater for irrigation and reuse of grey water on-site. The goal for landscape use of potable water should be as close to zero as possible once plantings are established. AUD 16

Landscaping plants should be non-invasive yet resilient in order to minimize the need for irrigation, fertilizer, and energy use associated with landscape maintenance. Selection of species for planting should include consideration of salt tolerance, especially in areas likely to be subject to coastal storm surge events. AUD 17

Wastewater: The ENF indicates that the project will generate an estimated 307,000 gallons per day of wastewater above the existing 166,000 gallons per day (of which 150,000 gallons is from the CAFO.) Improvements are proposed to the local sewer system including a new pump station. The EIR should fully evaluate potential for reduction in generation of wastewater through water use efficiencies. AUD 18

Transportation

The project will generate over 24,000 new vehicle trips per day in a location where the local roadway network is already operating well above capacity. Addressing the transportation systems for the project is perhaps the most challenging topic to be addressed in the EIR. Route 1A is already one of the most congested highways in the Commonwealth as it is not only a busy urban throughway but is the most common route from north of Boston travelers heading to Logan International Airport. The EIR should fully document all transportation-related improvements and mitigation including Transportation Demand Management (TDM), enhanced access to subway and other transit options, and pedestrian and bicycle access within the site and connecting to off-site roads/sidewalks, open spaces and greenways. AUD 19

The proposed Suffolk Downs casino should coordinate with the MBTA to provide additional public transportation, Blue Line, bus, and regional ride-share opportunities. A cars-per-day quota should also be set to reduce traffic congestion and carbon emissions. AUD 20

Solid Waste

The EIR should document anticipated solid waste streams from the project and demonstrate a commitment to the highest possible standards for waste reduction, minimization, and recycling. The potential for the project to develop an anaerobic digestion facility to manage organic waste from the restaurants and horse manure should be evaluated. We encourage the proponent to work with government agencies and local businesses regarding the possibility of an anaerobic digester meeting shared needs and providing efficiencies of scale. This aspect of the project has the potential to convert waste to energy and to be a demonstration project for the application of such technologies in Massachusetts. AUD 21 AUD 22

Thank you for considering these comments when issuing the Scope for the EIR for this major resort casino project.

Sincerely,

John J. Clarke
Director of Public Policy and Government Relations

Mass Audubon works to protect the nature of Massachusetts for people and wildlife. Together with more than 100,000 members, we care for 35,000 acres of conservation land, provide school, camp, and other educational programs for 225,000 children and adults annually, and advocate for sound environmental policies at local, state, and federal levels. Founded in 1896 by two inspirational women who were committed to the protection of birds, Mass Audubon has grown to become a powerful force for conservation in New England. Today we are respected for our science, successful advocacy, and innovative approaches to connecting people and nature. Each year, our statewide network of wildlife sanctuaries welcomes nearly half a million visitors of all ages, abilities, and backgrounds and serves as the base for our work. To support these important efforts, call 800-AUDUBON (283-8266) or visit www.massaudubon.org.

Protecting the Nature of Massachusetts

AUD 01 **The ENF does not include the existing horse barns in the estimated amount of existing development. The EIR should be comprehensive and include analysis of all environmental impacts and mitigation including management of horse waste…**

The horse barn area is included within the total acreage of the Project site and is included in environmental impacts and analysis.

AUD 02 **The EIR should fully document all proposed environmental and sustainability commitments including the proposed timing of off-site transportation improvements in relation to the on-site development.**

The narrative provided in this document identifies and describes the numerous sustainability design measures and mitigation measures included in the Project. The timing of off-site transportation improvements in relation to the on-site development is addressed in the HCAs.

AUD 03 **Mass Audubon requests that the Project be designed to meet the new LEED Pilot Credit for Bird Collision Deterrence (PC55)… Design features such as alternatives to large expanses of reflective glass on facades and the placement of landscape materials in relation to buildings can greatly influence the degree to which a facility is or is not a hazard to birds.**

As Project design progresses, the Proponent will continue to study the possibility and feasibility of incorporating design features into the Resort façade with the goal of minimizing the collision hazard to birds (see Sections 4.3.3.1 and 4.3.3.2).

AUD 04 **The Suffolk Downs development plans should demonstrate to state and city officials how their casino development will avoid, minimize, and mitigate impacts to the adjacent DCR-owned Belle Isle Marsh Reservation.**

The minor on-site activities proposed in the Sales Creek RFA include proposed stormwater management system improvements and upgrades and construction of a floodplain compensatory storage area adjacent to Sales Creek. Proposed upgrades to the stormwater management system, including any new or modified discharges, will be set back from Sales Creek and will comply with MassDEP stormwater standards. No work is anticipated to occur on or below the Inland Bank of Sales Creek or its adjoining BVW. Sedimentation and erosion controls, and a clearly delineated limit of work setback, will protect these resource areas during construction. The proposed upgrades to the stormwater management system should substantially improve the quality of discharged water relative to existing conditions. As demonstrated in Section 6.9, these activities have been designed to fully comply with the Wetlands Protection Act performance standards.

Stormwater discharges during construction will be managed under a SWPPP prepared in accordance with the U.S. EPA NPDES Stormwater CGP and MassDEP stormwater regulations. Implementation of the SWPPP will incorporate sedimentation and erosion control measures and other BMPs. The Project should not result in any impacts to Belle Isle Creek or adjacent Salt Marsh areas located north and east of the Project site.

AUD 05 **The EIR for the Suffolk Downs Resort Casino should include commitments to ongoing support for environmental protection, restoration, and education projects in Boston, Revere, and surrounding communities. The Project will have substantial, ongoing effects to the environment in the vicinity and it should provide continuing support for beneficial projects and initiatives consistent with the Project scale. For example, the boardwalk will require maintenance; there is a continuing need for public education and interpretation of the natural resources in the surrounding marshes and waterways; the marshes and waterways would benefit from additional stormwater remediation and other restoration efforts; and the commitment to improving pedestrian and bicycle connectivity to the site will require substantial ongoing state and local partnerships over a period of years to meet the full potential.**

Section 1.4 describes pedestrian and bicycle connectivity surrounding the Project. The proposed stormwater management system, as described in Section 9.3, will improve the water quality of stormwater discharges to Sales Creek, and ultimately to Belle Isle Inlet and the Rumney Marshes ACEC.

AUD 06 **The EIR should fully document energy use and emissions from on-site equipment, off-site production of electricity (including energy used in providing water and wastewater treatment to the Project), and transportation-related emissions. The EIR should document how the Project will be designed and operated to minimize GHG emissions to the maximum extent feasible... The EIR should demonstrate how it will work in concert with the Commonwealth's GHG reduction and efficiency goals.**

A comprehensive GHG emissions analysis is provided in Section 7.0.

AUD 07 **The ENF indicates the Project will comply with the state's Stretch Code and LEED energy efficiency guidelines, and the EIR should provide detailed information.**

Stretch Code compliance is addressed in the GHG emissions analysis provided in Section 7.0, and LEED credits and certification are discussed in Section 2.2.

AUD 08 **Mayor Menino has proposed that buildings over 50,000 square feet annually report their energy consumption. We urge that the Suffolk Downs casino cooperate with the Mayor by making a commitment to provide the city and public annual energy audits, irrespective of a mandatory requirement.**

Metering and reporting is already required as part of the LEED certification.

AUD 09 **The EIR should include maps and narrative information delineating all coastal and inland wetland resources on the site or affected by the Project including proposed off-site transportation improvements.**

Sections 6.9.1 and 6.9.2 describe on-site and off-site wetland resource areas, respectively.

AUD 10 **The site contains historically filled, channeled, and culverted areas of wetlands associated with Sales Creek. Those areas should also be mapped. In addition, the EIR should demonstrate how any of those areas are subject to the standards of the *Massachusetts Public Waterfront Act* (MGL Chapt. 91).**

As described in Section 5.2 of the ENF, in a determination dated June 23, 2000, MassDEP concluded that the filled portions of the Project site constitute landlocked tidelands, and therefore the site is not subject to Chapter 91 Licensing jurisdiction. Chapter 168 of the Acts of 2007 confirmed the validity of such previously-issued determinations from MassDEP, and MassDEP also reaffirmed the determination in its comment letter on the ENF. A request for a Public Benefit Determination is included in Section 6.7 of this DEIR/EPNF.

AUD 11 **The Project design should show a restoration of the functionality and connectivity of area wetland resources, improved water quality over existing conditions to the maximum extent feasible, and provide for proper public access where safe and feasible.**

The Project will meet and exceed MassDEP Stormwater Management Guidelines regarding water quality treatment in critical areas. The Project will utilize LID BMPs including bioretention basins, bioswales, water quality swales, pervious pavers, and rainwater reuse tanks to improve the water quality of stormwater discharges to the Belle Isle Inlet and Rumney Marshes ACEC see Section 9.3).

Information demonstrating compliance with WPA performance standards is provided in Section 6.9. Proposed upgrades to the existing stormwater management system, coupled with a reduction of approximately 12 acres in impervious surfaces on the Project site, will significantly improve water quality discharging towards Sales Creek relative to existing conditions. Public access and connectivity throughout the site is described in Section 1.4.

AUD 12 **The EIR should identify the locations and elevations of all areas of floodplain fill and associated compensatory storage areas. It should demonstrate that the compensatory areas will function to offset the proposed fill in each location based on localized flow patterns and elevations within and adjacent to the site.**

The Project includes grading work within the 100-year floodplain that will consist of cutting and filling. A floodplain compensation area will be provided in the vicinity of the Project entrance. The Project will not result in any net filling of the 100-year floodplain; Section 2.3.5 summarizes floodplain cuts and fills.

The locations of proposed impacts to BLSF and compensatory flood storage areas are described in Section 6.9.1. Compensatory flood storage will be provided for all flood storage volume that will be permanently lost as a result of the Project. The volume will be created in an area not previously used for flood storage and will be incrementally equal to the theoretical volume of flood water lost at each elevation, up to and including the 100-year flood elevation, which will be displaced by the Project.

AUD 13 **Given that the creeks and drainage ditches on and adjacent to the site flow through a developed and constricted landscape, it is important that any changes to the floodplain and flow patterns be carefully designed to avoid redirecting increased flood flows to adjoining properties. The EIR should include a detailed analysis of hydrology and flow patterns within and around the site pre- and post-construction.**

Attachment F contains a drainage summary report that includes existing and proposed conditions drainage conditions. Section 9.3 describes proposed stormwater management.

AUD 14 **Off-site transportation improvements to address traffic congestion associated with the Project are proposed. The EIR should document wetlands impacts associated with those improvements, and should present an analysis of measures to avoid, minimize, and mitigate those impacts.**

Potential impacts to off-site wetlands are described in Section 6.9.2.

AUD 15 **The ENF indicates a commitment by the Proponent to work with MassDOT and to assist with funding for several potential off-site transportation improvements. The evaluation of these improvements should include plans for achieving a significant net improvement in the water quality in stormwater runoff from those roadways.**

Commitments to sustainable design principles for off-site improvements are described in Section 5.5.8.

AUD 16 **The EIR should fully evaluate all potential measures to minimize water use and generation of wastewater including innovative methods such as maximizing use of stormwater for irrigation and reuse of grey water on-site. The goal for landscape use of potable water should be as close to zero as possible once plantings are established.**

The Project includes three rainwater harvesting tanks that will collect stormwater from the building rooftops. Water collected in the tanks will be used for landscape irrigation, track watering, and cooling tower water demand. See Section 9.3 for a discussion of stormwater management; water conservation measures are described in Section 9.2.3.

AUD 17 **Landscaping plants should be non-invasive yet resilient in order to minimize the need for irrigation, fertilizer, and energy use associated with landscape maintenance. Selection of species for planting should include consideration of salt tolerance, especially in areas likely to be subject to coastal storm surge events.**

Sections 4.4 and 4.5 describe plant selections to minimize irrigation and chemical fertilizer needs as well as salt tolerance.

AUD 18 **The EIR should fully evaluate potential for reduction in generation of wastewater through water use efficiencies.**

Potable water demand in the facility itself will be reduced via low-flow fixtures (i.e., fixtures using less water than allowed by code): low-flow fixtures will be used throughout the facility, including in hotel guest rooms; waterless urinals will be used in public spaces, including the podium.

AUD 19 **The EIR should fully document all transportation-related improvements and mitigation including TDM, enhanced access to subway and other transit options, and pedestrian and bicycle access within the site and connecting to off-site roads/sidewalks, open spaces and greenways.**

Physical transportation-related improvements are documented in Sections 5.5 and 5.6. TDM and supporting key transit, pedestrian, and bicycle elements are documented in Section 5.9.

AUD 20 **The proposed Suffolk Downs casino should coordinate with the MBTA to provide additional public transportation, Blue Line, bus, and regional ride-share opportunities. A cars-per-day quota should also be set to reduce traffic congestion and carbon emissions.**

As part of the TDM plan described in Section 5.9, the Proponent has committed to working with MBTA, MassRides, Massport, and other entities to identify additional transit and rideshare opportunities.

AUD 21 **The EIR should document anticipated solid waste streams from the Project and demonstrate a commitment to the highest possible standards for waste reduction, minimization, and recycling.**

Solid waste and recycling are addressed in Section 6.11.

AUD 22 **The potential for the Project to develop an anaerobic digestion facility to manage organic waste from the restaurants and horse manure should be evaluated.**

Anaerobic digestion is evaluated in the context of the GHG analysis in Section 7.2.8.

Boston, MA 02114

Re: EEA 15006, Caesars Resort at Suffolk Downs ENF\

Dear Secretary Sullivan:

The Mystic River Watershed Association (MyRWA) appreciates this opportunity to comment on the Environmental Notification Form filed for the proposed Caesars Resort Casino at Suffolk Downs Racetrack in Boston and Revere.

The Mystic River Watershed Association is a 501(c)(3) nonprofit organization founded in 1972 by a group of concerned citizens. MyRWA's mission is to protect and restore clean water and related natural resources in the basin's 22 communities and to promote responsible stewardship of our natural resources through educational initiatives. A small organization, MyRWA accomplishes its mission by forging links with citizens' groups, universities, businesses and government agencies. These alliances permit MyRWA to work throughout the watershed, documenting current conditions and advocating for resource management and protection. This collaborative approach has created a strong watershed voice and is helping to attract much-needed public and private resources to the Mystic.

As an environmental organization MyRWA is particularly attuned to how proposed projects will improve existing conditions within urbanized areas. MyRWA notes that the ENF was comprehensive and thoughtfully prepared and particularly applauds the proponent for including consideration of:

- Integration of LID techniques into the proposed design,
- A commitment for LEED certification for the project,
- A decrease of approximately 13% (9 acres) of impervious cover on the site,
- Improvements to the existing stormwater collection, treatment, and conveyance systems,
- Protection of the Rumney Marsh (Sales Creek) ACEC,
- Consideration of the implications of sea level rise on the area, and
- Consideration of pedestrian, bicycle, mass transit, and waterborne access to the site.

We look forward to seeing details in the DEIR for these and other commitments made in the ENF. We expect your scope for the DEIR to include requirements for design details, appropriate modeling and calculations, and subject area firm commitments on mitigation measures that will help enhance and protect the human and natural environment.

In addition we offer specific comments in the following areas:

Traffic and Transportation

The DEIR should clarify if traffic counts were obtained during races or other events at the racetrack. If not, what would be the impact on the study area if events at the racetrack and the casino were to overlap? The DEIR should also clarify if the existing peak hour turning movement counts obtained in June 2010 were seasonally adjusted. **MRWA 01**

Detailed intersection capacity and LOS analysis for future condition with traffic mitigation should be included in the DEIR for all the study intersections. Conceptual mitigation plans should show roadway widening and drainage impacts clearly. **MRWA 02** **MRWA 03**

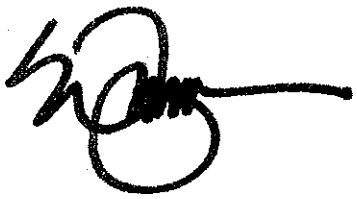
Due to the unique nature of the proposed project, the DEIR should include a commitment to monitor project generated traffic and impacts at critical intersections over a number of years beyond completion and occupancy. **MRWA 04**

The DEIR should give further consideration to improving mass transportation access to the site as opposed to simply relying on the existing Blue Line stops and roadway network. Installing a people mover between the T stop and the casino, further investigation of the potential for watercraft/ferry access to the area, and details on potential resort-supplied vanpools from key transit centers would help lessen the impact of traffic on already congested roadways. **MRWA 05**

Wetland Resource Areas/Floodplains

The floodplains on the site have been regulated as Bordering Land Subject to Flooding (BLSF) under the Wetlands Protection Act in the past by both Boston and Revere Conservation Commissions, and should be analyzed as such in the DEIR. Sales Creek and the onsite ditches have Inland Bank and Land Under Water which, technically, should be bound by BLSF. Land Subject to Coastal Storm Flowage (although listed in the Wetland Protection Act and Regulations) does not have performance standards in the regulations against which to judge impact. Since the Proponent intends to impact the floodplain, a BLSF analysis of mitigation required for storage and/or flow disruption per 310 CMR 10.57 should be provided in the DEIR.

Since the Proponent intends to modify floodplain will they be filing a Letter of Map Amendment or Letter of Map Revision with FEMA to reflect the changes in the floodplain? These changes, and any offsite changes they cause, should be memorialized in the FIA mapping for the area. **MRWA 06**



20 Academy Street, Suite 306 • Arlington, MA • 02476-6401 • (781) 316-3438 • www.MysticRiver.org

ACEC/Stormwater Quality

MyRWA asks that the same considerations EEA expressed for water quality improvement/protection that were listed in the Secretary's Certificate on the ENF for EEA 14747 (Suffolk Downs Stabling Area and Racecourse Stormwater Improvements) be incorporated into the design of the stormwater system proposed for discharge to the Rumney Marsh ACEC under the current proposal. The DEIR should detail how the newly proposed system improves upon the concepts presented, and those implemented, in the EEA 14747 project. **MRWA 07**

Thank you again for this opportunity to comment on this significant project proposal. If you have any questions or require additional information please contact me at (781) 316-3438 or at EK@mysticriver.org

Sincerely,

EkOngKar Singh Khalsa, Executive Director
Mystic River Watershed Association

MYSTIC RIVER WATERSHED ASSOCIATION

MRWA 01 **The DEIR should clarify if traffic counts were obtained during races or other events at the racetrack. If not, what would be the impact on the study area if events at the racetrack and the casino were to overlap? The DEIR should also clarify if the existing peak hour turning movement counts obtained in June 2010 were seasonally adjusted.**

As described in Section 5.2.7, all traffic counts were reviewed and validated by MassDOT as representative of existing 2012/2013 conditions. The counts were performed during the racing season.

MRWA 02 **Detailed intersection capacity and LOS analysis for future condition with traffic mitigation should be included in the DEIR for all the study intersections.**

Detailed capacity and LOS for future conditions for the entire study are presented in Sections 5.5 and 5.7.

MRWA 03 **Conceptual mitigation plans should show roadway widening and drainage impacts clearly.**

Roadway widening is indicated in all concept plans for off-site improvements. Drainage will be addressed in coordination with MWRA, MassDOT, DCR, and the cities of Revere and Boston, as appropriate, in the design development process.

MRWA 04 **Due to the unique nature of the proposed Project, the DEIR should include a commitment to monitor Project-generated traffic and impacts at critical intersections over a number of years beyond completion and occupancy.**

Commitments to monitoring, to be coordinated with MassDOT and BTD, are identified in Section 5.9.5.

MRWA 05 **The DEIR should give further consideration to improving mass transportation access to the site as opposed to simply relying on the existing Blue Line stops and roadway network.**

The TDM plan includes strategies to improve mass transit access and encourage its use (see Section 5.9). The Proponent has committed to providing an MBTA bus stop on site (should the MBTA wish to route bus service through the site) and to enhancing the existing shuttle service between Suffolk Downs Station and Resort lobbies.

MRWA 06 **Since the Proponent intends to modify floodplain will they be filing a Letter of Map Amendment or Letter of Map Revision with FEMA to reflect the changes in floodplain?**

A Letter of Map Amendment is not necessary for performing work in the floodplain.

MRWA 07 **MyRWA asks that the same considerations EEA expressed for water quality improvement/protection that were listed in the Secretary's Certificate on the ENF for EEA 14747 (Suffolk Downs Stabling Area and Racecourse Stormwater Improvements) be incorporated into the design of the stormwater system proposed for discharge to the Rumney Marshes ACEC under the current proposal. The DEIR should detail how the newly-proposed system improves upon the concepts presented, and those implemented, in the EEA 14747 project.**

The Project will meet and exceed MassDEP Stormwater Management Guidelines regarding water quality treatment in critical areas. The Project will utilize LID BMPs including bioretention basins, bioswales, water quality swales, pervious pavers, and rainwater reuse tanks to improve the water quality of stormwater discharges to the Belle Isle Inlet and Rumney Marshes ACEC (see Section 9.3).

RE: Environmental Impacts of the Proposed Casino at Suffolk Downs

Dear Secretary Sullivan:

On behalf of the residents of East Boston, we are pleased to submit our comments in response to the Environmental Notification Form (ENF) filed by Suffolk Downs and Caesars Entertainment (hereinafter "Suffolk Downs") related to a proposed casino complex at the current site of the Suffolk Downs Racetrack.

Rich in history and tradition, East Boston is home to hard-working families and small business owners from every corner of the globe. No Eastie Casino is a grassroots, all-volunteer effort that works to educate East Bostonians about the full range of impacts that the proposed Caesars Entertainment casino complex would have on our neighborhoods and small businesses.[1] We believe in positive economic growth that honors the community's history and diversity; enhances the quality of life for all residents; and promotes healthy, environmentally sustainable opportunities for economic growth that support our small business culture and family-friendly streets. We write today to express our concerns about the long-term environmental impacts of the proposed casino complex and share our recommendations for further state review. (We plan to share these recommendations with the City of Boston, as well.)

First, we are very concerned that the long-term environmental and related public health harms for the proposed casino complex outweigh the projected benefits of additional revenue to the Commonwealth of Massachusetts and the City of Boston. To cite one example, the ENF filed by Caesars and Suffolk Downs states that the casino complex will more than double the number of vehicle trips per day, resulting in 14,782,500 vehicle trips through our neighborhood *per year*, or 40,500 vehicle trips per day.[2] Given the association between air pollution, traffic, and chronic **NEC 01**

[1] While our effort is focused on East Boston, we acknowledge that the environmental impacts of the proposed casino complex are likely to extend to the neighboring communities of Chelsea and Winthrop, which have limited protections under the Massachusetts gaming law compared to East Boston and Revere. See Mass. Gaming Commission definitions of host and surrounding communities: http://massgaming.com/about/host-surrounding-communities

[2] These projected numbers stand in contrast to the 15,900 daily vehicle trips currently associated with the site, which amount to 5,730,500 annual vehicle trips. See Environmental Notification Form, Suffolk Downs, page 3.

diseases such as asthma, the increase in vehicle trips related to the proposed casino complex is alarmingly high. Asthma – which disproportionately impacts low-income communities and communities of color – comes with significant economic costs to the local economy, resulting in missed work days, higher rates of hospital use (including higher uncompensated care costs for uninsured and underinsured patients), and even premature death. According to state and local public health officials, the communities of Boston, Chelsea, Revere and Winthrop already have the second highest asthma rates in the Commonwealth.[3] Further, the five-year average death rate due to asthma is higher in these communities than it is in the Commonwealth as a whole.[4] We are concerned that the proposed number of additional vehicle trips brought into the community by the proposed casino complex will negatively impact residents' health and increase rates of disease at levels that are unsustainable for family, employer, and health provider budgets. Given the scope of the proposed casino complex and its impact on air, noise, light, and water quality in a densely populated urban neighborhood, other health issues with economic consequences for families, health care providers and employers may also arise.

Second, we note that East Boston residents already face an incredibly high environmental burden and pollution risks due to factors external to the proposed casino, including the following: **NEC 02**

- The neighborhood's proximity to Logan Airport and related commercial traffic;
- Existing Route 1A and tunnel traffic;
- A plethora of fuel storage facilities;
- A proposed plan by Global Oil to transport ethanol, a highly dangerous and flammable substance, through the area by train; and
- Prior degradations in the environment caused by existing Suffolk Downs Racetrack operations, such as the Concentrated Animal Feeding Operation (CAFO) housed at the existing site, which was cited for violations of the U.S. Environmental Protection Act in 2012.[5]

We believe that the Commonwealth should not consider the environmental impacts of the Suffolk Downs proposal in a vacuum, but should request information from Suffolk Downs that fully captures the context in which the casino complex would be cited.

---

[3] "Burden of Asthma in Massachusetts," Department of Public Health, Asthma Prevention and Control Program, April 2009, http://www.mass.gov/eohhs/docs/dph/com-health/asthma/burden-in-mass.pdf, page 13.

[4] The five-year average death rate due to asthma was higher in CHNA 19 [Boston, Chelsea, Revere, Winthrop] : Alliance for Community Health (16.8 per 1,000,000 residents) than the overall statewide rate (10.5 per 1,000,0000 residents). See "Burden of Asthma in Massachusetts," Department of Public Health, Asthma Prevention and Control Program, April 2009, http://www.mass.gov/eohhs/docs/dph/com-health/asthma/burden-in-mass.pdf, page 14.

[5] We note with interest that the Suffolk Downs stable constitutes the only known CAFO in the Commonwealth, and that Suffolk Downs entered into a consent decree with the U.S. Environmental Protection Agency in October 2012 for unauthorized discharge of animal waste into Sales Creek and adjacent wetlands, in violation of federal law. See ENF, Section 2.1.1.

We recommend that the Commonwealth request the following from Suffolk Downs and Caesars Entertainment:

- A detailed impact assessment—including a health impact assessment—of the proposed casino complex on East Boston residents that includes: (a) estimated financial costs for East Boston residents, medical, and social service providers; and (b) strategies for addressing harms directly or indirectly related to the development; **NEC 03**
- A detailed analysis of the *cumulative* environmental burden on East Boston that accounts for the existing private and commercial traffic, the proximity to Logan Airport, and the proximity of fuel storage facilities, in addition to the proposed impacts of the Suffolk Downs and Caesars casino complex; **NEC 04**
- A detailed analysis and plan to reduce vehicle traffic through East Boston that includes, but is not limited to, alternative means of transportation such as pedestrian access, bike, water, and public transportation; **NEC 05**
- A comprehensive parking and traffic analysis that includes a review of the impact on residential parking access and use of local roads by taxis, shuttle services, and single occupancy vehicles; **NEC 06**
- A detailed impact analysis and strategies to address significant increases in light and noise pollution on abutters, including the Orient Heights residential neighborhood; **NEC 07**
- A plan for monitoring and adequately addressing litter associated with advertisement campaigns, casino operations, and additional foot/vehicular traffic through local neighborhoods; **NEC 08**
- A detailed description and analysis of alternatives in addition to the "Build" or "No Build" options listed in the ENF that would adhere to the environmental history and/or agricultural use of the land while addressing community needs, building local wealth and addressing harms caused by the current structures (for example, creating space for a year-round farmers' market that accepts WIC and SNAP; allocating space for an urban garden; or modeling efforts such as the Green City Growers business model started by Cleveland's Evergreen Cooperative[6]; rooftop farming[7]); **NEC 09**
- A detailed consideration of energy and water conservation and alternative energy measures and the use of sustainable building materials **NEC 10**
- Evaluation of local and regional air quality impacts; **NEC 11**
- Analysis on soil and hazardous materials, stormwater management, sea level rise, and storm surge preparedness; and **NEC 12**
- Detailed recommendations for ongoing public reporting and community engagement over the proposed 100-year life of the Project. **NEC 13**

[6] http://evergreencooperatives.com/business/green-city-growers/
[7] http://www.takepart.com/article/2013/01/13/next-epicenter-sustainable-organic-farming-ischina

Finally, we are concerned that the results of a full Environmental Impact Review (EIR)—including detailed public information on the impacts, costs, and value of any proposed mitigation—may not be made available to the public prior to the release of a signed mitigation agreement between the developer and the City of Boston. Under the Massachusetts Gaming Law, the release of a signed agreement triggers a required vote in the host community within 60-90 days. While we recognize the limited scope of the Executive Office of Energy and Environmental Affairs (EEA) review, we feel we must acknowledge the current lack of transparency about long-term costs associated with negative impacts. Thus far, there has not been any *independent* overall analysis of the environmental, economic, and public health impacts of the casino complex on East Boston and surrounding communities. Further, the regulatory structure regarding civil and criminal penalties, licensure requirements, discipline, and enforcement remains incomplete. East Boston residents who wish to evaluate the casino proposal in an objective manner are at a significant disadvantage due to the lack of this important analysis and regulatory information. Therefore, we ask the Commonwealth to proceed quickly through the EIR process. The public release of the results of a full Environmental Impact Review will go a long way towards helping East Boston residents make informed decisions on the casino proposal. **NEC 14**

Again, we thank you for the opportunity to comment on this crucial matter. Please contact Jessica Curtis at jesscurtis@gmail.com with any questions.

Yours sincerely,

Jessica Curtis

Mike Russo

Volunteer with No Eastie Casino

cc: Boston Host Community Advisory Committee c/o Elizabeth Dello Russo

NEC 01 **The ENF filed by Caesars and Suffolk Downs states that the casino complex will more than double the number of vehicle trips per day, resulting in 14,782,500 vehicle trips through our neighborhood per year, or 40,500 trips per day. Given the association between air pollution, traffic, and chronic diseases such as asthma, the increase in vehicle trips related to the proposed casino complex is alarmingly high.**

The Project vehicle trip generation, including its temporal distribution over the 24-day, is presented in Sections 5.4.2 and 5.4.6. The dispersal of trips across the local and regional roadway network is presented in Sections 5.4.7 and 5.4.8. Air quality is discussed in Section 6.5.

NEC 02 **We note that East Boston residents already face an incredibly high environmental burden and pollution risks due to factors external to the proposed casino, including the following:**

- **The neighborhood's proximity to Logan Airport and related commercial traffic;**
- **Existing Route 1A and tunnel traffic;**
- **A plethora of fuel storage facilities;**
- **A proposed plan by Global Oil to transport ethanol, a highly dangerous and flammable substance, through the area by train; and**
- **Prior degradations in the environment caused by existing Suffolk Downs racetrack operations…**

The Project and surrounding Project area is discussed in the context of Environmental Justice in Section 1.10.

NEC 03 **[We request] a detailed impact assessment – including a health impact assessment – of the proposed casino complex on East Boston residents that includes: (a) estimated financial costs for East Boston residents, medical, and social service providers; and (b) strategies for addressing harms directly or indirectly related to the development.**

Section 1.10 details both socioeconomic and environmental justice issues as they pertain to the Project, and Section 6.0 describes potential environmental impacts including air quality and noise along with proposed mitigation.

NEC 04 **[We request] a detailed analysis of the cumulative environmental burden on East Boston that accounts for the existing private and commercial traffic, the proximity to Logan Airport, and the proximity of fuel storage facilities, in addition to the proposed impacts of the Suffolk Downs and Caesars casino complex.**

The transportation analysis provided in Section 5.0 accounts for background conditions, including existing Logan Airport, regional growth as approved by MassDOT, as well as planned projects as requested by the City of Revere and the City of Boston (see Section 5.3.2). In addition, the air and noise analyses provided in Section 6.0 also account for background conditions to realistically predict potential Project impacts in a cumulative fashion.

NEC 05 **[We request] a detailed analysis and plan to reduce vehicle traffic through East Boston that includes, but is not limited to, alternative means of transportation such as pedestrian access, bike, water, and public transportation.**

Alternative transportation modes are describes in Section 5.8, supported by a robust TDM plan described in Section 5.9.

NEC 06 **[We request] a comprehensive parking and traffic analysis that includes a review of the impact on residential parking access and use of local roads by taxis, shuttle services, and single occupancy vehicles.**

The parking analysis is presented in Section 5.10. The Proponent is committed to working with BTD and the City of Revere to protect neighborhood on-street parking for residents. Vehicle trip distribution and assignment to study area roadways are described in 5.4.7.

NEC 07 **[We request] a detailed impact analysis and strategies to address significant increases in light and noise pollution on abutters, including the Orient Heights residential neighborhood.**

The Proponent plans to minimize any potential impact from light pollution to abutters. The Proponent is committed to providing a site lighting design based on Dark Sky policies and strategies. Cutoff fixtures with energy efficient LED lighting will be considered along sensitive residential edges such as the Orient Heights neighborhood. Newly created open spaces between Tomasello Drive and Orient Heights will be landscaped to create a natural buffer zone to minimize light and noise pollution. As the site design further develops, the Proponent will provide a detailed impact analysis and outline further strategies to minimize the lighting and noise impacts from the development to the surrounding abutters. Regarding noise, sensitive receptors within the Orient Heights residential neighborhood have been included in the analysis and potential impacts are discussed in Section 6.6.4.

NEC 08 **[We request] a plan for monitoring and adequately addressing litter associated with advertisement campaigns, casino operations, and additional foot/vehicular traffic through local neighborhoods.**

Communities with casinos are just as safe as communities that do not have casinos. Independent research and data demonstrate that many jurisdictions hosting a single casino or a small number of casinos experience no increase in either crimes or crime rates following the introduction of casino gaming. In some cases, the numbers of crimes and crime rates actually decrease. Where the number of crimes has increased following the introduction of gaming, a scenario sometimes experienced where clusters of casinos have commenced operations or in very small host communities, the increase in the number of crimes is not due to gaming per se, but simply because of the additional population at risk in these communities. That is, when the increased population is properly accounted for, there is no increased risk of being a crime victim when comparing pre- and post-casino periods.

The available literature indicates proximity to a casino is associated with increased house prices and residential property values, rather than declines. A recent dissertation estimated that the magnitude of the housing price benefit of casino gambling is approximately two percent of household value for households living near a casino. We are not aware of any case study examining either at the neighborhood, city, or host county levels which provides evidence that housing property values or home prices declined due to the presence of a casino.

NEC 09 **[We request] a detailed description and analysis of alternatives in addition to the "Build" or "No Build" options...**

An alternatives analysis that includes reasonable development alternatives for the Project site is provided in Section 1.9.

NEC 10 **[We request] a detailed consideration of energy and water conservation and alternative energy measures and the use of sustainable building materials.**

Energy conservation is discussed in Section 9.5, and water conservation is addressed in Section 9.2.3. Alternative energy is discussed in the context of the GHG analysis in Section 7.0, and the use of sustainable building materials is addressed in Section 2.0.

NEC 11 **[We request] an evaluation of local and regional air quality impacts.**

The air quality analysis is provided in Section 6.5.

NEC 12 **[We request] analysis on soil and hazardous materials, stormwater management, sea level rise, and storm surge preparedness.**

Soil and hazardous materials are discussed in Section 6.10 and the Draft CMP in Attachment L. Stormwater management is addressed in detail in Section 9.3. Climate change adaptation and resiliency is discussed in the context of sea level rise and storm surge preparedness in Section 2.3.

NEC 13 **[We request] detailed recommendations for ongoing public reporting and community engagement over the proposed 100-year life of the Project.**

The Proponent has a steadfast commitment to integrity and communication with communities in which we live and work. The Caesars Code of Commitment can be found at http://www.caesars.com/corporate/about-us-code-of-commitment.html.

NEC 14 **We are concerned that the results of a full EIR – including detailed public information on the impacts, costs, and value of any proposed mitigation – may not be made available to the public prior to the release of a signed mitigation agreement between the developer and the City of Boston. Under the Massachusetts Gaming Law, the release of a signed agreement triggers a required vote in the host community within 60-90 days.**

In cooperation with the cities of Boston and Revere, the Proponent will comply with all relevant provisions of the Expanded Gaming Act related to the scheduling of the host community votes.

To: Buckley, Deirdre (EEA)
Subject: EEA No.15006

Dear,

Deirdre Buckley and To Whom it May Concern,

My concerns about such a large scale project like a possible Casino at Suffolk Downs would be the increased strain on an already over burdened community like East Boston. We have to deal with Jet Fuel Exhaust, Taxis cutting through our neighborhood instead of taking the tunnel, We have the rental car facility next door to us, we have cars going through both ways on the Ted Williams Tunnel, We have traffic and cars and exhaust from the Callahan and the Sumner Tunnels, We have heavy industry along the Chelsea Creek, Highway 1a running the entire length our East Boston, Fuel Tank Farm off of Chelsea St.,The airport/massport has public domained hundreds, thousands if you include the islands that made up East Boston, of acres or our land, … and now we get to have 10's of thousands of additional cars and people adding to our heavy burdens with added pollution and traffic??? How much more will we be subjected to? What is the limit of abuse we can take? How much Pollution is too much? When is enough/ enough? Is there not an environmental limit on how much one community can subjected to? **PUR 01**

Thank you for taking the time to read my concerns,

Sincerely,
Jesse Purvis
551 Sumner St.
East Boston, MA 02128

PURVIS, JESSE

PUR 01 **My concerns about such a large-scale project like a possible casino at Suffolk Downs would be the increased strain on an already overburdened community like East Boston… exhaust… heavy industry… traffic… How much pollution is too much?**

The Project and surrounding Project area is discussed in the context of Environmental Justice in Section 1.10.

Saugus River Watershed Council

26 March 2013

Secretary Richard Sullivan
Executive Office of Energy and Environmental Affairs
Attention: MEPA Office
100 Cambridge Street, Suite 900
Boston, MA 02114

Re: Caesars Resort at Suffolk Downs, Environmental Notification Form (EOEEA #15006)

Dear Secretary Sullivan:

The Saugus River Watershed Council is a non-profit organization founded in 1991 to protect and restore the natural resources of the Saugus River watershed. We have reviewed the Environmental Notification Form for Caesars Resort at Suffolk Downs and are pleased to submit the following comments for your consideration.

Background
The Saugus River Watershed Council has been working with local, state and regional public officials for many years to protect and restore the natural resources of the Rumney Marshes Area of Critical Environmental Concern (ACEC). We were active participants in the development of the Salt Marsh Restoration Plan for the Rumney Marshes ACEC. The Rumney Marshes ACEC encompasses over 2,200 acres of salt marsh at Rumney Marsh in Lynn, Saugus and Revere, as well as over 350 acres of salt marsh at Belle Isle Marsh in Revere, Winthrop and Boston. The Saugus River empties into Rumney Marsh which is one of the most important natural areas in our watershed, providing critical flood storage protection as well as valuable habitat for birds, fish and other wildlife.

While the footprint of the proposed Caesars Resort falls outside of the boundaries of the Saugus River watershed, we are submitting comments on the ENF because a project of this scale and magnitude will have an impact on the region.

The Saugus River Watershed Council was selected to receive $90,000 from Suffolk over four years to reestablish a water quality monitoring program for the Saugus River watershed. Suffolk's provision of funding toward this project was undertaken in connection with the settlement of an enforcement action, *United States v. Sterling Suffolk Racecourse, LLC*, on behalf of the U.S. Environmental Protection Agency under the Clean Water Act. The results of our new water quality sampling program will be used to track and improve water quality conditions in the Saugus River and the Rumney Marshes ACEC.

Project Scope
Caesars Resort at Suffolk Downs proposes redeveloping 161 acres in Boston and Revere to create a major gaming facility with two hotels, 200,000 square feet of gaming space, retail establishments, restaurants, parking and associated support infrastructure. When complete, the site will include 1.8 million square feet of new development and generate approximately 24,600 vehicle trips per day. As noted in the ENF, this project requires preparation of a full Environmental Impact Report because it

alters more than 50 acres of land, and generates more than 3,000 vehicle trips per day. The proposed project will also have an impact on the Belle Isle Marsh portion of the Rumney Marshes Area of Critical Environmental Concern.

Sustainable Building and Landscape Design

The ENF indicates a very high level of commitment by the development team to ensure that buildings, landscape, and site design incorporate environmentally sustainable strategies. We are pleased, that the developer is committed to achieving a minimum Gold standard of Leadership in Energy and Environmental Design (LEED) in the following categories:

- Sustainable sites credits encourage strategies that minimize the impact on ecosystems and water resources.
- Water efficiency credits promote smarter use of water, inside and out, to reduce potable water consumption.
- Energy & atmosphere credits promote better building energy performance through innovative strategies.
- Materials & resources credits encourage using sustainable building materials and reducing waste.
- Indoor environmental quality credits promote better indoor air quality and access to daylight and views.

The ENF also indicates that stormwater management techniques will reduce stormwater impacts to resource areas. The ENF should fully document all of the stormwater and low impact design techniques planned to ensure that there is no negative impact on the Rumney Marshes Area of Critical Environmental Concern. **SRWC 01**

Climate Change Adaptation and Mitigation

With funding from the Massachusetts Environmental Trust, the Saugus River Watershed Council is working in partnership with Geosyntec Consultants to promote climate adaptation and mitigation plans on a site-specific and community-wide basis. We are pleased to see that the ENF includes consideration of risks associated with sea level rise and other anticipated impacts of climate change. As a large-scale new development in the region, Caesars Resort presents an opportunity to incorporate climate adaptation strategies in the initial design of building, stormwater and landscape features. As part of the mitigation package for this project, we encourage the developer to consider funding site-specific climate adaptation and coastal resiliency strategies for adjacent properties and / or broader efforts focused on community or region-wide strategies. In addition to planning for climate change, we encourage the development team to incorporate educational opportunities at the site that so that climate change mitigation and adaptation strategies (and LEED features) at Caesars Resort can serve as a model for other developments in the region. **SRWC 02**

Potential Impact on Water Resources

The Environmental Impact Report should fully document all wetlands and associated impacts of the project both on site and for any proposed mitigation areas. The Saugus River Watershed Council supports the City of Revere's determination that floodplain areas on the site are classified as Bordering Land Subject to Flooding and that compensatory flood storage is required for any fill. Ensuring compensatory flood storage will also support the project proponent's goals of ensuring that the site is 'climate ready' to withstand rainstorms with increasing intensity. **SRWC 03**

We support the project proponent's proposal to decrease impervious areas by nine acres as part of their overall stormwater management plan. The proposed vegetated filters are an important strategy for improving water quality, reducing runoff and management flow onsite. We encourage the developer to work with the MA Department of Transportation to incorporate similar environmentally sustainable design features into all offsite roadway improvement projects. **SRWC 04**

Transportation

Development of this project will have a significant impact on roadways throughout the region, many of which travel through the Saugus River watershed. Portions of Route 1, Route 1A and Route 60 in Revere and Saugus drain directly to the Rumney Marshes Area of Critical Environmental Concern within the Saugus River watershed. Offsite roadway improvement projects identified in the Environmental Impact Report should document impacts to adjacent wetlands, and incorporate improvements to stormwater management and drainage. Several mitigation opportunities for stormwater and drainage improvements associated with Route 1 and Route 60 have previously been identified by state and environmental agencies. **SRWC 05**

Long-term Support for Environmental Sustainability

We encourage the developers of this project to commit to long-term support for environmental restoration and protection as well as education projects throughout the region. Both on site and off site opportunities for salt marsh restoration, environmental education programs, water quality improvements, and public access should be fully documented in the Environmental Impact Report. In additional to the specific mitigation strategies suggested in this letter, several opportunities for salt marsh restoration are documented in the Salt Marsh Restoration Plan for the Rumney Marshes ACEC. **SRWC 06**

Please feel free to contact me at srw@shore.net or 781-233-5046 if you have any questions regarding the Saugus River Watershed Council or our comments regarding this project. Thank you in advance for your consideration.

Sincerely,

Joan LeBlanc
Executive Director

Cc: Andrew DeSantis, Revere Conservation Commission

SAUGUS RIVER WATERSHED COUNCIL

SRWC 01 **The [EIR] should fully document all of the stormwater and LID techniques planned to ensure that there is no negative impact on the Rumney marshes ACEC.**

The Project will meet and exceed MassDEP Stormwater Management Guidelines regarding water quality treatment in critical areas (see Section 9.3). The Project will utilize LID BMPs including bioretention basins, bioswales, water quality swales, pervious pavers, and rainwater reuse tanks to improve the water quality of stormwater discharges to the Belle Isle Inlet and Rumney Marshes ACEC (see Section 9.3.

SRWC 02 **We encourage the developer to consider funding site-specific climate adaptation and coastal resiliency strategies for adjacent properties and/or broader efforts focused on community or region-wide strategies… We encourage the development team to incorporate educational opportunities at the site so that climate change mitigation and adaptation strategies (and LEED features) at Caesars Resort can serve as a model for other developments in the region.**

The Proponent intends to provide educational displays throughout the property that will show the results of energy savings and other sustainable measures. The Proponent can also include information placards at certain points along the public walkway to discuss LEED strategies that pertain to that specific area. For example, near the wetlands a display may discuss stormwater management and plant filtering.

SRWC 03 **The Draft EIR should fully document all wetlands and associated impacts of the Project both on site and for any proposed mitigation areas.**

Information describing the delineated wetland resource areas is provided in Section 6.9. A more detailed discussion describing on-site wetlands can be found in Attachment I. Information demonstrating compliance with applicable WPA performance standards is provided in Section 6.9.

SRWC 04 **We support the Project Proponent's proposal to decrease impervious areas… We encourage the developer to work with MassDOT to incorporate similar environmentally sustainable design features into all offsite roadway improvement projects.**

Commitments to sustainable design principles for off-site improvements are described in Section 5.5.8.

SRWC 05 **Offsite roadway improvement projects identified in the EIR should document impacts to adjacent wetlands and incorporate improvements to stormwater management and drainage.**

Potential impacts to off-site wetlands are described in Section 6.9.2.

SRWC 06 **We encourage the developers of this Project to commit to long-term support for environmental restoration and protection as well as education projects throughout the region. Both on-site and off-site opportunities for salt marsh restoration, environmental education programs, water quality improvements, and public access should be fully documented in the EIR.**

Section 4.4 describes ecological restoration on-site, and Section 1.4 describes public access opportunities. As demonstrated herein, Caesars and Suffolk Downs maintain a deep commitment to sustainability; however, they are still evaluating which educational programs they will support.

26 March 2013

Secretary Richard K. Sullivan, Jr.
Executive Office of Energy and Environmental Affairs

Boston, MA 02114
ATT: MEPA Office

RE: EOEA No.15006- Environmental Notification Form
Caesars Resort at Suffolk Downs, East Boston and Revere

Dear Secretary Sullivan:

The Boston Harbor Association, a non-profit, public interest organization founded in 1973 to promote a clean, alive, and accessible Boston Harbor, is in receipt of the Environmental Notification Form for the proposed Caesars Resort at Suffolk Downs. The project proponent, Sterling Suffolk Racecourse, LLC, has filed an application with the Massachusetts Gaming Commission for a license to operate a gaming facility on their 161-acre property in East Boston and Revere. Besides enhancements to the existing Suffolk Downs horse racing facility, the proponent proposes two distinct gaming areas, two hotels with 450 rooms, multi-purpose meeting/entertainment space, parking, and retail/ restaurant uses.

The project proponent and its team briefed The Boston Harbor Association on the proposed project at TBHA's 18 December 2012 Harbor Use Committee meeting. Based on that meeting and review of the Environmental Notification Form (ENF), we ask that the following be incorporated into the Secretary's Certificate for the scope of the Draft Environmental Impact Report (DEIR):

Transportation: Section 3 of the ENF outlines four scenarios to be analyzed in the Draft EIR: existing condition; 2020 no-build; 2020 future conditions with the project; and 2020 build with mitigation. The ENF acknowledges significant traffic congestion on a number of existing roads, and states that project benefits may include new ramp connections and roadways to be funded by the proponent. Parking will be reduced from the existing 6,000 spaces to 5,150 spaces, which we strongly support. Consistent with the decreased amount of parking, we urge the proponent to help subsidize transit usage by employees; to provide shuttle service to transit stations; to limit employee parking to only those employees who require ADA access; and to provide employee parking only during work shifts when MBTA service is not available. Improved pedestrian connections from the MBTA Suffolk Downs station to the project site by the proponent will help make transit usage more attractive for residents, workers, and visitors. **TBHA 01**

The ENF examined water transportation opportunities (pages 2-9 to 2-13 of ENF), with mixed results. While the proponent will continue to explore water transportation options, "...analysis has concluded that water transportation dedicated to the Project is not practical" (page 2-10 of ENF). We concur that docking along Chelsea Creek is not feasible, given navigational constraints and the conflicting uses in the designated port area (DPA). While the Boston Inner Harbor routes to Logan Airport and to Boston Harbor Shipyard & Marina require physically longer landside connections, visitors to the casino resort destination will no doubt consider the boat trip part of the destination experience. We ask that the Secretary's Certificate for the DEIR require further analysis of the water transportation options, including coordination with the Massachusetts Port Authority which owns the aforementioned docks, with the Boston Redevelopment Authority which will be initiating boat service between the South Boston Innovation District and East Boston, and with private boat operators who may initiate service from the South Shore and other locations for visitors going to the site. **TBHA 02**

The project proponent proposes to expand the existing bicycle network from Saratoga Street along Bennington Street to Eliot Circle at Revere Beach, creating what the project proponent calls a "beach-to-beach connection between Constitution Beach to the south and Revere Beach to the north" (page 3-20 of ENF). We are highly supportive of this connection, and look forward to greater detail in the Draft EIR. **TBHA 03**

Pedestrian Access: Due to the close proximity of the project site to residential neighborhoods, many local residents walk to and from the site. The ENF notes that currently, Orient Heights residents access nearby retail stores by going through the Suffolk Downs property (page 3-20 of ENF). While the two proposed hotels have relatively low building heights (135 feet and 166 feet), it is not clear whether there may be micro-climate impacts upon pedestrians' and cyclists' use and enjoyment of the site. As part of the Draft Environmental Impact Report, we ask that an analysis of potential wind and shadow impacts to the pedestrian and cyclist experiences be included, with particular attention to minimizing any adverse impacts upon local pedestrians. **TBHA 04**

Open Spaces: The project proponent proposes to transform approximately 9 acres of existing impervious paving in the parking lots to landscaping, which will make these areas more attractive and help create a more resilient landscape. The Boston Harbor Association highly commends the proponent for this environmentally sustainable and climate change adaptation measure.

As part of a consent decree between the U.S. Environmental Protection Agency and Sterling Suffolk Racecourse, the Racecourse was required to make improvements to its stormwater system, cease unauthorized discharges from its concentrated animal feeding operation, and apply a portion of the proposed penalty to supplemental environmental projects. One of the supplemental environmental projects is the construction of a boardwalk and related signage at Belle Isle Marsh Reservation, the last remaining salt marsh within Boston.

As the project proponent continues to identify community benefit projects during the various permitting and review processes, we ask that consideration be given to the following:

---Salt marsh restoration in the Rumney Marshes Area of Critical Environmental Concern (ACEC), which includes Belle Isle Marsh and Rumney Marsh. Besides proposed improvements to the quality of the stormwater being discharged, the proponent should also help support projects identified within the Rumney Marshes ACEC Salt Marsh Restoration Plan to restore degraded salt marsh in the ACEC. **TBHA 05**

---East Boston Greenway. As noted in the Environmental Notification Form, the City of Boston and the Massachusetts Port Authority are working together and with others to complete the East Boston Greenway between Constitution Beach and Belle Isle Marsh. We ask that the proponent also help support the completion of this important link along the water's edge for the enjoyment of local residents and the general public. **TBHA 06**

Climate change mitigation and adaptation: Caesars Entertainment is to be commended for its strong commitment to environmental sustainability, and for setting a "green" standard within the gaming industry. This commitment is reflected in the ENF, with significant attention to low impact development and best management practices. Besides striving for LEED Gold, the proponent is also examining possible usage of renewable energy.

As part of a further analysis of climate change preparedness, "the Proponent will consider in the DEIR potential impacts or changes resulting from a storm surge, increased frequency of storms, rising temperatures, increased frequency of extreme hot days, precipitation changes, as appropriate" (page 4-15 of ENF). We look forward to seeing this detailed analysis. **TBHA 07**

As part of the December, 2012 TBHA Harbor Use Committee discussion, there was significant support for the proponent's conversion of existing impervious paving to pervious landscaping. Incorporation of such a climate change adaptation measure will no doubt help increasing the project's resilience. It was further **TBHA 08**

suggested that the proponent might want to host a design charrette to receive additional "soft engineering" suggestions, which we hope the proponent will convene.

Thank you for your consideration.

Sincerely,

Vivien Li
President
The Boston Harbor Association

THE BOSTON HARBOR ASSOCIATION

TBHA 01 **Consistent with the decreased amount of parking, we urge the Proponent to help subsidize transit usage by employees, to provide shuttle service to transit stations, to limit employee parking to only those employees who require ADA access, and to provide employee parking only during work shifts when MBTA service is not available.**

The TDM plan in Section 5.9 includes commitments to subsidize employee transit use and enhance the shuttle service to Suffolk Downs Station. The employee parking plan described in Section 5.10.3 will cater to employees when MBTA service is not available.

TBHA 02 **While the Boston Inner Harbor [water transportation routes] to Logan Airport and to Boston Harbor Shipyard & Marina require physically longer landside connections, visitors to the casino resort destination will no doubt consider the boat trip part of the destination experience. We ask that the Secretary's Certificate for the DEIR require further analysis of the water transportation options, including coordination with the Massachusetts Port Authority which owns the aforementioned docks, with the Boston Redevelopment Authority (BRA) which will be initiating boat service between the South Boston Innovation District and East Boston, and with private boat operators who may initiate service from the South Shore and other locations for visitors going to the site.**

The Proponent supports Mayor Menino's vision to enhance water transportation options to East Boston by instituting regular water shuttle service between the South Boston and East Boston waterfronts. As such, the Boston HCA includes a contribution that will assist the City in establishing this service.

TBHA 03 **We look forward to greater detail [on the expansion of the existing bicycle network from Saratoga Street along Bennington Street to Eliot Circle at revere Beach].**

The concept for the on-street bicycle accommodations is described in Section 5.6.3.

TBHA 04 **As part of the Draft EIR, we ask that an analysis of potential wind and shadow impacts to the pedestrian and cyclist experiences be included, with particular attention to minimizing any adverse impacts upon local pedestrians.**

An analysis of potential wind impacts is provided in Section 6.1, and a shadow analysis is provided in Section 6.2.

TBHA 05 **[We ask that the Proponent consider] salt marsh restoration in the Rumney Marshes ACEC, which includes Belle Isle Marsh and Rumney Marsh. Besides proposed improvements to the quality of the stormwater being discharged, the Proponent should also help support projects identified within the Rumney Marshes ACEC Salt Marsh Restoration Plan to restore degraded salt marsh in the ACEC.**

The proposed stormwater management at the Project site will result in significant water quality improvements in the downstream ACEC. Stormwater management and associated water quality benefits are described in Section 9.3.

TBHA 06 **As noted in the ENF, the City of Boston and the Massachusetts Port Authority are working together and with others to complete the East Boston Greenway between Constitution Beach and Belle Isle Marsh. We ask that the Proponent also help support the completion of this important link along the water's edge for the enjoyment of local residents and the general public.**

Section 4.1 describes the Project's proximity to East Boston's network of open spaces.

TBHA 07 **We look forward to seeing a detailed analysis [of potential impacts or changes resulting from storm surge, increased frequency of storms, rising temperatures, increased frequency of hot days, and precipitation changes].**

The Resort has been designed to accommodate sea level rise (see Section 2.3). The 100-year floodplain on the site is at elevation 15.46 feet (BCB), and MHHW on the Project site is at elevation 10.44 feet. Consistent with The Boston Harbor Association's sea level rise analysis, the Project team applied a sea level rise of 7.5 feet to MHHW to obtain a sea level rise "mitigation elevation" of 18.7 feet, and has located the proposed buildings, entrance road, and critical infrastructure above this elevation to provide resiliency to sea level rise.

The major building infrastructure is designed with a modular approach so that if necessary, additional infrastructure can be added in the future to respond to climate change. For example, if temperatures increase, additional cooling capacity could be added via a new chiller and cooling tower. If severe storms become more frequent, emergency generators can be added to back-up more of the facility's functions.

TBHA 08 As part of the December 2012 TBHA Harbor Use Committee discussion, there was significant support for the Proponent's conversion of existing impervious paving to pervious landscaping... It was further suggested that the Proponent might want to host a design charrette to receive additional "soft engineering" suggestions, which we hope the Proponent will convene.

Section 4.4 describes how impervious paving will be replaced with a stormwater treatment landscape employing native plantings.

March 26, 2013

Secretary Richard K. Sullivan, Jr.
Executive Office of Energy and Environmental Affairs (EEA)
100 Cambridge Street, Suite 900
Boston MA 02114

RE: **Comments on ENF for Caesars Resort at Suffolk Downs - EEA #15006**

Dear Secretary Sullivan:

WalkBoston has reviewed the ENF for Caesars Resort at Suffolk Downs. We find agreement with the general design, as it seems directed toward providing safe facilities for pedestrians. A number of design details should be more closely investigated as part of the DEIR. Our comments about those details follow.

Underlying Assumptions

Many of the patrons and staff of the casino complex and racetrack will arrive on foot from transit stations or parking lots. Thus walking should be a significant element of the project design, coordinated with vehicular routes to minimize potential conflicts. Walking, transit and bike use should be maximize d in keeping with the Commonwealth's goal of tripling the share of walking, biking and transit use. Access to and from the two MBTA stations and the Route 1A bus lines, and access between distant parking locations and the casinos and the racetrack are the primary routes to be addressed. Walking access between the site and adjacent residential areas should also be addressed. **WB 01**

Good information about the projected volumes of pedestrians (and bicycles) should inform the design and size of facilities.

For example, the ENF states that most employees will come to the site via public transportation. While not explicitly stated, we would anticipate that nearly all would walk from the MBTA stations into the site (unless shuttle service is provided). Because the Suffolk Downs Station is considerably closer to the proposed buildings than Beachmont Station, it will likely attract more users. The walkway from the station into the site should be designed to accommodate the anticipated volume of walkers (and bicyclists if they will use the same route) and the projected volumes should be included in the DEIR. **WB 02**

Overall Design Issues to be addressed

- <u>The design of walkways and walk routes should be attractive, include high quality landscaping, and feel inviting both day and night, winter and summer. Designs should include:</u> **WB 03**
  - A network of short distance walkways to encourage people to walk on site.
  - Lighting for safety, using designs that do not spill into residential areas or obscure the night sky
  - Safety and security especially given late night operations for employees and patrons, where there are fairly long walks such as the one to the Suffolk Downs MBTA station
  - Benches
  - Smooth surfaces on all walkways
  - Year round maintenance including snow shoveling
  - Shade while walking to the casinos and hotels

MAKING MASSACHUSETTS MORE WALKABLE
Old City Hall | 45 School Street | Boston MA 02108 | T: 617.367.9255 | F: 617.367.9285 | info@walkboston.org | www.walkboston.org

- In New England, inclement weather is inevitable, suggesting the possibility of providing shelters or coverings along walkways, or alternative means of reaching destinations, such as a shuttle bus service **WB 04**
- Wayfinding for pedestrians – Signage should be employed as fully as possible to help pedestrians find their routes within this very large site. Signs would also encourage the use of MBTA bus routes and subway facilities, and should be used to designate access points in the event an on-site bus shuttle service is provided. Other off-site locations of interest should be included, such as the Belle Isle Marsh Reservation, Revere Beach and potentially the Target/Super Stop and Shop complex , the racetrack's horse barns and other sites that might improve the experience of nearby residents as well as patrons of the casinos, the racetrack, and the hotels. **WB 05**
- Parking lots should be designed attractively, with trees and with defined walking paths that are separated from moving vehicle areas within the lots **WB 06**

- Multi-use path design.
  The paths on the site that are walking/biking multi-use paths should provide appropriate widths to allow for safe shared use. MassDOT standards (Mass Highway Department Project Development and Design Guide, 2006), call for multi-use paths to be 10—14 feet wide to accommodate both pedestrians and bicycles, and for wider facilities if substantial volumes of foot and bike traffic are anticipated. **WB 07**

Tomasello Way/Rte 1A intersection and Tomasello Way Design

- Bus service
  Bus service along Rte 1A is already substantial. Routes along the roadway connect Salem Center, Marblehead and Peabody Square to Haymarket and Downtown Crossing – 6 bus routes in total. Well-designed and highly-visible bus stops, along with weather-protecting shelters, should be included in the revamping of the intersection of the Tomasello Way/Rte 1A intersection. **WB 08**
- Signals and crosswalks
  In keeping with the intersection's importance as the front door of the proposed development, the intersection will need to be fully signalized for safety for all users, including pedestrians who will be crossing Rte 1A to and from the new bus stops and shelters. In the re-signalization of the intersection, pedestrian count-down signals should be employed. **WB 09**
- Access between the intersection and the on-site facilities
  The proposal includes a major pedestrian way leading from the intersection of Tomasello Way and Rte 1A into the main entrance to the casinos, the racetrack and the hotels. It appears to be useful and attractive, but it must be made safe for walkers and is worthy of significant improvements to make it safe. According to the preliminary drawings, the walkway will be located in the median strip of the rebuilt south portion of Tomasello Way. This is a formal design that could be handsome, but it results in a strip of walkway in the median that could be difficult for walkers to access, because it requires them to cross roadways on both ends of the walkway – near Rte 1A and at the casino/racetrack entrances, as well as at intermediate locations in between – five crosswalks in all. A better solution might be to have the pedestrian way located on the south side of Tomasello Way, with more direct access across the street at a point where the walkway is closest to the casino. This would reduce potential pedestrian/vehicle conflicts along the full length of this stretch of Tomasello Way. **WB 10**
- Amenities along Tomasello Way

Pedestrians walking via Tomasello Way have a relatively long walk between Rte 1A and the site (roughly equivalent to 3-4 city blocks). The preliminary drawings show lines of trees that will be very appropriate to make a pleasant walk. Seating along the way would also make the route more attractive and allow people to rest as they make their way to the casinos or the racetrack. **WB 11**

- A sidewalk connecting Tomasello Way and Waldemar Avenue in Orient Heights
  A wholly new but short on-site sidewalk connecting Tomasello Way and Waldemar Avenue would allow Orients Heights residents to reach the bus stops at the intersection of Rte 1A and Tomasello Way, and to be able to walk to the casinos or the racetrack. **WB 12**
- A roadway connecting Tomasello Way to Waldemar Avenue in Orient Heights
  Consideration of a sidewalk connecting Tomasello Way and Waldemar Avenue should include examination of a future road connection as well. A new, relatively short street to link Tomasello Way to Waldemar Avenue could reduce problems at the intersection of Waldemar Avenue and Route 1A near the Tomasello Way entrance to the site because it would allow Orient Heights access to be diverted to the Tomasello Way entrance to the site. The connection could include options for improving the safety of nearby residents:
  - Waldemar Avenue could become a dead-end street before reaching Rte 1A; or
  - It could be made one-way inbound toward the residences; or
  - It might be connected to Vallar Road if gradients are favorable.

The continuation of Tomasello Way to the Suffolk Downs MBTA station

A driveway currently exists along the proponent's property line between the Rte 1A entrance to the site and the small turnaround space in front of Suffolk Downs T station. The west half of this route has been covered above. However, the future of the east half of the driveway is unclear, even though it could be used for vehicular and pedestrian traffic as part of the larger plan. An explanation should be provided as to: **WB 13**

- Whether this driveway will become an access roadway providing service both to the south entrance to the casino, and to the Suffolk Downs MBTA Station.
- Whether this driveway will be extended to connect into the local roadways of Orient Heights, such as Waldemar Avenue, Walley Street and Bonito Square. This connection could relatively easily reach Bennington Street as well, and could become a major route for vehicles entering or leaving the site.
- Whether an improvement is planned for the pedestrian component of the service plaza at the MBTA Station.
- What the pedestrian connections along this roadway will become, as it provides a major walkway between the MBTA station and the casinos and hotels. This connection might also be used to enhance direct access from neighborhood walkways into the station.

Pedestrian access from off-site locations

- Pedestrian access between Orient Heights and a potential Route 1A bus stop at Boardman Avenue.
  A partial interchange is proposed for the intersection of Boardman Avenue (Route 145) and Route 1A. The proposal calls for a northbound overpass above Rte 1A to pass over the turning between Rte 1A and Boardman Avenue. The overpass design and focus of turning traffic at the intersection suggests some difficult crossings for pedestrians from Orient Heights. Bus stop access for pedestrians should be explored as part of the proposed partial interchange. It may be possible to link Boardman Street access to the bus stop at Tomasello Way. **WB 14**
- Pedestrian access between Orient Heights and the Target/Super Stop and Shop complex
  The ENF notes that walkers from Orient Heights need to cross the Suffolk Downs site to get to **WB 15**

the shopping complex located near the intersection of Tomasello Way and Furlong Drive, which are important businesses for Orient Heights residents to use. Data support-ing this suggestion would be useful. The multi-use path along Tomasello Way will improve this walk. From a pedestrian point-of-view, the suggested location of the walkway on the east side of Tomasello Way results in pedestrians from Orient Heights crossing at least 6 streets on route to the shopping complex, unless they follow the alternative walking route that hugs the buildings. The proponent should examine whether the walkway could be moved to the west side of Tomasello Way to reduce the number of crossings. Pedestrians walking along Tomasello Way should also be protected from walking through either of the two roundabouts at the approach to the hotels and casinos. Roundabouts are not very safe for pedestrian because of the potential conflicts with turning vehicles.

- Pedestrian access between Crescent Heights and the Target/Super Stop and Shop complex
  Residents of the Crescent Heights neighborhood at the north edge of the site could also reach the shopping area via the Tomasello Way walkway.
- Racetrack walkway to the Target/Super Stop and Shop complex
  The plan includes a walkway between the racetrack and the Target/Super Stop and Shop via the edge of the northern parking lots. The intersection of this walkway and Tomasello Way should be moved slightly to align with the front entrance to the shopping complex. The volume of foot traffic at this intersection may be low, but further exploration may suggest the need for a traffic signal with WALK signals. **WB 16**

Potential shuttle bus service

Shuttle buses should be considered to help people get around and to provide options during inclement weather. Options for shuttle bus stops include main entrances to the casino and race track, the Suffolk Downs and Beachmont MBTA stations, bus stops on Route 1A at Tomasello Way, the bus stop on Winthrop Avenue, and for access to the more remote parking areas. Facilities to support shuttle bus service may include the addition of a turnaround area in front of Suffolk Downs MBTA Station and a u-turn on Tomasello Way just short of Route 1A. Shuttles may also be useful to serve future night transit service on the Blue Line and elsewhere. **WB 17**

Local Community Benefits - pedestrian improvements at other locations

The ENF includes suggestions that certain improvements outlined by the Lower North Shore Traffic Study of 2000 could be included as part of the mitigation for the construction of this facility. Although no detail has been supplied on these locations, they appear to include intersections at Route 16 at Winthrop Avenue/Harris Street, the vicinity of the Beachmont MBTA Station in Revere, in the vicinity of Route 16/Route 1A/Bell Circle in Revere, and, in East Boston, at Bennington & Saratoga Streets at Orient Heights MBTA station and Boardman St. in East Boston. Many of these improvements have been requested by the affected communities and will need to be detailed in further submittals to show potential impacts on pedestrians. **WB 18**

We appreciate your consideration of our comments and your responses to them. Please feel free to contact WalkBoston with any questions you may have.

Sincerely,

Wendy Landman

Wendy Landman
Executive Director

WALK BOSTON

WB 01 Walking, transit and bike use should be maximized in keeping with the Commonwealth's goal of tripling the share of walking, biking, and transit use. Access to and from the two MBTA stations and the Route 1A bus lines, and access between distant parking locations and the casino and the racetrack are the primary routes to be addressed. Walking access between the site and adjacent residential areas should also be addressed.

Sections 1.4 and 4.4 describe pedestrian and bicycle connectivity from surrounding neighborhoods to the Project site.

WB 02 The walkway from [Suffolk Downs] station into the site should be designed to accommodate the anticipated volume of walkers (and bicyclists if they will use the same route) and the projected volumes should be included in the DEIR.

Sections 1.4 and 4.4 describe pedestrian and bicycle connectivity from surrounding neighborhoods to the Project site.

WB 03 The design of walkways and walk routes should be attractive, include high quality landscaping, and feel inviting both day and night, winter and summer. Designs should include:

- A network of short distance walkways to encourage people to walk on site;
- Lighting for safety, using designs that do not spill into residential areas or obscure the night sky;
- Safety and security, especially given late-night operations for employees and patrons, where there are fairly long walks such as the one to Suffolk Downs MBTA station;
- Benches;
- Smooth surfaces on all walkways;
- Year-round maintenance including snow shoveling; and
- Shade while walking to the casino and hotels.

Sections 1.4 and 4.4 describe pedestrian and bicycle connections from surrounding communities to the Project site as well as amenities for pedestrians and bicyclists.

WB 04 In New England, inclement weather is inevitable, suggesting the possibility of providing shelters or coverings along walkways, or alternative means of reaching destinations, such as a shuttle bus service.

Sections 1.4 and 4.4 describe pedestrian and bicycle connections to the Project from surrounding neighborhoods. Walkways and paths will be shaded whenever possible.

WB 05 **Signage should be employed as fully as possible to help pedestrians find their routes within this very large site. Signs should also encourage the use of MBTA bus routes and subway facilities... Other off-site locations of interest should be included, such as the Belle Isle Marsh Reservation, Revere Beach, and potentially the Target/Super Stop and Shop complex, the racetrack's horse barns and other sites...**

The Proponent has engaged a signage consultant to develop a comprehensive way-finding system for both the interior building and exterior site signage. The preliminary framework of signage will include: identification, direction, information, regulation and amenities. This framework of signs will incorporate all the comments listed above.

WB 06 **Parking lots should be designed attractively, with trees and with defined walking paths that are separated from moving vehicle areas within the lots.**

Section 4.4.9 describes how the parking lots are designed to be both functional and attractive.

WB 07 **The paths on the site that are walking/biking multi-use paths should provide appropriate widths to allow for safe shared use.**

Sections 1.4 and 4.4 describe pedestrian and bicycle connections to the Project from surrounding neighborhoods.

WB 08 **Well-designed and highly-visible bus stops, along with weather-protecting shelters, should be included in the revamping of the intersection of the Tomasello Way/Route 1A intersection.**

The enhancement of bus stops on Route 1A will be investigated as part of the design development of the option concepts presented in Section 5.5.

WB 09 **In keeping with the [Tomasello Way/Route 1A] intersection's importance as the front door of the proposed development, the intersection will need to be fully signalized for safety for all users, including pedestrians who will be crossing Route 1A to and from the new bus stops and shelters. In the re-signalization of the intersection, pedestrian countdown signals should be employed.**

Pedestrian accommodations at this intersection will be refined as part of the design development of the option concepts presented in Section 5.5.

WB 10 The proposal includes a major pedestrian way leading from the intersection of Tomasello Way and Route 1A into the main entrance to the casino, racetrack, and hotels. It appears to be useful and attractive, but it must be made safe for walkers and is worthy of significant improvements... According to the preliminary drawings, the walkway will be located in the median strip of the rebuilt south portion of Tomasello Way. This is a formal design that could be handsome, but it results in a strip of walkway in the median that could be difficult for walkers to access because it requires them to cross roadways on both ends of the walkway – near Route 1A and at the casino/racetrack entrances, as well as at intermediate locations in between – five crosswalks in all. A better solution might be to have the pedestrian way located on the south side of Tomasello Way, with more direct access across the street at a point where the walkway is closest to the casino.

Since the ENF filing, the pathway has been reconfigured to keep it separate from the roadway, moving it through the ecological landscape to provide a more enjoyable pedestrian experience.

WB 11 Pedestrians walking via Tomasello Way have a relatively long walk between Route 1A and the site (roughly equivalent to 3-4 city blocks). The preliminary drawings show lines of trees that will be very appropriate to make a pleasant walk. Seating along the way would also make the route more attractive and allow people to rest...

Sections 1.4 and 4.4 describe the pedestrian connections to the Project, which will be shaded whenever possible and will include site furnishings and amenities.

WB 12 A wholly new but short on-site sidewalk connecting Tomasello Way and Waldemar Avenue would allow Orient Heights residents to reach the bus stops at the intersection of Route 1A and Tomasello Way, and to be able to walk to the casino or racetrack... Consideration of a sidewalk connecting Tomasello Way and Waldemar Avenue should include examination of a future road connection as well.

Sections 1.4 and 4.4 describe a pedestrian connection from Orient Heights to the Project. Through the extensive public outreach that has accompanied the Project, the Proponent has learned that a future vehicular road connection is not favored by the community due to the potential to attract Project trips through the neighborhood.

WB 13 A driveway currently exists along the Proponent's property line between the Route 1A entrance to the site and the small turnaround space in front of Suffolk Downs T station... The future of the east half of the driveway is unclear... An explanation should be provided as to:

- Whether this driveway will become an access roadway providing service both to the south entrance to the casino and to the Suffolk Downs MBTA station;

- Whether this driveway will be extended to connect into the local roadways of Orient Heights...;
- Whether an improvement is planned for the pedestrian component of the service plaza at the MBTA station; and
- What the pedestrian connections along this roadway will become, as it provides a major walkway between the MBTA station and the casino and hotels.

Pedestrian and bicycle connections are described in Sections 1.4 and 4.4.

WB 14 A partial interchange is proposed for the intersection of Boardman Street (Route 145) and Route 1A. The proposal calls for a northbound overpass above Route 1A to pass over the turning between Route 1A and Boardman Street. The overpass design and focus of turning traffic at the intersection suggests some difficult crossings for pedestrians from Orient Heights. Bus stop access for pedestrians should be explored as part of the proposed partial interchange. It may be possible to link Boardman Street access to the bus stop at Tomasello Way.

The concept plan for the flyover solution (Option 4) includes such a pedestrian connection.

WB 15 The ENF notes that walkers from Orient Heights need to cross the Suffolk Downs site to get to the shopping complex located near the intersection of Tomasello Way and Furlong Drive... Data supporting this suggestion would be useful. The multi-use path along Tomasello Way will improve this walk... The Proponent should examine whether the walkway could be moved to the west side of Tomasello Way to reduce the number of [pedestrian] crossings. Pedestrians walking along Tomasello Way should also be protected from walking through either of the two roundabouts at the approach to the hotels and casino.

Sections 1.4 and 4.4 describe pedestrian and bicycle connections as well as the streetscape design along Tomasello Drive. The proposed site layout will require that pedestrian cross the traffic circle areas. Proposed walkways have been designed to maintain all pedestrian traffic on the east side of Tomasello Drive closest to Project activities. All pedestrian crossings of proposed roadways and traffic circles will be designed to maximize pedestrian safety, including the incorporation of crosswalks and ramps.

WB 16 The plan includes a walkway between the racetrack and the Target/Super Stop and Shop via the edge of the northern parking lots. The intersection of this walkway and Tomasello Way should be moved slightly to align with the front entrance to the shopping complex.

Pedestrian and bicycle connections are described in Sections 1.4 and 4.4; pathways along Tomasello Drive have been carefully designed to consider access to the adjacent shopping center.

WB 17 **Shuttle buses should be considered to help people get around and to provide options during inclement weather.**

On-site shuttle service to the MBTA Suffolk Downs Station will be enhanced. An off-site shuttle plan is presented in Section 5.8.3.

WB 18 **The ENF includes suggestions that certain improvements outlined by the Lower North Shore Traffic Study of 2000 could be included as part of the mitigation for the construction of this facility... Many of these improvements have been requested by the affected communities and will need to be detailed in further submittals to show potential impacts on pedestrians.**

Concept plans for many off-site improvements include improved pedestrian accommodations and safety. These aspects will be refined during the design development of the concept plans.
