This report is an addendum to the Boston Redevelopment Authority’s *Boston Business Patterns 2016*. The Boston Business Patterns report provides analysis of establishments and employment throughout Boston, and this addendum provides additional data about individual neighborhoods. Boston's neighborhoods each have unique business patterns, and these patterns are analyzed here using the U.S. Census Bureau’s Zip Code Business Patterns dataset. Additionally, spatial maps show the geographic distribution of business in the neighborhoods, using InfoUSA data.

In many cases, this addendum uses the same data as Boston Business Patterns 2016. However, that is not always the case, especially with citywide data, and so the sum of the individual neighborhoods in this addendum may not equal the citywide trends reported in the Boston Business Patterns report.
DATA AND METHODOLOGY

The main data source for this report is the 2013 Zip Code Business Patterns (ZCBP), published by the U.S. Census Bureau. Boston neighborhood boundaries in this report are thus based on ZIP codes; a table listing the ZIP codes for each neighborhood, as well as a map of the neighborhood boundaries, can be found in the next pages of this report. To create the employment maps shown for each neighborhood, InfoUSA data was used. While the dataset is not as complete or consistent as the ZCBP, it contains establishment street addresses. This allows us to provide a visual representation of the businesses' spatial distribution, but it should not be cross-referenced with the tabular data from the ZCBP.

For each zip code, ZCBP provides the total private sector employment, along with a matrix of the number of establishments, with industries on one axis and employment-size class on the other axis. ZCBP includes private sector payroll jobs only, excluding government and non-payroll (self-employed or working in family business) employment. Industries are defined by the North American Industrial Classification System (NAICS). Size classes represent ranges of payroll employment count. The actual number of jobs in each industry or size class is not directly stated in the data due to disclosure restrictions – aimed at protecting individual businesses’ privacy – but can be estimated from the number of establishments.

To estimate the actual number of jobs, we computed the mid-point of each employment-size class (i.e. for the employment-size class 100-249, the mid-point estimate of employees is 174.5). Then, the number of establishments in each range was multiplied by the employment mid-point (i.e. if a ZIP code had 3 health care establishments with 100-249 employees, we multiplied 3 by 174.5 to arrive at an employment estimate of 523.5 employees in health care). This procedure was performed for each industry row to obtain a provisional, unadjusted estimate of employment within a ZIP code across each industry. Total employment is the only employment figure given at the ZIP code level, so our estimates for each industry had to add up to this total. Because the sum of these mid-point estimates does not match the total actual employment figure for the whole ZIP code given by the ZCBP (the mid-point estimates tend to overstate actual employment), the mid-point estimates had to be adjusted. To adjust the figures, we first identified employment for establishments in the largest, open ended, size class (1,000+ employees). Employment for these establishments was determined by identifying each individual establishment and actual employment where possible, utilizing the BRA’s 2013 report “The Largest Employers in the City of Boston,” and some additional research to update that report where necessary. If no employer could be identified, the establishment was assigned exactly 1,000 employees.

Once the largest establishments with 1,000+ employees were computed, we simply calculated an adjustment factor by taking the actual total employment figure and dividing it by the sum of the mid-point estimates and 1,000+ employment size class employees. We then applied that adjustment factor to all employment size estimates, multiplying the estimate by the adjustment factor. This resulted in a table where the sum of the adjusted mid-point estimates by industry equaled the actual total employment given in the ZCBP.

* These zip codes are unique zip codes attached to a single high-volume address.

** Zip code 02467 is excluded from this report. The zip code crosses the borders of Newton, Brookline, and Boston. Only a small portion of the zip code is located in Boston, and the ZCBP data does not identify which businesses in 02467 are in Boston.

*** The following zip codes are located within the city of Boston, but have no businesses: 02204, 02206, 02266, 02284, 02293, and 02298.

1: The Zip Code Business Patterns does not report industry-level employment at the zip code level, and so employment numbers are imputed.

*NOTE: Though this number represents a small decrease from the 2011 ZCBP data, other data sources do not find a decrease in jobs. The U.S. Census Bureau’s LODES dataset finds an increase from 1,641 jobs in 2011 to 1,692 in 2013.
